

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

THE

Journal of the Society of Arts,

AND OF

THE INSTITUTIONS IN UNION.

113TH SESSION.]

FRIDAY, NOVEMBER 23, 1866.

[No. 731. Vol. XV.]

Announcements by the Council.

ORDINARY MEETINGS.

Wednesday Evenings at Eight o'clock:—

NOVEMBER 28.—“On the Effect of Limited Liability Partnership on the Progress of Arts, Manufactures, and Commerce.” By WILLIAM HAWES, Esq., F.G.S.

DECEMBER 5.—“On the Trade in Foreign Cattle.” By JOHN IRWIN, Esq.

DECEMBER 12.—“On Old London: its Streets and Thoroughfares.” By J. G. CRACE, Esq.

DECEMBER 19.—“On the Study of Indian Architecture.” By JAMES FERGUSON, Esq., F.R.S.

CANTOR LECTURES.

The first course of Cantor Lectures for the present session will be “On Pottery and Porcelain,” and will be delivered by William Chaffers, Esq. It will consist of six lectures, and will commence on Monday evening, the 21st January next, and be continued on succeeding Monday evenings.

The second course will be “On Music and Musical Instruments,” to be delivered by John Hullah, Esq. Arrangements for a third course are in progress.

The lectures will commence each evening at eight o'clock, and are open to members, each of which has the privilege of introducing one friend to each lecture.

SUBSCRIPTIONS.

The Michaelmas subscriptions are due, and should be forwarded by cheque or Post-office order, crossed “*Coutts and Co.*,” and made payable to Mr. Samuel Thomas Davenport, Financial Officer.

A new list of members of the Society has been printed, and any member can have a copy sent to him on application to the Secretary.

Proceedings of the Society.

FIRST ORDINARY MEETING.

Wednesday, November 21st, 1866; Sir THOMAS PHILLIPS, Q.C., F.G.S., Chairman of the Council, in the chair.

The following candidates were proposed for election as members of the Society:—

Aston, J. Wood, Cradley, near Birmingham.
Bellows, John, Steam Press, Gloucester.
Birt, William Jacob, 23, Sussex-gardens, Hyde-pk., W.
Bond, John James, 39, Queen Anne-street, W., and Public Record Office, E.C.
Bosanquet, Horace Smith, Broxbournebury, Huddesdon.
Bradley, Lonsdale, Prior's House, Richmond, Yorkshire.
Brett, Jacob, Portland Hotel, Great Portland-street, W.
Bryceson, Henry, Brook street, Euston-road, N.W.
Carr, Jonathan, Twerton Mills, Bath.
Clarke, Samuel, 110, Albany street, N.W.
Clay, Rev. Walter L., M.A., 30, Harewood-square, N.W.
Colls, Benjamin, 28, Moorgate-street, E.C.
Cooke, William, 12, Friday-street, E.C.
Dixon, John, 5, Abchurch-yard, E.C.
Ferguson, Robert, Morton, Carlisle.
Ferrabee, James, Port Mill, Brimscombe, near Stroud, Gloucestershire.
Freeman, John, Woodland House, Falmouth.
Gill, Henry Septimus, Tiverton.
Harrison, J. S., F.R.C.S., Lancaster.
Henry, Sir Thomas, 23, Hanover-square, W.
Hill, William, jun., 60, Bishopsgate-street-within, E.C.
Hynam, John, 7, Wilson-street, Finsbury-square, E.C.
Ince, Joseph, 26, St. George's-pl., Hyde-pk.-corner, S.W.
Lambert, William, 4, New Basinghall-street, E.C.
Layton, Charles Edwin, 150, Fleet-street, E.C.
Le Braithwaite, Charles, Jun., Kendal, Westmoreland.
Mair, Robert H., 65, Ludgate-hill, E.C.
McNeill, James, 35, Hopeton-street, Belfast.
Murray, Robert, Kinnahaird, Dingwall, Ross-shire, N.B.
Naylor, William, Manor-place, Paddington-green, W.
Patalano, Enrico, 5, Laurie-pl., Percy-cross, Fulham, S.W.
Perry, Joseph John, 37, Red Lion-square, W.C.
Phillips, Charles Thomas, Windsor.
Pols, John A., 26, Bucklersbury, E.C.
Pugh, Edward, Wrotham House, York-rd., Holloway, N.
Richardson, John, Tutbury, near Burton-on-Trent.
Sanguinetti, Francis B., 63, Jermyn-street, S.W.
Shields, John, Durham.
Slater, James A., 23, Denmark street, Soho, W.C.
Sorby, Thomas Charles, 27, Brunswick-square, W.C.
Strutt, The Hon. Arthur, Milford, near Derby.
Tonks, William Henry, Moseley-street, Birmingham.
Trewby, William George, Coburg-house, Waterloo-rd., S.
Watts, Isaac, Cotton Supply Association, 1, Newall's-buildings, Manchester.
Williams, Oliver John, Harwich.
Young, H., 16, Carthusian-street, Aldersgate-st., E.C.

The CHAIRMAN delivered the following

ADDRESS.

The duty of delivering the opening address of the session is imposed on your Chairman, and I owe to the favourable opinion of my colleagues in the Council the honour of again presiding over

their deliberations. Permit me to say, in all sincerity, that I undertook the task with hesitation, familiar as I am with the marked ability, the energetic spirit, and the unwearied devotion to the interests of the Society which characterized my esteemed predecessor, Mr. Hawes, who, for the term of three years, presided over our deliberations with so much efficiency and success.

At the commencement of each session our attention is naturally directed to the losses we have sustained among our members; and those of our body who have been removed by death in the year which has now closed include men who had rendered services to the Society, and possessed claims to the grateful recognition of the public.

The first of our members in order of time of whom we were deprived last year was Captain Fowke, R.E., who died suddenly from the bursting of a blood vessel on the 4th Dec., 1866. As a man of science, possessing great fertility of invention, he held the highest reputation amongst his brother officers of the Royal Engineers. He was secretary of the English Commission in the Paris Exhibition of 1855, and afterwards became engineer of the South Kensington Museum. Called on to design the gallery for exhibiting the pictures given by Mr. Sheepshanks to the nation, he, in concert with Mr. Redgrave, R.A., reduced to an accurate formula the principles for building a picture gallery so that the paintings might be seen without glitter or reflection. He evinced great capacity for economising the consumption of materials, and many sheds for volunteer corps have been constructed from his plans at small cost. He prepared one general plan for the Horticultural Gardens; and the designs for the conservatory, so greatly admired, as well as for the south arcades of the gardens, were supplied by him. In this work he revived the use of terra cotta, which had been so much employed as a material in the architecture of Italy. He had completed before his death the greater part of the designs for the South Kensington Museum, and it will be possible from the materials he has left to execute his intentions. He was the architect of the International Exhibition of 1862, the object of the Commissioners being to fill a large space at a limited cost in such a way that the building might be made permanent. The structure was pronounced by competent judges most successful for the purposes of exhibition, but the House of Commons declined to purchase the building at the cost of the old materials, which were thereupon taken down and removed. In a competition open to the world four judges unanimously awarded the first prize to his design for the Natural History Museum buildings, proposed in 1864 to be erected at South Kensington, and the public

may hope to see that design yet realized. Captain Fowke largely contributed to the decorative use of iron in architectural works, and had he lived would, it is believed, have earned high distinction; but a career of promise was cut short at the early age of 42. Although the plans of the International Exhibition aroused much controversy at the time, there is now no desire to depreciate the abilities of Captain Fowke, and the amiable personal character by which he was distinguished has received just appreciation by all to whom he was known.

Colonel Sir Charles Beaumont Phipps, K.C.B., Keeper of Her Majesty's Privy Purse, was a valued member of the Society; and when the Exhibition of 1851 was matured by the late Prince Consort, Sir Charles performed good service by contributing to the effective organization devised by the Prince for the conduct of the Exhibition. He had been appointed in 1846 private secretary to his Royal Highness, in whose service he continued till the death of the Prince. He was named on the Council of the Prince of Wales for the Duchy of Cornwall, and was made a Knight Commander of the Bath in recognition of his faithful services to Her Majesty. He died on the 24th February, 1866, aged 64.

Mr. Barnett Blake, Secretary of the Yorkshire Union since 1856, and visiting officer to the Society of Arts in that district, died on the 14th March. The ability, earnestness, and fidelity which Mr. Blake manifested in the discharge of his duties were most remarkable. His loss will long be deplored, not only by the institutions whose success he was so anxious and able to promote, but by the Society of Arts, whose educational work in the Yorkshire district he carried on with great efficiency, and he will be especially missed at the annual conferences of the Institutions, in which he always took a prominent part.

Mr. Charles Wye Williams died on Monday, April 2nd, aged eighty-seven. In 1823 the City of Dublin Steam Packet Company was formed, under the style of Charles Wye Williams and Co. Six steamers were successively built, and the present style of the company was acquired under the provisions of a charter granted in 1828, Mr. Williams continuing, until within the last few years, to be the managing director. Mr. Williams, at a very early date, applied water-tight bulkheads to divide ships into separate compartments. The first edition of Mr. Williams's treatise on the combustion of coal was printed in 1839. He invented a mod. boiler and furnace for the complete combustion of coal, with which he entered the lists in a great competition of makers of marine steam boilers at Newcastle for the £500 prize. professional umpires on that occasion were William Armstrong, Dr. Richardson, and

Longridge, who decided in favour of Mr. Williams's system. For an essay on "The Prevention of the Smoke Nuisance," Mr. Williams received, in 1856, the Society of Arts' £25 Gold Medal, the value of the prize being enhanced by its presentation by the late Prince Consort.

Mr. Richard Garrett, the eminent agricultural implement manufacturer, died on the 26th June, in his 60th year. While Mr. Garrett was yet a young man—in the spring of 1836—the business of his father at Leiston, Suffolk, to which place his grandfather had gone as a sickle maker and blacksmith in 1778, was relinquished in his favour. At that time about 60 men and eight or ten horses were employed, but no steam power had yet been called into play. The once small village has now become a town of more than 2,000 in habitants, all dependent on the Leiston works. The 60 workpeople have increased to 600, the horse power has given place to steam, and the name of Garrett has become known throughout the world.

Mr. Robert Temple, Master of the Supreme Court at Mauritius, died in July, having held that appointment three years, and been previously, for eighteen years, Chief-Justice of British Honduras, where he did much to call attention to and develop the industrial and commercial resources of the colony. He was elected a member of the Society of Arts in 1855, but even previously to that time, while in Honduras, he forwarded numerous interesting and valuable contributions to the *Journal* upon the resources of that colony. On his return to England he was a frequent visitor at the house of the Society, and took much pleasure in attending its meetings.

William Fisher Hobbs, a distinguished agriculturist, died on the 11th of October. He was a highly successful breeder of stock; farmed largely and well; and was one of the founders of the Royal Agricultural Society of England, of the Council of which he was long a distinguished member.

The Right Hon. Sir James Lewis Knight Bruce, D.C.L., F.R.S., and F.S.A., late Lord Justice of the Court of Appeal, died at Roehampton Priory, Surrey, on the 7th inst. He was born in 1791, was entered as a student at Lincoln's Inn in 1812, and was called to the bar in 1817. After attending the Welsh Circuit for some time, he joined the Chancery bar, and soon became a leading member of the profession. In 1829 he was appointed a King's Counsel, and in 1831 was returned to Parliament as member for Bishop's Castle, a borough which was shortly afterwards disfranchised by the passing of the Reform Bill. In 1837 the late Lord Justice, then Mr. Knight, applied for the office of the Queen's license to use the name of Bruce, from motives of affec-

tion and regard for the family of his mother, who was descended from a cadet of the house of Bruce of Clackmannan. The length of time which has elapsed since he was in practice at the bar has much effaced the memory of his powers as an advocate; but those who remember him as one of the leading counsel in the court of Vice-Chancellor Shadwell, in the times when the late Mr. Jacob and Mr. Sugden (now Lord St. Leonard's) were also in practice there, speak of him as second to none, either of that day or since, in brilliancy, force, or learning. He had both great quickness and great acuteness of intellect, and his faculty for business was unrivalled. But what he was chiefly remarkable for was his singular gift of language—combining a rare felicity and terseness of expression with a wonderful fluency, yet never wandering from the point. When Parliament decided, in 1841, that two additional judges were necessary for the assistance of the Lord Chancellor, Mr. Knight Bruce was selected for the important office of Vice-Chancellor, received the honour of knighthood, and was shortly after sworn a member of the Privy Council. No amount of labour seemed to distress him. Shortly before the long vacation of 1850, at the most pressing period of the year, the illness of the other Chancery judges obliged him to undertake the whole business of the three courts. He despatched the business with so much discrimination, ability, and good temper, that a public expression of respectful admiration was elicited from the whole bar, in an address from the Attorney-General. When the Court of Appeal in Chancery was organised in October, 1851, Sir James Knight Bruce was selected for the senior Lord Justice, Lord Cranworth being the junior. He was a bencher of Lincoln's Inn. His nephew, the Right Hon. Henry Austin Bruce, M.P., the son of the Lord Justice's elder brother, was formerly Under-Secretary of State, and afterwards Vice-President of the Council.

There remain to be noticed two men, of whom one had never been, and the other had ceased to be, a member of this Society; yet both deserve grateful recognition in this room for services rendered in the promotion of important measures undertaken by the Society. I allude to Sir Charles Lock Eastlake, and the Rev. William Whewell, D.D.

Sir Charles Eastlake, President of the Royal Academy, died at Pisa, on the 23rd of December last. He was born on the 17th November, 1793, was educated at the Charterhouse, and studied at the Royal Academy, under Fuseli. After visiting France, Italy, and Greece from 1817 to 1820, he took up his abode at Rome, where he remained several years. He first exhibited at the Royal Academy in 1823. In 1827 he was elected an Associate of the

Academy, and in the year ensuing he produced his "Pilgrims Arriving in Sight of Rome." In 1830 he attained the rank of Royal Academician, and returned to England. The reputation attained by Mr. Eastlake, both as an artist and connoisseur, led to his appointment, in 1841, by Sir Robert Peel, to the office of Secretary to the Royal Commission of Fine Arts. In 1843 he was appointed Keeper of the National Gallery, an office which he resigned in 1847. In 1850, on the death of Sir M. A. Shee, he was elected President of the Royal Academy, and received the honour of knighthood. In 1855 he was appointed director of the National Gallery; and in that office, by watchful care and by judicious and successful purchases for the nation, he has raised our national collection of paintings from the character of a cabinet to the position of a gallery, which may now well take rank among the great collections of Europe. Sir Charles Eastlake has made several valuable contributions to the literature of the Fine Arts, among which may be mentioned his translation of "Goethe on Colour," "Notes to Kugler's Handbook of Italian Painting," and "Contributions towards a History of Oil Painting." He was one of the trustees of the National Portrait Gallery, a trustee of the British Museum, a Knight of the Legion of Honour, and a Fellow of the Royal Society. Sir Charles Eastlake took great interest in the proceedings of the Society of Arts on the subject of Artistic Copyright, and acted as chairman of the Society's committee which succeeded in procuring the passing of the "Art Copyright Act, 1862."

The Rev. William Whewell, D.D., Master of Trinity College, Cambridge, died on the 6th of March. His father was a carpenter or joiner at Lancaster, and it was intended that William, the son, should follow the same calling. Fortunately, he had been sent to the Free Grammar School of his native town, where he discovered such genius for mathematics, that the head master prevailed upon the young man's parents to allow him to be sent to Cambridge. He entered Trinity College about the year 1813, took his degree of B.A. in 1816, and became a fellow of his college, which was his home for more than half a century. In 1828 he was appointed Professor of Mineralogy, a post he held for four years; and in 1838, Professor of Moral Philosophy, which chair he retained till the year 1855, when he was elected Vice-Chancellor of the University. He succeeded to the Mastership of Trinity in 1841. In 1820 he had been made a fellow of the Royal Society, in the labours of which he always took a prominent part, as well as in those of the British Association for the Advancement of Science, over which he presided at Plymouth in 1841.

Members will recollect that when a course of lectures was delivered before the Society in 1862, on the results of the Great Exhibition of 1851, the inaugural lecture was given by Dr. Whewell, the subject being "The General Bearing of the Exhibition on the Progress of Art and Science." He also in 1854, on the occasion of the Society's Educational Exhibition, delivered a lecture on "The Industrial Helps to Education." Besides great special knowledge on particular subjects, he was probably, of all his contemporaries, the man of most universal information. His scientific views were most enlightened, and he was at the same time thoroughly sound as a Christian. With a rough temper and rough manner he was open, generous, and forgiving. His liberality in money matters was unbounded, and was evidenced by the noble provisions made, both in his lifetime and at his death, for the college he so much loved.

The address of your Chairman is intended to indicate the policy which the Council design to pursue during the session on which they are entering, but any exposition of intended action which did not connect the history of the past with the policy of the future would be deficient in interest and of doubtful advantage. With Societies as with individuals gradual growth is the foundation of progressive improvement and of increased usefulness, and as in the natural world the flower or the tree owes its value to successive stages of existence, so in man's works the harvest of one period may be due to the seed-time of many former seasons.

Amongst the anticipated triumphs of art and industry in the coming year, none will be regarded with more interest by this Society than the Universal Exhibition to be held in Paris, which will be the second display of that character undertaken in the French capital. When the Prince Consort explained the views by which he was prompted to originate and direct the first great exhibition in this country, he stated that the Exhibition of 1851 was intended to give us a true test and living picture of the point of development at which the whole of mankind had arrived in the great task of employing science, industry, and art in the service of man, as well as a new starting-point from which all nations would be able to direct their own future exertions. The language then impressively used by His Royal Highness may be recalled by us with advantage—"Science discovers the laws of power, motion, and transformation; industry applies them to the raw matter which the earth yields us in abundance, but which becomes valuable only by knowledge; art teaches us the immutable laws of beauty and symmetry, and gives to our productions forms in accordance with them."

In the opening address of last session

predecessor gave expression to the sanguine expectations which have been formed of the Paris Exhibition of next year, and to the belief that such a display will be made on that occasion in every branch of art and manufacture as has never yet been equalled in extent or interest.

The Exhibition building in the Champ de Mars is rapidly approaching completion, and rises from the surrounding park like a gigantic Coliseum. The ground plan is that of a large oblong figure with straight sides and rounded ends, something like, but not an ellipse. The longer axis forms a line from the Pont de Jena to the Ecole Militaire, and is 535 yards long, and the smaller axis, which is at right angles to it, is 415 yards in length. The building is of one storey only, and covers a space of about 35 acres. In addition to this building the park itself is rendered available for the display of articles in two of the ten groups into which the exhibition is divided. Those two groups will include articles for which the interior of the building is not suited, such as agricultural implements and model buildings, as well as machines and apparatus for the exhibition of which the direct application of fire is necessary. The building itself has been specially arranged so as to present a division or separation of the objects exhibited, not only by countries, but also by classes, an idea which is not new, for it was actually proposed by this Society for the Exhibition of 1862; but at that time, for reasons unnecessary to enter into here, that plan was not adopted. The building presents a series of concentric passages, in juxtaposition with each of which one of the groups into which the classification is divided will be shown, whilst each country has a segment of the oval divided by passages radiating from the centre; so that in passing round the building by any one of the concentric passages, we shall come upon each country in succession, and shall find in each group objects of the same class.

The system of classification which has been adopted differs entirely from any hitherto devised, and forms a special feature of the Exhibition, the shape and arrangements of the building having been specially adapted for the display of the objects thus classified. The classification is based on the idea that these exhibitions are intended to bring into notice all the resources which industry can create for satisfying the wants of mankind, and the Exhibition is divided primarily into groups, which are intended to correspond with the great wants of the human family. The wants thus common to all people are divided into the following departments:—

d.
ing.
ings.

Raw materials and their treatment.

The liberal arts.

The fine arts.

These divisions are considered by the French authorities to represent everything connected with the industry of a people, and they form the basis of the following groups:—

1. Works of art.
2. Materials used in the liberal arts.
3. Furniture and articles necessary for dwellings.
4. Clothing and articles required for the person.
5. Products, raw and manufactured, connected with mining industry, forestry, &c.
6. Apparatus and processes used in the arts.
7. Food (fresh and preserved) in various states of preparation.
8. Live stock and specimens of agricultural buildings.
9. Growing vegetable products and specimens of horticultural apparatus.
10. Articles exhibited with the view of improving the physical and moral condition of the people.

These ten groups are again subdivided into classes, amounting in all to ninety divisions.

The classification adopted in our Exhibition of 1851, and which, with certain modifications, was followed both in Paris in 1855, and in London in 1862, consisted of four great departments:—

1. Raw materials which nature supplies for the industry of man.
2. Machinery by which man works upon those materials.
3. Manufactured articles produced by man's labour.
4. The art which man employs to impress them with the stamp of beauty.

These departments were again subdivided into classes, which amounted in all to 30 in 1851, and to 36 in 1862.

The proceedings in Paris are under the management of a Commission, of which the Prince Imperial is honorary President.

The English arrangements are entrusted to the Government Department of Science and Art, aided by a Royal Commission, of which His Royal Highness our President is Chairman, and on which the Council of this Society is represented by your Chairman and other members.

The London Committees for the allotment of space in most of the classes have held their meetings at the house of the Society, under the superintendence of your Secretary, and have divided the space placed at their disposal.

At the former Exhibition of 1855 the members of the Society, in their collective character, paid a most interesting visit to Paris, and it

will be a question for consideration whether a similar course may not be advantageously adopted in the coming year. Such a meeting of gentlemen interested in the various branches of art and manufacture would doubtless afford many opportunities for the interchange of valuable information, as well as for pleasant social intercourse, and the French authorities would probably grant special facilities to an influential body of visitors for an intelligent and careful examination of many of the leading manufactories and public works in and near the French capital.

It is the anxious desire of the Council that the industry and art of this country should be adequately represented at the Exhibition, where the best productions of France in their respective classes will assuredly be found, and where the great skill and taste of the French workman in many departments of labour will receive ample encouragement. Exhibitions of works of industry and art, especially those of an international character, have been, and are watched with great interest by the Society.

Members present are, no doubt, aware that previously to 1851 an active part was taken by the Society in establishing from time to time exhibitions of the products of industry and art, and that the preliminary measures for holding the Exhibition of 1851 were organised by the Society, under the direction of their President, and the plan then sanctioned by H.R.H. included the establishment of periodical Exhibitions. But for the active labours of the Council, and the generous support of the members of the Society, the Exhibition of 1862 would not have been undertaken, and the Exhibition of 1851 might have had no successor in this country.

The Council collected and published, at considerable cost, the reports of the juries on the 36 classes into which the Exhibition of 1862 was divided, a work which the Commissioners declined to undertake, and which, notwithstanding its great interest, would, but for the intervention of the Society, in all probability have never been given to the world; and yet in no other way could an accurate or a faithful estimate be supplied of the remarkable productions exhibited on that occasion, and all who are familiar with this valuable collection of reports will be materially assisted in appreciating the extent, the grandeur, and the value of the Exhibition of 1862.

The Examinations conducted by the Society in the various subjects of education continue to afford valuable encouragement to artisans and other working men, as well as to those members of other classes who desire to improve and extend the school instruction they may have acquired in early life. Those Examinations, embracing a great variety of subjects, including uage, literature, science, and the mechanical

arts, have, year by year, produced an increasing number of students. Propounded by the Society in 1863, the system has extended itself, through the instrumentality of the Local Educational Boards, to about 100 of the most important centres of population in the United Kingdom; and those Boards, for the most part, have not only assisted to conduct the Society's Examinations, but have held other preparatory examinations with the view of enabling younger and less-advanced persons to become in after years candidates for the Society's certificates and prizes. By such means the Society has, both directly and indirectly, afforded widespread encouragement to the education of adults of the industrial classes, and the example which was set by the Society has been effectively followed by the Government Department of Science and Art in the system of annual examinations which is conducted by that department, and by the Universities of Oxford and Cambridge in their systems of local examinations, all of which resemble in their principal features the plan originated and still conducted by this Society.

Although the number of students examined this year is less than in 1865, when they amounted to 1,199, they exceed by 29 the candidates in 1864, when the number examined was 1,068, and we may hope next year to witness a continuance of that progress which, since these examinations were established, has characterised this important branch of the labours of the Society, which the Council propose to continue without change.

The money value of the prizes gained in 1865 was £211 5s., and in this year £233 5s., including that of the Prince Consort and those of the Royal Horticultural Society.

The Prince Consort's prize is won this year by James Rigby Smith, of the City of London College, who, in the present and four preceding years, obtained seven first-class certificates.

The Council is deeply sensible of the importance of every agency for encouraging young people, whether male or female, to prolong their school life, by dividing their time between study and labour. Those who have paid most attention to the elementary education of the working classes, and are most familiar with their condition and character, have come to the conclusion (reluctantly it may be) that the school life of the working man's child cannot be much prolonged; that, in the conflict between the school-room and the workshop, he will be early removed from the former; and that, if his school instruction is to be continued, it must be in combination with the latter.

We daily see how much can be done in the work of self-improvement by lads who work during the day, and afterwards attend evening schools. Hence we believe in the importance

of the work the Society has undertaken by its system of examinations, and we trust that the future progress and extension of this work may fully answer the expectations of the Council. The expenditure of the Society in this branch of its operations is liberal; the examiners engaged are men of distinction, and it is hoped the results may increase year by year, and thus leaven with intelligence a growing number of our people.

For the last two examinations the Society has enjoyed the great advantage of the co-operation of the Royal Horticultural Society, who have liberally offered prizes to candidates in botany and the practical arts of cultivating fruits, flowers, and vegetables; and this example has been followed by the proprietors of the *Gardener's Chronicle*. I am also happy to say that for next year's Examination the Royal Geographical Society offers an additional prize to candidates in the subject of Geography. If other societies and public bodies would unite in like manner with this Society, in extending a knowledge of the examinations, in offering encouragements to those who may become candidates for the Society's rewards, and in publicly recognizing the value of its certificates, the system would produce greater results, and more public benefit would flow from the exertions of the Society.

Art-workmanship and the improvement of the taste and skill of art-workmen are subjects which have for several years engaged the attention of the Council. The Exhibition of 1862 brought under the public eye the works of skilled artisans of our own and other countries in various departments, and the Council, sensible of the importance of stimulating the English workmen to rival the best workmen of other countries in their several employments, appointed in 1863 a committee to consider and report on the subject of art-workmanship; and, on the recommendation of that Committee, the Council offered prizes in that year to the amount of £162 for the successful production from prescribed designs, in various materials, of representations of the human figure and of ornamental works. In 1864 and 1865 the plans of the Council were enlarged, and competition was invited on a much extended scale,—prizes to the amount of £623 in the former and £666 in the latter being offered by the Society. Some disappointment was felt that the large sums offered by the Society in prizes did not produce a larger number of prize works, the sums awarded by the judges being in 1864 £109, in 1865 £274, and in 1866 £174. A discussion on the subject took place in these rooms on the 2nd March last, when the whole question was fully considered and several suggestions were made with the view to a reconsideration of the character of the prizes to be offered and the conditions of competition. These suggestions were taken into considera-

tion by the Council, who introduced modifications of their former scheme. In the *Journal* on the 4th May last they inserted a programme of the scheme for the present session, under which prizes to the amount of £636 have been offered for public competition in the production of carved works in marble or other stone or in wood or ivory, *repoussé* works in any metal, chasing in bronze, etching and engraving on metal, enamel painting on copper or gold, painting on porcelain, decorative painting, inlaid work in wood, ivory, or metal, cameo cutting, engraving on glass, wall mosaics, gem engraving, die sinking, glass blowing, bookbinding and leather work, embroidery, illuminations, &c.

It will thus be seen that the plans of the Council extend to a great variety of the employments of art-workmen, and that the rewards they offer for excellence, both in design and in workmanship, are numerous and substantial.

It seems to the Council important to enlist the sympathies and obtain the co-operation of the wealthy City Companies in the movement they have undertaken, and, bearing in mind the influential share taken in former ages by Corporate Guilds in fostering the skill and industry of the artisan classes, the Council addressed a circular to many of the City Companies, explaining their plans, and suggesting how important would be found the co-operation of those influential bodies in the work, either by the offering of prizes themselves for works connected with the industries to which their guilds originally belonged, or by contributions made to the prize fund established by the Society. Two Companies, namely, the Salters and Plasterers, immediately supported the movement, one by giving a donation, and the other by offering special prizes, to be competed for by artisans, apprentices, and students. The Coach and Harness Makers Company have contributed prizes to be competed for in the Society's Examinations; and the Council have reason to believe that similar contributions, as well as contributions to the Art Workmanship Prize Fund, are at this moment under the consideration of the governing bodies of several important companies. The Council trusts that these influential corporations will go hand in hand with the Society of Arts in the kindly recognition and judicious encouragement of the artisan class.

The Committee appointed by the Society in 1865 to consider and report on the state of musical education at home and abroad, of which His Royal Highness, our President, is chairman, pursued their investigations actively and usefully. The Committee obtained full information of the constitution, present state, and working of the Royal Academy of Music, and of the other schools for affording musical instruction in or near London, as well as of the

provisions existing in our cathedral churches for teaching church music. Through the Foreign Office reports were obtained of the regulations and condition of the several musical Academies at Paris, Munich, Vienna, Prague, Leipzig, Milan, Naples, and Berlin, whilst by means of the personal visit of the Secretary of the Society to Brussels and Liège, reports were obtained on the musical institutions of those Belgian cities. Many of the most distinguished musical authorities of this country, both professional and amateur, either appeared personally before the Committee, or favoured them with written explanations of their views. By these various agencies there has been collected a large mass of very valuable evidence, together with suggestive information and opinions, which have been published from time to time in the *Journal*, and more recently those materials, together with the first report of the Committee, have been published in a collected form, and are submitted by the Council to the consideration, not only of the members of the Society, but of all who take an interest in the musical education of our people. It may be truly said that there are but few in this day to whom the subject does not commend itself; and the wide cultivation and practice of music render it unnecessary to dwell on the value and national influence of this branch of the fine arts.

The Committee did not consider it within their province to inquire into the relative merits of the various systems of teaching music, but their attention was, for the most part, directed to a consideration of the principles and nature of the administration by which, in their judgment, the musical education of the people of this country may be conducted on a scale, and with benefits at least equal, to those of Continental Academies. The Committee reported the following conclusions:—

1. That adequate parliamentary funds, with ministerial responsibility for their expenditure, are essential to the establishment and maintenance of a National Academy of Music worthy of its object.

2. That gratuitous education should be afforded in such Academy to a limited number of persons having great musical gifts, who, after proper training at the public expense, would engage to devote their talents to the service of the public as professors of the art of music; and that the form in which parliamentary assistance could be best afforded would be by scholarships, which should be held by candidates who, in open competition, had proved that they are endowed with the gift of musical ability. That besides the training of free scholars, the Academy should be open to the public at large on the payment of adequate fees, which might be

graduated according to the musical ability of the pupil, and be auxiliary to the support of the institution.

3. That as soon as the Institution shall obtain public confidence it may be hoped the cathedrals and other corporations would provide the means of sending to the Academy young persons of musical genius; and that it be recommended to the Society of Arts to set the example of such endowments by establishing a limited number of scholarships.

4. That before Parliament can be asked to increase its present vote to the Royal Academy of Music the Academy should provide, through the voluntary aid of the public, permanent and suitable premises, possessing all requisite facilities for study and practice.

In a subsequent report, the Committee expressed their opinion that at present about 200 students might be fixed on as a proper number to receive gratuitous training, and that the cost of properly educating that number of free students would be £15,000 a-year, being an average charge of £75 a-year for each student.

The reports of the Committee have been under the consideration of the Council, who agreed to communicate them to such bodies and persons as may be named by the Committee, with the view of ascertaining how far they may be disposed to co-operate in promoting the objects recommended by them; and they have, in the first instance, by circular to the members of the Society, invited their co-operation.

The subject of the musical education of our people is now fairly submitted to the judgment of the public; and it will be for the Legislature to say whether parliamentary funds shall be contributed, under appropriate ministerial responsibility, for the establishment and maintenance of a National Academy of Music.

It will be in the recollection of many of the members of the Society that a committee was appointed by the Council in the session of 1867-8 to inquire into the subject of copyright in works of the fine arts, of which the late Sir Charles Eastlake, then President of the Royal Academy, acted as chairman. That committee received from Mr. Robertson Blaine an accurate and comprehensive report of the laws affecting copyright in works of the fine arts, and after very careful consideration of the subject reported that the laws of British artistic copyright were defective and unjust, because they afforded no sufficient protection to artists against the piracy of their productions, and no redress to purchasers for the invasion of their property; that by reason of the defective state of the law direct encouragement was given to an extensive manufacture of spurious works which were sold as originals; that injustice was inflicted on the subjects of

foreign states in which conventions with her Majesty had been entered into for affording, in those states, protection to copyright, and whose works were not protected from piracy in British territories, although protection was afforded in such states to the works of British artists. A Bill, drawn at the request of the Society's Committee by Mr. Blaine, for consolidating the law of copyright, and extending the protection of the law to the works of artists, was approved of by the Council, and, with modifications suggested by the then Attorney-General, was introduced into the House of Commons in the session of 1861, but by reason of the pressure of public business that Bill only proceeded to a second reading.

The law, as it then stood, conferred a copyright in engraving and in sculpture, but none existed in paintings, drawings, or photographs, and it was the object of the Council, whilst giving to artists a copyright in paintings, drawings, and photographs, to consolidate and amend the statute law with respect to engravings and sculpture.

A conference was held on the subject of the Bill with influential members of the Legislature, and acting on their advice the Council resolved to omit from the proposed enactment the consolidation clauses, and to limit its operation to the creation of a copyright in paintings, drawings, and photographs, to continue for the natural life of the artist, and seven years after his death. The Bill, thus altered, was introduced into the House of Commons by the late Attorney-General, and having passed that House, and been considered by a select committee of the House of Lords, obtained the Royal assent in the session of 1862. Was it not strange that until that time our laws gave no protection to artists in the profitable enjoyment of works of genius and imagination, although we acknowledged the rights of labour to be protected in the possession of productions of the rudest industry?

In the early part of the present year a memorial was presented to the Council, signed by a large number of leading artists, painters, sculptors, and engravers, as well as publishers of works of art, in which the attention of the Council was directed to the defective state of the Engraving and Artistic Copyright Acts, and they were asked to prepare such a Bill as would give to proprietors of copyright in works of fine art more effectual protection; the memorialists also suggested that the various international copyright treaties appeared to require that the new Act should, as far as possible, be assimilated to the French law, which appeared to the memorialists to work well, and to prove in France a most effectual bar to piracy. They also brought under the consideration of the Council the effects produced by the employment of photography, whereby every variety of design may be cheaply

reproduced, and the piracy of engravings has thus been carried on in the most unscrupulous manner, the employment of hawkers for selling these dishonest productions having been largely resorted to. The memorialists sought a more effectual remedy than is at present provided for such acts of piracy, and, when offences are committed by persons having no fixed abode, they prayed that means might be devised which would render them liable to apprehension and summary punishment. The Council appointed a meeting with the memorialists, which took place in this room on the 2nd February, and was numerously attended. The various allegations of the memorialists were then considered, and the Council undertook to have a Bill prepared, to remedy, as far as might be found practicable, the evils of which they complained, and, in compliance with their wishes, a committee was appointed by the Council to promote the objects of the memorialists. The general legislation of the year was, however, interrupted by the time which was given by the Commons to one subject, and it would have been useless to invite the attention of the legislature to that of artistic copyright. The Council, however, have had prepared a Bill for dealing with this question in what they believe to be the best and most effective manner. This Bill will be brought under the consideration of a committee specially appointed for the purpose, and it is hoped that in the course of the ensuing session some really effective measure may be passed remedying the evils complained of.

In 1859 a paper was read in this room by Professor Leone Levi on trade marks, the recognition of the right to appropriate such marks, the protection that should be afforded to their enjoyment, and the punishment which ought to be imposed on those by whom they might be pirated.

Although the frauds practised by manufacturers and merchants, in employing as their own marks which had been long enjoyed and extensively recognised to distinguish the productions of others, were on that occasion eloquently denounced, it was not until 1862 that legislative remedies for those frauds were attempted by a statute which bears the title of an Act to amend the laws relating to the fraudulent marking of merchandise.

In February of the present year a committee, which included gentlemen connected with leading manufactures, as well as lawyers and others having special knowledge of the subject, was appointed by the Council to inquire into the laws of England and foreign states upon the subject of trade marks, and to consider if any and what amendments are advisable and essential for the purpose of efficiently protecting the owners of trade marks against the piracy thereof,

the Committee being also empowered to communicate with any committees formed with a similar object in the United Kingdom or in foreign countries.

At the first meeting of the committee it was found that a Bill for amending the Act of 1862, and extending the protection thereby sought to be afforded to the rightful owner of trade marks was in preparation by the direction of Mr. Michael Bass, M.P., one of the members of the committee, and at a subsequent meeting the draft of the proposed Bill was laid before the committee, and, having been considered, met with general approval. A paper of much ability was read here by Mr. Underdown in the course of the last session, which elicited a discussion of more than common interest, and on that occasion a general assent was given to the necessity for a registration of trade marks, and for a summary method of procedure against those who make fraudulent use of them. The committee obtained interviews with the Board of Trade, to whom they submitted their views of the legislation which is required to ensure to the honest trader adequate protection, and they have reason to believe that the provisions of the Bill, and especially that portion of the measure which provides for the registry of trade marks, will meet with the approval of that Board. The subject is one which the Council regard with much interest, and, the committee having been re-appointed, it seems hardly necessary to assure the members that a subject of so much importance to the commercial community will meet with most careful consideration in the ensuing session, and every effort will be made to induce the Legislature to pass an Act which may prevent the abuses which have so long injuriously affected the interests of the honest trader and manufacturer.

The extent and character of the exclusive rights which the authors of useful inventions should enjoy, and the means whereby such rights should be protected, are naturally subjects of controversy, especially in an age like our own, characterised by industrial operations of great magnitude and by continued changes in the processes by which skill and labour are applied to the arts of production. Although letters patent have prevailed in this country from a remote period, and the system received legislative recognition in the reign of James the First, an opinion unfavourable to their continuance, has in recent years attained no slight growth. Extensive changes in the system of procedure under which letters patent are granted, and some in their operation after the grant is obtained, were made by the Act of 1862, which forms our modern legislation on the subject. That statute was preceded by an extensive inquiry conducted by a committee of the Society

appointed in 1849 for promoting the legislative recognition of the rights of inventors. The committee made several reports, in which they affirmed the principles which ought in their opinion to govern the rights of inventors, but the reforms which they suggested applied to methods of procedure rather than to any alterations of the rights conferred on inventors by the patent laws. The legislation of 1852 was not satisfactory, and dissatisfaction with the operation of those laws, in the form of objections to the mode of obtaining patents and of enforcing them when obtained, led to investigations, first, by a joint committee of the British Association for the Advancement of Science and the Social Science Association, and afterwards by a Royal Commission. Many persons eminent in patent law legislation and science entertain the opinion that no exclusive advantages ought to be conferred on the authors of useful inventions. It would, however, seem that the reasoning by which that opinion is supported is based on the imperfect character of our system of patent laws rather than on a denial of the claims of the authors of useful inventions to be suitably rewarded. A return to the spirit of the ancient policy, which regarded the grant of a patent as a privilege and not a right, would diminish the difficulties by which the question is surrounded, and I would venture to suggest that it should be upon this principle that any attempted improvement in the present law relating to patents should be based. Several valuable discussions have taken place in this room upon the subject, so especially interesting to commercial men; and, should the question be brought again before Parliament during the coming session, it will become a matter for consideration whether such discussions may not be profitably revived at some of our meetings.

In the opening address of the last session my predecessor directed the attention of our members to a disease which had appeared amongst cattle in this and other countries, to which the name rinderpest or cattle plague had been given. On that occasion extracts were read from a paper on the murrain which appeared among our cattle in 1769-70, written by Mr. Dossie, a member of one of the then acting committees of the Society, and printed in 1771.* Although the disease is believed to have visited this country on several occasions in the 17th and 18th centuries, it is doubtful whether it prevailed here from 1771 until the recent outbreak.

In 1665, 1714, 1745, and 1769, the disease appeared in England, and on some of those occasions proved for a considerable period extensively fatal. The disease which appeared in 1745 continued its ravages until 1757; and

* See *Journal*, Vol. XIV., p. 105, &c.

previous to each outbreak here the disease prevailed in Western Europe, and is believed to have been imported into this country on each visitation. Wherever, during war, herds of Russian or Austrian cattle followed the movements of armies, the plague appeared and spread through various countries, and France received the disease many times in the last and present centuries.

It has been stated, on reliable authority, that from 1711 to 1714 Western Europe lost 1,500,000 head of cattle by the plague, whilst from 1745 to 1748 three millions of cattle are believed to have perished from the disease in Western and Central Europe. No accurate record exists of the mortality in our own country, but in Cheshire, which then as now experienced the severity of the disease, 30,000 head of cattle died or were destroyed in a few months during the pestilence which commenced in 1745.

The recent outbreak began in the summer of last year, and the disease was first recognised in the neighbourhood of the metropolis in the month of June, under circumstances which indicated that the metropolitan market was the centre from which it radiated, spreading with much rapidity to the dairies of the metropolis and its vicinity, and extending with fatal and alarming celerity throughout the greater portion of the kingdom. That it was introduced from abroad is a conclusion now generally admitted. The experience we have obtained identifies the English cattle plague with the rinderpest of Eastern Europe, which has usually received the disease through cattle sent into Poland and Hungary from the Russian steppes, where they are fed in large numbers in the provinces watered by the Dnieper and its tributaries. Large herds are yearly driven to Poland, Galicia, Hungary, and other portions of the Austrian dominions; and those countries were, in 1862 and 1863, visited by the disease, and lost large portions of their herds.

The cattle plague may be described as a disease of the class of contagious fevers. How long the morbid matter may remain inactive, or how rapidly, or to what distances it may be diffused is unknown, but that it is contagious in a remarkable degree, and may be conveyed in a virulent form by almost any animal or substance with which it has been in contact, are conclusions supported by all the experience we have acquired.

No specific has been discovered which neutralises or expels the poison, and the disease has hitherto proved fatal to a very large proportion of the cattle attacked.

The progress of the disease in this country was for some time most rapid, and it was regarded with terror in many parts of the kingdom; the following extracts, showing the

number of cattle attacked in particular months, are taken from the returns published weekly under the authority of the Privy Council, and are inserted in order to show first the increase, and next the diminution of the disease:—

1865.	July	2,290
	October	7,965
1866.	January	49,280
	February	56,642
	May	8,985
	August	114
	October	21

It will thus be seen that the progress of the disease was slow from July to October, and most rapid from that time to February, when it attained its maximum severity, and afterwards rapidly diminished.

The stock of cattle in Great Britain before the outbreak has been thus returned:—

England	3,383,309
Scotland	968,637
Wales, with Monmouthshire ..	583,701
	4,935,647

The numbers attacked in each of those divisions are thus given:—

		Per cent. of the entire stock.
England.....	198,476	5.866
Scotland.....	46,861	4.838
Wales.....	8,888	1.437
	253,725	5.141

The numbers that either died of the disease, or were killed to arrest its progress, are enumerated thus:—

	Died.	Killed.
England	90,423	77,670
Scotland	28,088	6,263
Wales	5,794	1,180
	124,305	85,013

The numbers recovered or unaccounted for are thus enumerated:—

	Recovered.	Unaccounted for.
England.....	21,689	8,894
Scotland.....	10,707	1,803
Wales	1,117	297
	33,413	10,994

The results thus supplied present some remarkable features, of which we may notice, in the first place, the great severity of the disease in some districts, and the partial or total immunity of others from its ravages.

Before the plague appeared, the county of Chester possessed 129,493 cattle, of which 67,706 were attacked between the end of June, 1865, and the end of October, 1866, being 52.288 per cent. of the cattle of that county. During the same period the cattle attacked in the whole of England, excluding the Welsh counties, numbered 98,476, or 5.8 per cent. of the whole of its stock. Whilst great havoc occurred amongst the choice herds of several English counties, the cattle attacked in Scotland numbered 46,861,

or 4·8 per cent. of the stock of that portion of the kingdom.

In Scotland the attacks varied from 35 per cent. in one county, Forfar, to a small decimal point of 1 per cent. in other counties, both north and south of the Forth; and from 13 per cent. in Kincardine to 244 per cent. in the adjoining county of Aberdeen; whilst, with the exception of a single attack in Inverness, the disease did not appear in any county north of Aberdeen; and eleven Scotch counties escaped its ravages.

In England the severity of the disease varied from 52 per cent. in Cheshire, and a large but not equal visitation in other counties to 290 per cent. in the South Western division of England, whilst total immunity was enjoyed by two English and ten of the twelve Welsh counties, those alone being visited by the disease which border on Cheshire, namely, Flint and Denbigh. Some persons have attributed the immunity from the disease in portions of England, Wales, and Scotland, to the lofty and mountainous character of much of those districts. Many parts of the counties thus spared border, however, on the sea coast, and it seems a more probable conclusion that the inhabitants, being for the most part exporters of stock and rarely importers of any, the disease was never introduced within their borders, and could not infect their cattle.

The official returns notify that of the cattle attacked in Great Britain, 253,725 in number, only 33,413 recovered from the disease. What portions of that number were cured by medical treatment and what varieties of treatment were employed, do not appear in the official returns, but those gentlemen whose opinions seem entitled to the most weight think that medical remedies have proved of small or no value.

The proportion of recoveries to attacks differed largely as well between the several divisions of the kingdom, as between different counties in the same division.

Thus in England the proportion of recoveries to attacks did not quite amount to 11 per cent., and in different English counties the proportion varied from 4 per cent. in the Metropolis, 4·5 per cent. in Norfolk, 6 per cent. in Lincolnshire and Cambridgeshire, 7 per cent. in Kent and Buckinghamshire, and 8 per cent. in Suffolk, to 10 per cent. in the East and West Ridings of Yorkshire, 17 per cent. in Berks and Durham, and 17 per cent. in the North Riding.

In Scotland the difference between recoveries and attacks was still greater; for whilst in that part of the kingdom they amounted to 22 per cent., in Aberdeen the proportion of recoveries to attacks did not exceed one per cent., and in Dumfries and Haddington did not exceed eight per cent., they

amounted in Edinburgh to 18, in Stirling to 22, in Dumbarton to 23, in Fife to 24, in Forfar to 25, in Perth to 26, in Kincardine to 28, in Berwick to 30, and in Clackmannan to 42 per cent.: and Aberdeen, where there were scarcely any recoveries, adjoins Kincardine, where the recoveries were numerous.

The first report of the Commissioners appointed by her Majesty to inquire into the origin and nature of the plague, made on the 31st October, 1865, contained the following passages:—"The practical conclusion at which foreign physicians and foreign governments have arrived—the conclusion that it is better always to kill a diseased animal, or a few diseased animals, where by so doing you can kill an isolated germ of disease, instead of suffering that germ to linger and fructify whilst you are attempting a cure, for the precarious prospect of an insignificant saving—is justified by reason, it is also directly justified by experience, which shows that whilst the plague propagated from a single germ speedily becomes unmanageable, spreads from herd to herd, from provinces to provinces, and from country to country, multiplies in a continually increasing ratio, and exhausts itself only after a ruinous havoc and a long course of time, it may be effectually eradicated by prompt and unsparing measures. The experience of Prussia is especially valuable in this respect. The plague has often appeared, says Professor Gerlach, in the provinces bordering on the Russian Empire in East Prussia, Posen, and Silesia, but it has never, since 1815, penetrated eastwards, even so far as Brandenburg."

Loud murmurs followed the publication of that report, and remonstrances were freely offered against the suggestion that medical science was powerless in the presence of this great calamity; and yet, after a year's further experience, the destruction of the herd in which the disease has appeared is the remedy still employed. It must not be forgotten that from the time this was authorised by the legislature the disease rapidly diminished. In fact, the policeman and the pole-axe are our only aids, the one to ensure the separation of healthy from diseased animals, the other to slaughter not only diseased animals, but also stock which has been exposed to the contagious influence of diseased animals, although the disease may not have been manifested in the stock thus exposed. In the weekly return for the 3rd inst. it is intimated that hope is entertained that it is the last that will be necessary in recording the progress of a disease which so recently as February last attacked 15,706 cattle in one week.

It seems to be now the received opinion that cattle plague may be transmitted from the ox to the sheep, but sheep are far less susceptible to

the disease than cows or other cattle of that species, and a larger proportion of sheep recover than of cattle. The returns published under the authority of the Privy Council contain the following tables in relation to sheep :—

Stock in Great Britain, in	
March last	22,048,281
Attacked	6,826
Killed	1,029
Dead	4,640
Recovered	1,031
Unaccounted for	63

Ireland suffered from the visitation of the cattle plague to a very inconsiderable extent, the disease having appeared only in small districts of two counties, Down and Meath; and the loss of stock in that country was limited to 50 beasts, of which 29 were diseased and 21 healthy animals which had been exposed to the infection.*

It may be thought by some of my hearers that the subject of the cattle plague has occupied more than its due share of this address. The food, and dwellings, and education of the people, are all, however, subjects to which this Society has given frequent and earnest attention, and the magnitude of the visitation of which I have been treating gives to the subject a national importance, and warrants me in extending the inquiry beyond what might otherwise be its natural limits. The actual destruction of meat has been so vast; the effect of this large destruction of food upon the breeding and rearing of cattle is so formidable; the possible return of the disease is a subject of so much apprehension; and the serious increase in price, and the scarcity of animal food from the effects of so wide-spread a malady, are so certain, that the Society could not regard the subject with indifference, and the Council, at a recent meeting, resolved :—

“That a Committee be appointed to inquire and report respecting the food of the people, especially, but not exclusively, the working classes of the people; and that, having regard to the publications of the Privy Council and other documents, which illustrate the defective amount of nutritious food available for the population at large, the said Committee do report respecting the re-

sources which are, or might be rendered, available for the production, importation, and preservation of substances suitable for food, and for improving the methods of cooking in use among the working classes.”

The Council trust that the patient and careful investigation of a very important subject may conduce to the realisation of plans whereby the food of the people may be increased in quantity, and rendered more adequate to the wants of the community, or whereby the nutritious qualities of food may be increased, and the consumption economised, so that an equal quantity may be found capable of supporting a larger number of people in health and vigour. The Council are gratified to be able to state that the Right Hon. H. A. Bruce, M.P., late Vice-President of the Committee of Council on Education, has consented to act as Chairman of the Committee which it is intended to nominate.

Rinderpest, or Cattle Plague, has not been the only disease which has largely destroyed life during the present year, inasmuch as Asiatic cholera has again visited our shores, and this has been the fourth serious outbreak by which we have suffered since the appearance of that disease in Europe. The epidemic ravaged France, Belgium, and Holland in the early portion of the year, and established itself in this country in the month of July. The matter which is regarded as the origin of choleraic disease has been diffused over England and Wales, and whilst diarrhoea has prevailed to a very large extent, deaths from cholera have been registered in every English county except Hereford and Rutland. In the last quarterly report of the Registrar General is the following passage: “It was only when that element (cholerin) was diffused by water and by the wilful neglect of hygienic precautions that the mortality became appalling.” The places which have suffered chiefly from its ravages are portions of the Metropolitan districts, especially East London, portions of the North Western district, especially Lancashire and Cheshire, and portions of Hampshire, Devon, and South Wales.

From the last quarterly return from the office of the Registrar General, I make the following extracts :—“The mortality of Birkenhead, on the south side of the Mersey, was at the rate of 24 in the 1,000, while the mortality in the borough of Liverpool, on the north bank of the river, was 50. The deaths in Liverpool at the Birkenhead rate would have been about 2,906: the actual deaths were 6,091. The cholera has prevailed, as on former occasions, in particular fields. The London cholera field, by extension down the Thames, reached Ramsgate. The second considerable field lies round the Solent, along the coast from Portsmouth and Southampton to Newport and the Isle of Wight. The Exeter field extended beyond Torbay to Totness and Brixham. The Liverpool field

* Since this address was written, I have been favoured by Professor Simonds with a copy of the address delivered by him at the Royal Veterinary College, on the opening of the present session. His narrative of the appearance of the cattle plague in limited districts of two Irish counties, and the success with which it was stamped out, with the loss of twenty-nine diseased, and twenty-one healthy animals; and his contrast between France and Belgium on the one hand—the sacrifice in the former kingdom being forty-three animals, and in the latter 455 animals slaughtered to prevent the spread of the disease—and Holland on the other, where the destruction of infected animals has been wanting in promptitude, and the disease still prevails to an alarming extent, may be commended to all who regard the prevention of the cattle disease as an object of great national importance.

extended to Chester, Wigan, and Bolton, but scarcely touched Manchester. The Swansea field was visited with extreme severity, and although the mortality was concentrated mainly on Swansea, Neath, and Llanelli, it was felt all over Glamorgan, Carmarthen, and Pembroke, as far as Haverfordwest. The epidemic has been most fatal on the sea coast, in the chief ports of the kingdom. It is by no means capricious, but obeys definite laws. It never destroys the people to any extent where the water supply is pure, or where the hygienic conditions are good, when the authorities adopt judicious and well arranged measures of early treatment and systematic disinfection. Those districts which are supplied with bad water, have no effective system of sewage, have no health officer, and have no precautions in force, should immediately set their houses in order, as they are still in imminent danger."

Fears are expressed in many quarters by thoughtful men that, although the mortality from cholera has greatly diminished, and the area of its attacks is much lessened, it may be expected to re-appear before it departs from our shores; and although this opinion ought not to discourage us, we should firmly resolve not to discontinue or diminish, but, where necessary, to increase and extend those sanitary precautions whereby we have sought protection for our people in the recent crisis.

Physical agencies of a noxious character have not been confined in the present year to the animal kingdom, but the vegetable kingdom has also suffered from influences which in various modes have been found destructive to vegetables, fruit, and flowers. The potato crop has again suffered largely, and the root which forms so important a portion of human food has to no small extent been thrown away in many districts as fit only for animals. Twenty years have now elapsed since the potato crop failed largely for the first time, and the disease has reappeared year by year since that time with a destructive effect varying in intensity. The science of horticulture has hitherto been powerless to avert the evil from our fields and gardens, but I may express an expectation that our added experience and increased knowledge of vegetable life may discover some means whereby this valuable crop may be protected from the destruction with which it is now so often visited.

Amongst the sanitary agencies to which I have alluded, improved dwellings for the people, properly drained and well ventilated, are of primary importance.

The report of the second Special Committee appointed by this Society to inquire into the subject appeared in the *Journal* of May 12th, 1865, and the subject was brought

under the notice of the Society in the address of my predecessor, who presided over the deliberations of that Committee, devoting to the important subject for which it was appointed much time and attention, and it was again submitted to the consideration of the Society in the report made to them by the Council at the Annual General Meeting on the 27th June last. The members were then informed that a Bill had been prepared by a joint committee of this Society and of the Association for the Promotion of Social Science, by which powers were proposed to be conferred on certain bodies to acquire compulsorily property which had become unhealthy or was found a nuisance to the neighbourhood, and to erect thereon improved dwellings suitable for the working classes. The Bill so prepared will receive the careful consideration of the Council.

Our country has suffered many calamities, physical, social, and commercial, during the year now hurrying to its close, whilst famine, fire, and tempest have visited portions of the colonies and dependencies of the Crown; and on the Continent of Europe war has brought about political changes of great magnitude. Amidst, however, those saddening thoughts which arise from political convulsions and natural or social calamities, the future historian, when he chronicles the events of 1866, will be able to point to the completion of the Atlantic Telegraph as one of the greatest—if not the greatest—works of our age, and one of the most remarkable triumphs of man over nature which science has yet accomplished. This achievement is England's contribution, in the present year, to the service of mankind; and, although the importance of ocean telegraphy can scarcely yet be estimated, we may feel proud of a people whose genius, enterprise, and perseverance has thus linked together the Old and the New Worlds. The communication established between this country and America will, in a few years, extend over the globe; and the names of the men, by whom the work was undertaken and accomplished, will be remembered with honour throughout the world.

It is our earnest hope that our closer relations to the United States, whilst it must largely contribute to the extension of our trade with each other, may also preserve in amity two countries between whom peace and good-will ought to prevail. Whilst united they will be all powerful and on their union must largely depend the future of mankind.

It is remarkable how the difficulties which it was supposed would embarrass the satisfactory working of the Atlantic telegraph have rapidly disappeared under the teachings of experience. Many years have not passed away since we were assured by a man of great scientific reputation

that no steamship could navigate between England and America : and we were recently told by many persons that the distance between Ireland and Newfoundland, and the submersion of a cable on the bed of the Atlantic, would be found formidable obstructions to the working of the telegraph. Steamships, however, have navigated the Atlantic, notwithstanding the objections once raised to the enterprise, and the telegraph has done its work on the bed of the ocean without interruption.

It will be satisfactory to the Society to reflect that the labours of Cooke and Wheatstone in the introduction of telegraphy into this country, secured in this room due acknowledgment, and that submarine telegraphy formed the subject of a course of lectures delivered here last year by Mr. Fleeming Jenkin, characterised by much ability.

The Albert gold medal, awarded for distinguished services in promoting Arts, Manufactures, and Commerce, is the greatest distinction the Society is enabled to confer, and this year, when it was bestowed for the third time, it was unanimously awarded by the Council, with the cordial approval of his Royal Highness, the President, to Michael Faraday, for discoveries in electricity, magnetism, and chemistry, which, in their application to the industries of the world, have so largely promoted arts, manufactures, and commerce. Unselfish in disposition, scrupulously delicate in his judgments, distinguished above nearly all the men of his time for physical discovery, a philosopher of the very highest reputation, the Society can hardly be said to have conferred a distinction on one whose merits are recognized in the world of science, and whose labours and discoveries have for nearly half a century contributed so much to advance material progress.

Unhappily the health of Professor Faraday would not permit his attendance at a general meeting of the Society, and I had the honour to be present on the 16th of June last when our late Chairman, Mr. Hawes, accompanied by the Secretary, waited upon the Professor at his request at his residence, and presented to him the Albert gold medal. He then acknowledged with grateful feelings his sense of the recognition by the Society of his services to arts and science.

The members will recall the International Horticultural Exhibition and Botanical Congress which was held at South Kensington in the last summer with much success. This Society being requested by the promoters of that Exhibition to aid the undertaking, offered a sum of £50 in prizes for implements connected with the advancement of horticulture, which the Council were advised would be the best encouragement they could offer to that important undertaking ; and members will have seen by the *Journal* that several of the prizes have been awarded.

The Cantor Lectures may now be regarded as a branch of the Society's ordinary proceedings, and the members and their friends have been attracted in large numbers on the evenings devoted to those lectures. For the ensuing session the Council are happy to announce that they have secured the services of Mr. Hullah, who has consented to deliver a course on music, which, coming from one to whom the progress of music in this country owes so much, will no doubt excite a large amount of interest.

Mr. Chaffers, whose complete acquaintance with the subject is so generally acknowledged, has undertaken to deliver a course upon pottery and porcelain ; and considering how largely a taste for this branch of art manufacture has advanced of late years, these lectures will doubtless engage the attention of a considerable number of our members. Arrangements are intended to be made for a third course, which will probably include some branch of chemical science affecting Arts and Manufactures.

The bequest of Dr. Cantor, employed in securing the services of lecturers eminent in their respective walks on subjects which interest a large number of our members, has been made an agency of much usefulness, and the audiences have been familiarized with subjects which, although abstruse in themselves, were presented to their understandings in lucid language, and with much felicity of illustration.

The papers that have been announced as to be read before the Society at the Wednesday Evening Meetings previous to Christmas appear to be of a very interesting character.

The Council desire to express their public and grateful acknowledgments to the Board of Examiners, by whose labours the yearly examinations of the Candidates for the Society's Certificates and Prizes have been conducted with results of an eminently satisfactory character ; and also to those Committees which, at the request of the Council, have undertaken important investigations, and enabled the Council to achieve results which would otherwise have been unattainable.

In former addresses from this place the hope has been expressed that we shall year by year witness an addition to the number of those members, who, by contributions to the Society's *Journal*, or to the papers read and the discussions conducted at our weekly meetings, will increase the usefulness and extend the influence of a Society which includes many agencies for promoting the well-being of the community. The meeting of to-day forms our 113th Anniversary, and in an active career, extending over more than a century, the Society has witnessed many vicissitudes. Some of our original functions have been undertaken by kindred societies, but this is the only chartered body

which strives to promote Manufactures and Commerce by the employment in their service of Science and Art. May I venture to impress upon our members that the importance of Arts, Manufactures, and Commerce is not to be measured by the wealth they create or the enjoyments they diffuse. Their advantages must in the end be estimated by the ameliorations they effect in the social and moral condition of the community to whose physical comforts they may have contributed. The great end of our being is the elevation to a better and higher standard of the race to which we belong, and science is only truly valuable when it adds to the moral dignity of man. Increased influence brings with it increased responsibilities; and we shall be judged hereafter not by the extent of our resources, but by the purposes for which our means of usefulness have been employed. Let no man excuse himself on the plea that neither his position nor his abilities qualify him for performing important services, for to such a one we may apply the language of a great poet and good man:—

The primal duties shine aloft, like stars;
The charities that soothe, and heal, and bless,
Are scattered at the feet of men like flowers;
The generous inclination, the just rule,
Kind wishes, and good actions, and pure thoughts.
No mystery is here! Here is no boon
For high, yet not for low; for proudly grand,
Yet not for meek of heart.

Mr. HARRY CHESTER said he was quite sure the members would be very sorry to separate without returning their cordial thanks to the chairman for the very admirable address he had delivered to them. There was a time when it was not thought to be etiquette in this Society to thank the chairman on these occasions, but that feeling had given way of late years to a warmer and indeed to a more common-sense feeling, and they had generally been in the habit of voting their thanks to the chairman for the great trouble he must necessarily have taken in preparing the address at the opening of the Session. If ever there was an occasion on which such a tribute was due, it was the present, when they had been favoured with an address which was full of most valuable matter and had been listened to with the greatest interest and profit. When published he was quite sure his address would be read with pleasure by the members of the Society who had not had the opportunity of hearing it. He begged to propose a cordial vote of thanks to Sir Thomas Phillips for the address he had delivered.

The motion having been seconded by Mr. W. S. RUMSEY, was carried by acclamation.

Sir THOMAS PHILLIPS thanked the meeting very much for the kind way in which they had received his endeavours to discharge a duty which, though not of an unpleasant kind, was certainly rather laborious. He had done his best, and he thanked them for having received that best in so kind a manner.

PARIS EXHIBITION, 1867.

Every week, almost every day, now produces a noticeable change in the Champ de Mars. The building is finished as regards its main parts, and all the minor portions of the work are advancing rapidly. A very

considerable portion of the glazing is executed; the fine art courts are all but finished in this respect, as are the intermediate galleries, or courts, for raw materials and manufactured articles, and the glass is being placed in the immense double range of windows which occupy the whole of the upper portion of the walls of the great machinery and processes court. As regards painting, considerable progress has been made; nearly all the iron work has received two coats of colour, but there is at present some doubt as to the manner in which the decoration is to be completed. It was originally intended, we believe, that the whole should be in chocolate colour, relieved by lines of gold, and here and there with colour, but the extremely heavy appearance of the outer iron walls and of the interior of the grand machinery court seems to have caused some hesitation; small portions have been painted experimentally of a light coffee colour with lines of positive colour. It does not appear, however, that the specimens produced have given satisfaction. In fact, it seems almost hopeless to do anything more with such an enormous mass of ironwork as the interior presents than to colour the whole surface with one or, at any rate, two neutral tints. Its size, nearly a mile round, and more than eighty feet high, renders ornamentation almost impossible. A few days since a Commission was on the ground to judge of the effect of several turret-like ornaments placed as caps on the great square pillars of the outer circle, and of some coloured escutcheons hung on the faces of the pillars, level with the arched roof, but the effect could scarcely be considered satisfactory.

The workmen are now engaged in finishing the structure of the main vestibule and avenue which extend from the principal entrance of the building to the inner garden. The roof of this avenue has been carried nearly up level with the springing of the roof of the great machine court, and, like it, is lighted by clerestory windows on each side. The façade of this avenue in the central garden consists of a colonnade of three arcades with a large semicircular window above, and the whole is connected with the verandah which encircles the garden. The verandah itself is finished, and has a fine effect, although the painting is not yet done; it consists of a wooden roof, which will be coloured in panels, supported by light iron columns on bold plinths, and with a fascia relieved by curves at intervals; the wall at the back will also be painted in panels.

The fine art galleries which lie around the minor garden are being floored partly with cement and partly with parquet. The walls are plastered here and there with olive and other neutral tints by way of experiment. Light frames covered with white calico are also being suspended from the tie rods of the roof to form a semi-transparent ceiling along the centre of the galleries, a system adopted recently with good effect at the annual exhibitions of pictures in Paris.

In the great machine court, foundations and other preparations are being made here and there. The outer ring of the building, the alimentary court, with its broad verandah, or piazza giving on the park, will very shortly be finished, and already one celebrated confectioner has the front of his future shop in place, with his name over it in conspicuous letters. When this circle is thus filled in all round, the heaviness of the outside, now so much noticed, will, to a great extent, disappear.

The grounds, or *parc*, have undergone a great change within a week or two; buildings of every kind are growing up with extraordinary rapidity. The most conspicuous and the most forward are the picture gallery and machinery rotunda of Belgium, and the temple and other buildings belonging to Egypt. The largest of these, the Temple of Hothar, is finished as regards the outer walls, and, surrounded by its antique colonnade, forms a very conspicuous object.

The model church for the exhibition of French ecclesiastical decorations and church furniture, utensils, and ornaments, forms now a very pretty object with its

numerous windows, elegant ornamental tiled roofs, and brackets, with niches for sculpture. The large lake near at hand, with its massive rockwork, is ready to receive the water, and the iron framework for the electric light-house is now being placed on the rock. A wooden dioptric light-house, of the ordinary kind, stands at a short distance from this spot.

In another corner of the grounds the International Club-house is approaching completion, and on each side of this building are arcades, each having three ranges of small shops, two within and one on the outer side.

On the French side of the park is a long range of lofty sheds for the exhibition of carriages, and others for the accommodation of those visiting the Exhibition. A large building belonging to the General Society of Bakers; a three-story model lodging-house, erected by the Associated Masons of Paris; and several other buildings, some of considerable size are in progress; and the Imperial Pavilion is nearly finished as regards its shell.

The twelve engine and boiler-houses, with their chimney shafts, will shortly be finished, and they already form very ornamental features in the grounds, being constructed of many coloured bricks, and with great taste.

The corner of the park devoted to the horticultural exhibition is at present in an exceedingly rough condition, but the main works are approaching completion. The rock-work caves and chief earthworks are nearly finished, and over the former are being placed a series of iron joists, which will support the glass floor of the aquariums, which will be visible from below as well as above.

The pathways and flower beds in a large portion of the grounds are laid out, and in many parts the bronzed lamp posts, by means of which the park is to be illuminated, are in place, with their lamps complete. Generally, the works belonging to the French department, out of doors, are in a very forward state, and many foreign flags are flying in various parts of the ground, but neither England nor any other of the great powers have yet made their appearance.

Amongst the buildings in the garden not mentioned above, are model candle works, a crèche, or public nursery, a patent furniture factory, a model glass house, chocolate establishment, a building erected for the Industrial Society of Mulhouse, and a chalet for the society for the protection of animals.

An extremely important work is being carried out on the summit of the hill of the Trocadero, on the opposite side of the river to the Champ de Mars, namely, a reservoir for the supply of water power for the purposes of the exhibition; this reservoir will contain 4,000 cubic metres, and is more than a hundred feet above the level of the Seine; the water will be pumped up into it from the river, and will descend through pipes laid across the bridge of Jena to the exhibition grounds to supply the fountains and cascades, and any water power that may be required.

Amongst the noticeable contributions promised is a series of models and charts, prepared by order of the Isthmus of Suez Company, exhibiting not only accurate representations of the great work in which they are engaged, but also of the machinery and other means employed in its execution.

The lists of exhibitors are being finally revised, and those of a large number of classes have been printed. Amongst the most recent is that of the printers and publishers, a long list, including nearly all the great houses in Paris, and many of the famous provincial firms of Tours and other places. The book trade of France will certainly be well represented.

The Imperial government has issued a notice to artists desiring to have their pictures admitted to the exhibition, that if such works are the property of the government and are in any of the public galleries or establishments belonging to the state, applications for their admission will be immediately considered and decided on; with

respect to works which have been presented to local museums by the government, the artists will have to apply to the provincial authorities. The election of the jury of admission for works of fine art has been deferred, and in consequence of the academy having refused to take part in the election, two-thirds are to be elected by the body of decorated artists and medalists.

The promises which arrive from abroad include some important items. The Austrian Government has ordered to be erected in the park a group of buildings representing the various methods of construction in use amongst the different races which compose the Austrian empire. Not only the buildings themselves, but their fittings, furniture and decorations, will all be the work of native artists and workmen. In connection with these buildings will be a gallery, in which will be established an Austrian restaurant, in which the various viands and drinks in use in the empire will be served by persons dressed in their national costume.

Italy promises a fine collection of furniture, decorated with the beautiful inlaid and mosaic work in wood and hard stones for which several of the cities of that kingdom are renowned, besides many other articles of artistic manufacture.

Germany will be divided into two groups, the Union of the North, to include Prussia, Brunswick, Saxony, Saxe Altenbourg, Saxe Meiningen, Saxe Coburg, Schwartzbourg, Waldeck, Anhalt, Oldenburg, Bremen, Mecklenburg-Schwerin; and the Union of the South, Bavaria, Wurtemberg, Baden, and Hesse Darmstadt. Amongst the promised contributions are specimens of the work of the great gun factory of Messrs. Krupp, of Essen; a gigantic cannon in cast steel is said to be ready; this huge arm weighs 17½ tons, and throws elongated cast steel projectiles weighing half a ton each, the charge required being 60 lbs. of powder.

The Swedish Government, amongst other remarkable objects, will exhibit a complete reproduction of the house occupied by Gustavus Vasa at Ornae, in Delacarla; this curiosity, which is now on view at Stockholm, will represent the ancient architecture of Sweden, together with the fittings and furniture of the time.

Belgium has exhibited great alacrity in her preparations, and will no doubt make an admirable exhibition; the Count of Flanders, brother of the King, and President of the Exhibition Commission, has taken one wing of the Grand Hotel at Paris for several months.

The Oriental nations will, if they fulfil their promises, make a much greater show next year than at any previous exhibition. There seems to have been great doubt whether the Persian Government would move in the matter, but the Persian Minister in Paris, General Hassan Ali Khan, has despatched an officer of the legation to press upon the Government the policy of sending a complete collection of the industrial and artistic products of the country to the Exhibition.

The delegates of many of the classes of French industry have resolved to secure themselves against robbery by means of attendants paid by the whole body of exhibitors in each class, but the jewellers, considering the great value of their contributions, have obtained the promised attendance of two police officers, who will watch day and night over that section of the Exhibition, and the sum of 2,000 francs has been devoted for that exceptional service.

Manufactures.

SELF-FASTENING BUTTONS.—In the *Journal* of the 2nd inst. (p. 762) there appeared a description of a self-fastening button, invented by Mr. Hart. It may be mentioned that Mr. George Bussey has also patented a button, fastened by a rivet, which has a flange at the back, and is fixed by a blow of a set-punch and mallet in front. An advantage specially claimed by the in-

ventor is that the flange at the back, being smooth, is not likely to wear the clothing by friction. A correspondent has also favoured us by sending a button which he "purchased in France about six years ago," and which is fastened by shanks turned down at the back.

Commerce.

OUR TRADE WITH THE EAST AND WEST.—The *Produce Markets' Review* says:—Whenever a derangement is apparent in the movements of the money market, and coin becomes gradually scarcer in the general circulation, the circumstance—in default of any more satisfactory explanation—is usually referred to the drain of bullion to the East. The terms of this stereotyped phrase are too vague to show its significance, and it is not at first sight so obvious why the demand should assume such a character as to be designated by so exhaustive a name, and why it should always be to the east and never to the west. A reference to the official returns for the year 1864, the latest period for which we have complete and reliable calculations, will at once show the different nature of our commerce with the Eastern nations and with those of the West, including under this name the United States, our North American Colonies, Brazil, and Australia. According then to the Government returns, it appears that the value of our imports from Egypt, India, and China, in that year was rather more than £87,000,000, whilst the value of our exports in the same period to those countries amounted to only £34,000,000, thus leaving a balance of £53,000,000, which amount would principally require to be paid in bullion. It is evident, then, that in our commerce with the East—taking the year in question as an average by which to determine the rest—that for every one hundred pounds' worth of goods imported from the East we can barter in exchange only sixty pounds' worth of goods, and must pay the remaining forty almost in cash. Our trade with the West shows a very different result. The value of our imports during the year 1864, from the United States, North American Colonies, Brazil, and Australia, amounted to £42,000,000, whilst our exports reached 46,000,000, showing a balance of 4,000,000 in favour of England. So far, then, as any interchange of commodities takes place between England and the West, it appears that the producing powers of the Western countries is at present insufficient, and they are consequently driven to equalise the balance of trade with money payments. We arrive at a similar result, though not precisely identical with respect to the exact figures, by comparing our exports and imports of bullion from the countries that we have included under the head of West; for whilst our imports of gold and silver amounted to more than £10,000,000, our exports were within £2,000,000. The means of paying for these large imports are of course given by the gold and silver mines of the New World and of Australia, and it is certainly a wonderful fact that the precious deposits should have been placed in the exact spots to foster the growth of new communities, which without their aid would have been unable to pay for the articles necessary to an advanced civilisation, and which without the mines would have either had no inducement to colonise, or if they did colonise would have had to retrograde in civilisation, and go back to a state of nature. If we pursue our inquiries still further, and ask why it is that in the one case our coin appears to be so wholly absorbed, and there is no return trade to answer to our own, the reason will be found in the social habits and mental condition of the East. To assimilate our eastern trade to that which we carry on with the West, we must, first of all, indoctrinate the East with our own advanced civilisation, and convince them that real wealth consists not in the amount of coin and jewellery amassed, but in the pro-

ducing power of the country, the energy and intelligence of the inhabitants. A task such as this, it would require ages to accomplish; and in the meantime it will be our duty to palliate, as far as lies in our power, the evil which we are powerless to prevent—the absorption of our gold and silver bullion by the East; and it is to be hoped that the Legislature will before long find the means of effecting this, without having recourse to the absurd expedient of temporarily extinguishing trade. In the meantime, it is a good sign that the Commission appointed by the Indian Government to inquire into the subject of the currency have recommended the immediate introduction of a gold coinage into India. This, with an extension of the present imperfect note-system, will increase the rapidity of the circulation, and thus tend to diminish the demand for bullion.

Colonies.

AUSTRALIA AND THE FINANCIAL CRISIS.—A merchant's private circular, dated Melbourne, 26th September, says:—"We reported last month that, in consequence of the financial crisis in London, the banks here had been compelled to adopt a stringent policy. This has now been in operation simultaneously in all the Australian colonies for nearly two months, and at a season of the year when both the industrial and trading classes have usually needed and received considerable advances from the banks. It is highly satisfactory to find that this pressure has produced much less disaster than might have been expected. In Sydney and Adelaide it has been severely felt; failures continue, and confidence is affected, though, happily, not as yet to a serious extent. But in Melbourne the community have passed through the ordeal comparatively unscathed. During the past month there has not been a failure of any moment, and at no time has the community been considered sounder than at present. But though there has been comparatively little actual loss, the pressure has had a most prejudicial effect on trade. For several months previous to the opening of the wool season (in October), there is always a great stagnation, which has this year been intensified by the want of the usual accommodation from the banks. Not only have dealers, in consequence, confined their purchases to actual daily wants, but buildings and industrial operations of various kinds have been suspended. From this cause there has been a scarcity of employment for the working classes, and at the same time several articles of first necessity have been unusually dear. This has, of course, reacted on the demand for imports. In addition to these untoward circumstances, some branches of trade have suffered from the overtrading mentioned in our last. As usual, the result has been large sacrifices at auction, which has injured the legitimate merchant. While trade has been thus severely depressed, the holders of goods are not without hope of an improvement. The crisis in London has had the one good effect of checking over-shipments, and in this respect the last advices are satisfactory. Again, the local causes of pressure may be said to have reached their climax. Should the wool season prove early, and of this there is good hope, the improvements may be speedy and effectual. The average production of wool alone in Victoria is now valued at three millions sterling, and as the capitalists of Victoria have made large investments in stations in the neighbouring colonies, the amount receivable from this source considerably exceeds the above amount. As regards the crops, the anticipations are equally favourable. Every vestige of drought has disappeared, the season is most propitious, and from all parts of the country the most satisfactory accounts have been received, both as regards the extent of cultivation and the appearance of the crops."

EMIGRATION.—According to the quarterly return published by the Registrar-General, it appears that during the quarter ended 30th September, the total number of emigrants from the United Kingdom was 47,153, an increase over the number during the same period of the preceding year. Of these about 7,000 went to the Australasian colonies, 4,000 to the North American colonies, and 36,000 (mostly Irish) to the United States.

Notes.

A NEW SUBSTITUTE FOR COLLODION.—M. PEROZ, Fils, has recently discovered a method for obtaining a material possessing the same characteristic qualities as collodion. *La Lumière* says:—This new substance is produced by dissolving silk in a suitable solvent, and then separating the latter by means of dialysis. If the film be of a certain degree of thickness, it assumes on drying a golden tint, but this would no doubt be scarcely perceptible in a thin film, such as would be used in photography. The solvent chosen by M. Peroz is chloride of zinc, which, when kept at a warm temperature, readily dissolves the silk, but if the solvent be not warmed the silk takes a much longer time to dissolve. Before employing the chloride of zinc, it is heated with a small quantity of oxide of zinc, in order to neutralise any excess of acid in the chloride, and then filtered through a piece of fine cambric to remove the superabundant oxide. To separate the chloride of zinc from the solution of silk, M. Peroz has recourse to Professor Graham's method of dialysis. The apparatus for dialysis, which is a kind of sieve, is made by means of a broad strip of gutta-percha, bent round and cemented in the form of a cylinder, at one end of which is fixed a disc of parchment to form the bottom. The apparatus is floated upon a vessel of water, and the silk solution, previously diluted with water to the consistency of collodion, is poured into it. The chloride of zinc percolates through the moistened disc of parchment, and mixes with the water in which the apparatus is floating. In a few days the whole of the chloride of zinc will be found to have become separated from the silk solution, but the presence of a slight quantity of the chloride in the material is of no great consequence, as it merely gives rise to the formation, in the sensitive film, of a minute quantity of chloride of silver. Although M. Peroz does not mention the fact, there is no doubt that a dry film of this substance would be quite insoluble in water. Its employment is very simple. It is first iodised by mixing with it an aqueous solution of iodide, and then dried and sensitised; the exposure and development are conducted in the ordinary manner.

TISSUE PAPER AS A SUBSTITUTE FOR LINT.—The surgeons of Vienna have employed, with much success, the white unsized paper known as *Papier Joseph*, for dressing wounds. It has all the properties of lint, and in towns it may be obtained in large quantities at a very low price. In every way it has all the advantages of lint; it does not change in contact with water; it is a bad conductor of heat, and preserves, in consequence, the wounds from atmospheric influence. From its absorbent nature, it sucks up the matter, maintains the wounds in a state of dryness favourable to healing, and it may be used in certain circumstances more advantageously even than lint.

UNIVERSITY EDUCATION IN SPAIN.—The following royal decree has recently been published in Spain:—"Art. 1st. A Faculty of Sciences shall be established in the Central University, comprising a complete course of instruction up to the degree of doctor inclusively. The courses of the exact sciences, of physics and chemistry, natural history and astronomical observations, will constitute this faculty according to the provisions of the law on public instruction, published the 9th September,

1857. Art. 2nd. The Faculty of Sciences will comprise two sections: that of physical science, mathematics, and chemistry, and that of the natural sciences. The studies will be the same for each up to the degree of bachelor."

PEARS.—In Covent Garden market this week there have been exposed for sale some large pears (*Belle angevine*), ticketed eighteen guineas a dozen.

Correspondence.

THE CONDITION OF THE TEA TRADE.—SIR,—In your *Journal* of the 9th instant appear some remarks under this heading, but as the subject, perhaps, is not one of very great general interest, I should hesitate to trouble you with any observations of mine, were it not for the importance of accuracy of statement in everything appearing in the columns of our *Journal*. The larger portion of the strictures of the writer refer to matters of detail, and are also of an imaginary character; these I shall therefore dismiss with this remark—that those engaged in any trade ought to be the best judges of its details and method of working. I now come to the grand charge of "disorganisation;" this is, indeed, a grave statement, and as it is held to be an impossibility to prove a negative, I must battle with it as best I can; and first of all I would say, the trade are unaware of the fact; but possibly it may be replied, a disorganised body is necessarily unaware of its own condition; but as a disorganised body cannot continue to perform its functions, perhaps the inquiry as to whether the tea trade is doing this may meet the case; and I would with confidence appeal to all the ladies of the land for a verdict in my favour; and I feel certain that—whether it were the lady who calls in her carriage at Messrs. Twining's, in the Strand, or the heroine of the washtub in the remotest village, getting her ounce of tea from the nearest shop—the answer would be, that the supply was both good and cheap. The trade, therefore, cannot be disorganised while the import is larger, and the distribution of the article through the country more active than ever. It does, however, happen that a good deal of tea is being sold at a heavy loss, but this is owing chiefly to too great competition in China, and partly to the depression which the tea market has suffered, in common with every other, from the late panic, the recovery from which is retarded by the growing conviction in mercantile circles of the inadequacy of our currency to our greatly-increased trade since 1844, and the consequent liability to sudden oscillations and high rates of interest, with all their ruinous consequences.—I am, &c., H. C. WHITE, Tea Broker.
London, Nov. 20.

ARTIFICIAL QUININE.—SIR,—In the report of one of Mr. Crace Calvert's (Cantor) lectures, which appeared in a late number of the *Journal*, the hope is expressed that quinine and other costly and valuable organic principles may "one day" be produced or built up artificially in the laboratory. Will you permit me to state that quinine was first produced synthetically by me in the month of October, 1865, and small specimens of this artificial quinine were deposited with the Secretary of the Society of Arts and Dr. B. W. Richardson just twelve months ago. In the *Social Science Review* for December, 1865, I announced the discovery for the first time, and my artificial quinine was exhibited at Nottingham this year at the Pharmaceutical Conference, and at the *soirées* of the British Association. Thus much in justice to myself. For the rest, I must confess that at the present moment (the inquiry having been laid aside for some months past owing to the pressure of other matters), I only possess a very few grains of the substance as the result of two years' labour and considerable outlay; but I see no reason to suppose that a ton of artificial quinine will not be eventually produced at a cost not exceeding the present price of half-a-hundred-

weight of the principle now extracted from the bark of cinchona.—I am, &c., WENTWORTH LASCELLES SCOTT, F.C.S., &c.

Wolverhampton, Nov. 19th.

MEETINGS FOR THE ENSUING WEEK.

- Mon.** ...R. Geographical, 84. 1. Letter of Dr. Livingston from the Rovuma River. 2. Dr. J. B. Maan, "On the Physical Geography of Natal."
- Institute of Actuaries, 7.** Mr. T. B. Sprague, "On the value of Annuities payable half-yearly and quarterly, &c."
- Tues.** ...Civil Engineers, 8. 1. Mr. J. Llewellyn Morgan, "On the Smelting of Copper Ores, with wood as fuel, in Australia." 2. Mr. T. Dawson Ridley, "Description of the Cofferdams used in the execution of No. 2 Contract of the Thames Embankment."
- Wed.** ...Society of Arts, 8. Mr. W. Hawes, "On the Effect of Limited Liability Partnership on the Progress of Arts, Manufactures, and Commerce."

Patents.

From Commissioners of Patents' Journal, November 16th.

GRANTS OF PROVISIONAL PROTECTION.

- Armour plates, fastenings for—2621—H. H. Williams.
- Atmospheric engines—2590—W. E. Newton.
- Baling bands, fastenings for—2726—A. V. Newton.
- Beer casks, tapping—2666—W. R. Lake.
- Blue colouring matters—2666—C. A. Girard.
- Bolt-making machine—2636—H. J. Cooke.
- Bottles—2672—W. Dennis.
- Braiding machines—2694—R. Furnal.
- Breech-loading fire arms, and bayonets for—2642—A. Wyley.
- Breech-loading fire-arms, and cartridges—2613—G. H. Daw and P. M. Parsons.
- Breech-loading fire-arms, and cartridges for—2580—J. von der Poppenburg.
- Brickmaking machines—2594—G. T. Bousfield.
- Buttons—2781—G. A. Huddart.
- Candles—2658—F. Meyer, W. Walwright, jun., and T. P. Pascoe.
- Candles—2732—A. Field.
- Caps—2584—M. Star.
- Carriage indicators—2597—J. Moanin, and C. Bose, C. A. Boissenot.
- Coal-mining machinery—2708—C. Jones.
- Cooking apparatus—2660—G. Underwood.
- Coughs, cure of—2783—J. and E. Blackman.
- Crochet needles—2576—J. Burgess.
- Dry substances, reducing—2799—H. Wedekind.
- Earthy matters, washing—2736—G. Wethered.
- Electric telegraph apparatus—2716—W. Clark.
- Excrement, deodorizing—2750—F. Taylor.
- Fabrics, finishing—2684—D. Gilson.
- Fabrics, sulphuring—2636—J. and J. G. Dale.
- Fibres, combing—2746—C. E. Brooman.
- Fibrous materials, cleaning—2626—R. E. Lasenby.
- Fibrous substances, combing—2644—J. Pollard, T. and J. Whitehead, and V. Williamson.
- Fibrous substances, preparing—2562—J. Ferrabee.
- Fibrous substances, separating—2564—F. W. Keselowsky.
- Fire arms, breech-loading—2652—A. Albin, and F. A. Braendlin.
- Floor cloths—2713—J. H. Kidd and J. C. Mather.
- Furnaces—2586—J. Robertson.
- Furnaces—2744—J. Watts.
- Furnaces, consuming smoke in—2738—W. Harrison.
- Gas, carburetting—2568—D. H. Saul and H. P. Armstrong.
- Hansom cabs—2670—W. H. P. Gore.
- Hats—2777—B. Tieski.
- Hats—2787—J. Gee.
- Hats—2789—J. E. Ward.
- Holting apparatus—2576—W. Clark.
- Jewellery—2654—G. E. Searle.
- Ladies' dresses, distending—2742—E. Mignot.
- Lamp glasses—2623—W. Clark.
- Lathes—2601—G. Dacre.
- Metallic brushes—2617—T. Welton.
- Metallic pipes—2734—R. Hollingdrake.
- Metal, rounding, &c.—2714—O. L. Hopson and H. Brooks.
- Metal rollers—2607—A. Fairbairn, T. S. Kennedy, and J. W. Naylor.
- Mining—2797—J. Hunter.
- Motive power—2609—M. P. W. Boulton.
- Nails, tacks, and pins—2660—J. Gilles.
- Needles, papering—2638—D. Evans.
- Oil cake, reducing—2748—H. S. Coleman and A. G. E. Morton.
- Organic iodides—2791—J. H. Johnson.
- Paper—2728—J. H. Johnson.
- Petroleum, storing—2700—C. E. Brooman.
- Pianofortes—2668—B. C. Newell.
- Pins, nails, or tacks—2706—C. E. Brooman.
- Piston-valves, packing for—2664—J. Coates.
- Ploughs—2764—B. J. R. Mills.
- Portable chambers—2722—T. Booth.
- Power looms—2710—E. B. Bigelow.

- Printing machines—2603—C. H. Gardner and J. Bickerton.
- Provision safes—2632—W. Watson.
- Railways, signalling apparatus for—2782—W. Denton, J. Whitaker, and E. Brooke.
- Reflectors—2674—A. V. Newton.
- Self-acting lubricators—2690—H. Keadler.
- Self-acting mules—2615—J. Dodd.
- Sewing machines—2630—A. V. Newton.
- Sewing machines—2785—M. and A. D. Hopkins.
- Ships of war—2692—C. Chapman.
- Ships, propelling—2724—J. H. Johnson.
- Silk, spinning—2640—E. T. Hughes.
- Spinning and doubling—2702—J. C. Brentnall and E. Edge.
- Steam boilers—2730—J. G. Tongue.
- Steam boilers—2606—W. E. Newton.
- Steam boilers, preventing explosions in—2634—I. M. Evans.
- Steam engines—2566—J. C. Chapman.
- Steam engines, oscillating—2674—S. Deacon.
- Steel—2668—W. G. Valentin and G. H. Benson.
- Steel and iron scrap, utilizing—2619—W. Clay and A. Bowater.
- Substances, separating—2696—N. Grew and G. H. Money.
- Surfaces, engraving on—2670—H. Garida.
- Synthes—2656—J. A. Coffey.
- Tape—2672—J. Smith and J. J. Rowe.
- Tube and bar cutters—2652—J. Wolstenholme and T. Pendlebury.
- Type-setting machines—2704—G. Davies.
- Vegetable fibres, preparing—2698—W. Simpson.
- Vessels of war—2676—R. Napier.
- Wax tapers—2730—J. J. Lane.
- Wearing apparel—2751—W. Calvert.
- Weaving, looms for—2638—D. Crichton, W. Donbavand, and D. Crichton.
- Weaving, looms for—2648—T. Sagar and T. Richmond.
- Weaving, looms for—2650—L. R. Bodmer.
- Weaving, looms for—2654—W. Roseler.
- Weaving, looms for—2682—B. L. Hattersley and J. Smith.
- Windows, fastening for—2662—J. H. Roberts.
- Yarns, finishing—2668—J. Blain.

INVENTIONS WITH COMPLETE SPECIFICATIONS FILED.

- Bedsteads—2674—J. P. Brown.
- Boot and shoe heels, revolving—2616—C. D. Norton.
- Calcareous stones, producing pictures on—2690—G. Haseltine.
- Harbours, &c., excavating—2631—H. A. Bonnevillie.
- Lace fabrics—2645—W. G. Swinnoek.
- Manure—2626—H. A. Bonnevillie.
- Pumping or ventilating apparatus—2627—H. A. Bonnevillie.
- Railway carriages, brakes for—2698—G. Haseltine.
- Sorters—2630—H. A. Bonnevillie.
- Submarine telegraphy—2632—G. Little.
- Ventilators—2616—J. T. Kershaw.

Journal of the Society of Arts.

FRIDAY, NOVEMBER 30, 1866.

Announcements by the Council.

ORDINARY MEETINGS.

Wednesday Evenings at Eight o'clock:—

DECEMBER 5.—“On the Trade in Foreign Cattle.” By JOHN IRWIN, Esq.

DECEMBER 12.—“On Old London: its Streets and Thoroughfares.” By J. G. CRACE, Esq.

DECEMBER 19.—“On the Study of Indian Architecture.” By JAMES FERGUSSON, Esq., F.R.S.

CANTOR LECTURES.

The first course of Cantor Lectures for the present session will be “On Pottery and Porcelain,” and will be delivered by William Chaffers, Esq. It will consist of six lectures, and will commence on Monday evening, the 21st January next, and be continued on succeeding Monday evenings.

The second course will be “On Music and Musical Instruments,” to be delivered by John Hullah, Esq. Arrangements for a third course are in progress.

The lectures will commence each evening at eight o'clock, and are open to members, each of which has the privilege of introducing one friend to each lecture.

MEDALS.

At the Opening Meeting of the Session, on Wednesday, the 21st instant, Sir Thomas Phillips, Q. C., F.G.S., Chairman of the Council, distributed the Medals awarded by the Council at the close of last Session, as follows:—To Mr. J. C. Morton, for his paper “On London Milk;” to Mr. Thomas Gray, for his paper “On Modern Legislation in regard to the Construction and Equipment of Steam Ships;” to Dr. J. L. W. Thudichum, for his paper “On the Diseases of Meat as affecting the Health of the People;” to the Hon. Charles Gavan Duffy, for his paper “On some Popular Errors concerning Australia;” and to Mr. J. Bosisto, for the Importation of the Essential Oil of the *Eucalyptus odorata*.

INSTITUTIONS.

The following Institution has been received into Union since the last announcement:—

Carlisle, Lord-street Working Men's Reading Room.

A new list of members of the Society has been printed, and any member can have a copy sent to him on application to the Secretary.

SUBSCRIPTIONS.

The Michaelmas subscriptions are due, and should be forwarded by cheque or Post-office order, crossed “Coutts and Co.,” and made payable to Mr. Samuel Thomas Davenport, Financial Officer.

Proceedings of the Society.

SECOND ORDINARY MEETING.

Wednesday, November 28th, 1866; Sir ROUNDELL PALMER, Q.C., M.P., in the chair.

The following candidates were proposed for election as members of the Society:—

Bruce, Rt. Hon. H. Austin, M.P., Duffryn, Aberdare.
Carter, H. H., Park-valley, Nottingham.
Clarke, William Henry, 5, Size-lane, E.C.
Clayton, General Sir William Robert, Bart, 79, Gloucester-place, Portman-square, W.
Ciffard, Hardinge Stanley, Q.C., Inner Temple, E.C.
Gilbee, W. A., 4, South-street, Finsbury, E.C.
Hooper, George, 246-248, Regent-street, W.
Humby, John, 48, Little Britain, E.C.
Manning, T. E., Eversfield-house, Bratton Clovelly, North Devon.
Rigg, Jonathan, Wrotham Hill-park, Sevenoaks.
Wood, John, Whitfield-house, Glossop.

AND AS HONORARY CORRESPONDING MEMBERS:—

Calcabale, Le Commandeur G. B., Consul de Monaco, Naples.
Manfredonia, Prof. Docteur Giuseppe, Naples.
Schrob, Le Docteur Alexandre, Strasbourg.
Tortorelli, Le Comte Hercule Malvasia, Naples.

The Paper read was—

ON LIMITED LIABILITY IN ITS RELATION TO MANUFACTURES AND COMMERCE.

By WILLIAM HAWES, Esq., F.G.S.

The subject I have selected for my paper this evening differs from those which usually occupy our attention, and some may think its discussion more properly belongs to a society whose object is the consideration of questions relating to the amendment of the law, and to the science of legislation, than to such a society as ours; but I hope to satisfy you that the introduction of limited liability partnerships into the general trade and commerce of this country is calculated to produce important changes in the relations of capital and labour, and of debtor and creditor—relations which, when sound, form the vital elements of our commercial prosperity; it consequently deserves careful consideration at our weekly meetings.

The time allowed for reading a paper on these occasions does not, when we have an eminently practical question to consider, permit us to devote any large portion of it to the history of the subject to be treated, so that I will, with a few words of introduction, endeavour to enlist your attention exclusively to the effect which has been, and most probably will be produced, by our recent legislation relating to limited liability partnerships.

Until within the last few years but two forms of partnership were in use in this country for commercial purposes. One, associations or companies consisting of numerous partners bound together for a common purpose, and trading under the protection of royal charters, or, more recently, under the provisions of special Acts of Parliament, each of which strictly limited the liability of the partners to the amount of their subscriptions; and

the other, the association of individuals as partners trading in their own or in joint names, with rules and regulations arranged among themselves for their guidance, but which did not release them, individually or collectively, from responsibility to the full extent of their fortunes for the debts incurred by partnership.

The grant of this individual immunity from liability for debts incurred by the first class of partnerships, was thought to be justified by the extensive character of the enterprises to be conducted at home, or from the principal seat of their operations being in our colonies or in foreign countries.

The most striking instances in times past of such chartered partnerships or corporations, were those of the New River Company, established in the reign of James the First, to provide the metropolis with pure water; the Bank of England, established in 1694, to conduct large monetary operations, the objects of both being the improvement and advancement of our social and trading interests at home; the East India Company, the Hudson's Bay Company, and the Hamburg Trading Company, established respectively in the years 1660, 1669, and 1406, to conduct and stimulate the trade, then in its infancy, with our dependencies, colonies, and foreign nations.

The principle of limited liability, as applied to trading companies, is not, therefore, new to this country.

The second class, or the association of two or more individuals, for a common purpose, and with unlimited liability, has, however, always formed the ordinary type of partnerships under which the great bulk of the business of the country has been conducted.

In such partnerships each partner was liable, to the full extent of his fortune, for the debts contracted by the company or firm of which he was a member, but the difficulty which frequently arose in determining who were the partners led to constant litigation. The necessities of trade often requiring more capital than the partners possessed, it was very often provided by friends as sleeping partners, who took no ostensible part whatever in the business, whose position, as sleeping partners lending capital, was unknown to the creditors of the firm, and therefore, could not have influenced the credit given by them. Still, on and after failure, upon the examination of the books by creditors, the advance of capital to, and the receipt of a share of profit by such sleeping-partners being ascertained, proceedings were so frequently taken, and with such contradictory results, in order to throw upon them the liability to pay the debts of those to whom they had lent their capital,—when the distinction between the receipt of interest at a fixed rate upon the capital lent and the receipt of interest fluctuating according to the profits had not been carefully maintained,—that at last an endeavour was made to obtain an authoritative decision as to the principle of law applicable to such cases, which led to the judgment given in the well-known case of *Waugh versus Carver*, by which it was held—though this judgement by subsequent decisions was much modified—that whoever shared in profits should also be responsible for losses, not for his share of the losses only but for the full amount incurred, or so far as his means would allow.

This decision for some years governed all questions arising upon the liability of partners, and ultimately led to the suggestion of new modes of lending and borrowing capital, by which to avoid the penalties so unjustly thrown on capitalists, and aided very much in the formation of that public opinion which first carried the Limited Liability Acts, and then the Partnerships Amendment Act of 1866.

I cannot here dwell upon or trace the steps by which these measures were gradually forced upon a somewhat unwilling Legislature, but the repeal of the usury laws, the increasing number of charters granted, and of Acts of Parliament passed, in both of which the limitation of liability was the main feature, and the increase of our foreign trade with countries where the principle of limited

liability was commonly applied to trading partnerships, all helped to remove a restriction upon the introduction of capital to trade, and an interference with the liberty of individuals to make such contracts for the conduct of their business as they deemed most advantageous, and led at length to the passing of the Acts of 1856, 1857, and 1862, and then to that of 1866, which, though in a very clumsy manner, have enabled men of business, whether associated in large or small numbers, to borrow capital, and to appropriate profits in any manner they may think most conducive to their prosperity.

I have said these Acts accomplished the object in view in a very clumsy manner. By the Act of 1862, the right of limiting the liability of partners to the amount of capital they advanced, and to that upon which alone credit was to be obtained, was restricted to partnerships consisting of seven or more persons. Fewer than seven partners could not enjoy the privileges secured by that Act, but by the Partnership Amendment Act of 1865 it is enacted that no one simply by virtue of his receiving a share of profits becomes a partner, or is thereby liable for partnership debts, thus, in fact, in an indirect and partial manner, introducing limited liability to private partnerships.

In associations of seven or more persons, under the Companies' Act, their names, and the capital advanced, must be registered in a public office, and credit may be obtained, as well upon the money subscribed as upon the known character and business habits of the partners so registered; but in smaller associations or private partnerships availing themselves of the provisions of the Act of 1865, and obtaining the aid of extra capital, for the use of which the partners are willing to pay a *pro rata* share of the profits, the names of the lenders must not appear as partners, nor must they take any public part in the management of the business, or it may be alleged that credit was given, relying on their known wealth and reputation, whereby they might be rendered unlimitedly liable for the debts of the firm in the event of its becoming insolvent.

But besides the clause to which I have been referring, this Act contains provisions applicable to all partnerships of very great value, for the remuneration of clerks, agents, and workmen, out of and according to the profits realised. The importance of this permissive power to masters as well as to men cannot be over-rated, and I shall refer to it again as I proceed.

The difference, then, between these partnerships and those formed under the Limited Liability Act of 1862, is that those formed under this Act are obliged to confine their operations to the objects described in, and to conduct their business according to the rules contained in, the registered articles of association, and generally to comply—when not inconsistent with their own registered articles—with the provisions of the Joint Stock Companies' Act; whilst ordinary or simple partnerships of one or more persons, availing themselves of the provisions of the Partnerships' Amendment Act, may obtain capital from any one, and give in consideration for its use a share of profits, without any restriction whatever on the mode of managing the business other than the care required to prevent the partners finding the capital being known to the public, or in any way pledging their credit as partners, or taking any ostensible part in the management of the business, thus approaching very nearly to the system "*en commandite*" in France; but they have the great advantage over partners in limited liability companies of being able to withdraw their capital if profits cease, thereby leaving the creditors of the business to their remedy against the ostensible partners only, whose credit and capital alone were pledged to them. This being the present state of the law, I will proceed to trace its probable effect on the future industry of the country.

Before doing so, however, I must call attention to the principles which used to govern the relations between

trader debtors, and creditors, and which many have thought, and which many, I believe, still think, have been most prejudicially interfered with by our recent legislation.

Long after Charters and Acts of Parliament, granting immunity to individuals from debts incurred by the governing body to whom the management of their affairs was entrusted became comparatively common in their application, the great principle of trade, that every one was responsible for the debts incurred by himself or by his agents, was as universally recognised and acted upon as it had been at any previous period; and this principle is, I believe, as universally acknowledged and acted upon now in all cases where the pledge of credit or a specific contract between parties can be proved, and the individual liability shown to exist, as it was before the sanction of Parliament was given to the Limited Liability Act of 1862; but so vast and so multitudinous are the commercial transactions of modern times, so great the ramifications of credit, and so essential is it to the prosperity of trade that the utmost freedom shall be given to the employment of capital, that it became absolutely necessary, in the interests of that trade and commerce we are all so anxious to encourage, that the responsibilities and privileges of partners in Joint Stock Companies and private partnerships should be placed beyond doubt. For this purpose the Act of 1862, applicable to all kinds of trading associations, was framed, and the pecuniary liabilities of seven or more persons associated in partnership for a common purpose were defined, and the exceptional state of legislation, which required the consent of the Government to a Charter or an Act of Parliament to each special act of incorporation for trading purposes, ceased to exist.

It was, however, impossible long to maintain a privilege to seven persons which was denied to individuals, or to small partnerships, and the Act of 1865, imperfect as it is, soon supplemented the Act of 1862, so that for all practical purposes, except as regards the ostensible manager or managers of a business, though not in a very scientific manner, limited liability was indirectly and partially introduced into private partnerships, and no one with ordinary care, lending money for trading purposes, need now be involved in unknown liabilities.

The effect of this legislation has been to bring capital into trade from classes which before never contributed anything towards the commercial enterprise of the country. All out of trade were before obliged to be content with investments mostly yielding low rates of interest, because any other might involve not only the loss of the money invested, for which they ought to be prepared, but also the risk of further and indefinite losses, for which they did not consider themselves morally or legally responsible, and which frequently involved them in entire ruin.

The Consolidating Act of 1862 did not alter the relation of any particular debtor to his creditor, or that of a member of a company who might pledge his own credit in its behalf, but it enabled every one to define publicly the amount he risked in any enterprise, and for which only at any time or under any circumstances he was responsible; and the rapid establishment of joint stock associations, for conducting all kinds of enterprises, since 1862, has proved how anxious the public was to employ its capital under these defined conditions, in trade and commerce, and also the vast amount of wealth which was still available (and perhaps owing to previous restrictions too easily available) for any purpose plausibly presented as likely to yield a high rate of interest. Another advantage afforded to the individual partners in joint stock trading companies is the freedom from all the penalties and inconveniences of bankruptcy in case of failure, and in this respect a very important alteration has been made in the relations between debtors and creditors. We may now have, as indeed we see every day, insolvent companies with all the

partners solvent, and we may have a solvent company with the partners insolvent. In the first case, whatever may be the amount of debt, no one is responsible, for the credit was given with a full knowledge that only the subscribed capital of the company was applicable to its liquidation, and in the other the shareholders have no power to withdraw their capital from the solvent company however insolvent they may be, except by selling their interest to other parties. We have by this course of legislation removed the onus of bankruptcy from all persons trading as partners in limited liability companies. The creditors of such companies know the conditions upon which they give credit, and have no right to complain if they give it imprudently, and as little right to require the maintenance of a cumbrous and expensive court of law to assist them in saving what may remain of their debtor's property when insolvency occurs.

If there be no bankrupts—and if this anomalous state of the law continues there will be but few, for all private partnerships will be converted into small limited companies—there can be no need of the Courts of Bankruptcy, which are now maintained apparently only in the interests of those receiving salaries under them. They are even now useless to the great bulk of trade and commerce, for almost every important estate is settled without their aid, and is indeed carefully kept out of the court so that the cost of winding up may be borne, and the mode of arrangement directed, by those who will suffer from bad administration, and have to pay the costs. Whether this freedom from the responsibilities attaching to debt when trading under the Act of 1862, has to this time, or will in times to come, produce a recklessness in the management of limited liability companies, time alone can prove; but this is certain, that no system of legislation can contain a greater amount of uncertainty in its administration, of extravagance in the application of the funds entrusted to it, more completely protect the dishonest trader, and more thoroughly promote commercial immorality, than is to be found in the administration of the law in our present courts of bankruptcy.

Previously to the enactment of the Limited Liability Acts of 1856-7 and 1862, the adoption of the principle of association and the advantages it secured to working men, when honestly conducted, was making rapid progress among them, but the legal difficulties arising out of the then state of the law of partnership, interposed so many obstacles to their safe management, that success was rather the exception than the rule. Indeed, to all classes the state of the law of partnership as administered before 1862 was restrictive, onerous, and injurious.

Since that time a new state of commercial enterprise has arisen, and it is the object of this paper to trace its course during the few years it has existed, and with great diffidence and caution to point out where it has been too inconsiderately introduced, and also to show what great results may be anticipated from it when experience has been obtained, and its use and its abuse shall be thoroughly understood.

As in the period preceding 1847, when the demand for capital by railway companies was so liberally responded to by the public, so since 1862 an almost unlimited demand for capital to be employed through the agency of limited liability companies in every branch of commerce and manufacturing industry has been met by a corresponding supply. New forms of employing capital have arisen—and the public appeared to think that because old concerns were converted into joint stock companies—because new manufacturing and trading companies sprang up in all directions, and because associations for forming such companies were established and appeared to meet with great success, that they would each bear an almost unlimited amount of preliminary expenditure never dreamed of in private trade before a shilling was earned, and would ultimately realise fabulous profits. The rapidity of formation

was so great that the difficulty, indeed the almost impossibility of finding competent officers, and competent directors to manage concerns, the mode of conducting, and the business of which, previously to their election, they had little or no practical acquaintance with, appeared to be entirely overlooked, and the race seemed to be rather how many old concerns could be converted into limited liability companies, and how many new ones could be formed in the shortest space of time, than how soundly and safely they could be established. Situations involving the management of millions were filled by persons never previously having had the entire responsibility of controlling thousands.

The result has been, as it was in former times, great disappointment and loss to individuals, but with, I believe, great benefit to the country. The loss has arisen mostly from the principle of limited liability not being fully understood, and from confusion existing in the minds of many between paid up and subscribed capital, so that as it was the interest of promoters to ask for as small a cash subscription as possible at first, and to represent that it would be sufficient for the purpose in view, little or no attention was directed to the unpaid portion of the subscribed capital, and to the certainty of calls being made upon it under almost any circumstances, but especially if adverse times arose. In fact, whilst the shareholders became members of a limited liability company, they subscribed for so many shares, representing such large sums, that their liability might as well have been unlimited as regarded their ability to meet the limited amount for which they became responsible. The principle which governs trading under limited liability was either overlooked or forgotten. The liability of a limited company is restricted to the amount of its registered capital, and this sum, which creditors know cannot be withdrawn or reduced except by losses in trade or fraud, necessarily limits the credit it ought to receive. The creditors, therefore, have no claim on any one, and have no one to blame but themselves, if they incur losses by giving credit to an amount which is not secured by their registered capital; but if shareholders, limiting their liability or credit to a fixed sum, advance only 20 per cent. of that sum, then the creditors become comparatively careless as to the amount of their debts, because, if the management be bad, and losses incurred, they know that capital to four times the amount of that advanced when their credit was given, is pledged for the payment of their debt. The imprudence of the debtor in undertaking such extensive liability relieves, and naturally so, the creditors from the exercise of their usual caution, for it seldom happens in ordinary partnerships that creditors know so accurately the amount of their debtors' capital as they do that embarked in a limited company. The burden of improvident and reckless trading falls, therefore, by their own voluntary acts, on the general body of shareholders. The managers—whose conduct has led to their ruin—often comparatively small shareholders, escape with little loss or inconvenience, and the creditors are paid in full; whilst those whose excessive confidence in the one, and whose promise to pay in full was fully traded upon by the other, bear the loss. Still, notwithstanding the losses, the misery and want of confidence which this state of things has temporarily produced, I believe, having great confidence in the advantages to be derived from the prudent application of the principle of co-operation, that the practical experience gained so rapidly, and the improved knowledge of the limits within which joint stock enterprise can be profitably employed, will so direct the future investments of capital in like undertakings, as ultimately to realise to individuals and to the country the full advantage of co-operation in all the great industries of the country. But there is no part of the recent improvement in the law of partnership which will, I believe, in time, confer such benefits upon the country, and particularly on the work-

ing classes, as that, which in addition to the opportunity workmen now have of buying shares in the limited liability Companies in which they are employed, enables masters to appropriate some portion of their annual profits to workmen, either in lieu of or in addition to wages, without any of the complications of partnership, or the necessity of converting private partnerships into public companies.

The advantages, then, of association and co-operation are now open to all classes. The more wealthy can unite to conduct large monetary and commercial undertakings, the shares in which may be of a high denomination; the middle classes, including the members of all professions, can unite in manufacturing and trading industries to their mutual benefit, and that large class of producers who depend on weekly wages may combine to obtain at the cheapest rate and of the best quality a supply of the necessities of life, and a fair and legitimate mode of influencing the rate of wages never before open to them. But whatever may be the pecuniary advantages derived by individuals from association under limited liability, those to be derived by workmen, and through them by the State, either by their becoming shareholders in the large establishments where they are employed, or by their receiving by special agreement a certain portion of the net profit, after the payment of proper interest on the capital and salaries to the partners, are of far greater moment.

If one workman only among the thousands employed in many large works becomes a shareholder, he will, half-yearly, receive a copy of the balance-sheet, and learn on authority the net profit realised by the joint application of the capital and labour engaged in producing the return stated in the official document then in his possession.

If that profit be very large, no one could feel surprised at the workmen asking for some, however small, participation in it, and I do not think any board of directors could safely, having in view the future prosperity of their works, resist an appeal, if properly urged by the men, for so fair and equitable an appropriation of a portion of the profits. For the same reason that I think such an appeal to a board of directors could not be resisted, I believe it will be found to be the interest of every large employer of labour, from the banker or merchant to the manufacturer and miner, to declare to those in his employment his intention to appropriate annually a fixed proportion of his profits, after the payment of interest on capital, for division among all who have contributed, by their minds or hands, to the realization of that profit; the sum applicable to each to be dependent upon the position held by him and upon the influence his exertions have had in producing the general prosperity of the works.

There are now a sufficient number of instances in which this principle is in partial operation, and where the results are known, so that the advantages derived by the adoption of this system, from the increased diligence, care, and energy displayed by all parties interested, are admitted, and it is believed that they amply repay, directly or indirectly, the extra charge thereby apparently thrown upon the business.

I have not time to quote instances which have come under my own observation, but they comprise a large professional business (legal), and manufacturing and mining establishments.

In fact, this mode of remuneration will strike at the root of the evils of trades' unions—that is, so far as they are directed to restrictions on labour. If every man, in addition to his wages, is a partner in the profits of the works in which he is employed, and is made to feel how much profits are decreased by any undue interference with the freedom of labour, and that his half-yearly bonus is lessened by such interference, he will soon become, if not an opponent of restrictive trade regulations, a very lukewarm supporter of them, and an

unwilling subscriber to the funds of associations which directly reduce his receipts with very small prospective, if any, advantage.

It is only by showing to working men how their material interests can be improved by other and better associations that we can expect to influence their conduct in respect of trades unions. Their object is to obtain higher wages; let them be satisfied that these can be secured by working for one common purpose with the master, and I do not believe they will be so easily as at present led away by the leaders of trade societies, who have generally other ends to serve besides the prosperity of those they represent. Whatever advantages may be obtained by union are only realised through great sacrifices of money, time, and labour, much distress, and frequent disappointment, and I think it will not be difficult to show them that they will gain as much and avoid this discomfort and loss, now they can be admitted to share in the prosperity of the work in which both are engaged, if by kindly arrangement with their employers they avail themselves of the wise provisions of the Acts of 1862 and 1865, and thus form a trades union for the beneficial purpose of promoting the welfare and profit of both masters and men.

If, then, proper means be now taken by all employers of labour to enlist the good will and energy of their men by giving to each workman a personal interest in the profits resulting from his labour, the existing antagonism between labour and capital will be gradually weakened, till, in a period not very distant, we may hope to find all classes of producers of wealth united in a joint endeavour to obtain by most healthy co-operation the best results for their mutual benefit.

For myself, I cannot express surprise that the antagonism, now so often complained of, should exist between labour and capital. The men feel day by day how little their physical position has been improved since their fathers' time, and must be sanguine indeed if they can see much prospect of their children being in a materially improved position to their own. Their work is as severe—their houses are but little if at all improved—their food is no better—and the education given to them as children, hardly ever of so practical a character as to be useful in after life, they have little, if any time, to improve. I am of course speaking from a workman's point of view, for admitting, as I am glad to do, that during the past twenty years improvement has in many respects taken place in their social condition, yet looking at it as a whole, I fear it has been so gradual, and from bad to only a little better, that they do not, indeed cannot realise it. Can it then surprise us that they should look with some jealousy at the enormous fortunes accumulated all around them, often within their own lifetime, and at the princely state in which their employers live? It appears to me to behave all whose success is dependent upon the labour of others, and especially those who employ large numbers of workmen, to think seriously of the great advantages they may derive from the improved spirit which would animate the whole of their establishments, and the great benefit which they may confer on their men by placing them, as they now can do by availing themselves of the provisions of the Act of 1865, in the position of partners in the products of their labour, and as parties interested in the most economical and efficient management of the business. The saving to be effected by each of the 1,000 men employed in a large factory—in time, in material, and in general economy—if he felt he was working for his own benefit, would produce a fund that would, I believe, surprise both masters and men.

But it may be asked whether the workmen who receive a portion of the profits by an amicable arrangement with their employers will have any right to interfere with the management of the business. To which I reply certainly not. They will not be partners

in the business, though they take a share in the profits—a fixed and definite share, which will vary with the profits, but in respect of which they will not bear any losses when they occur, nor have any rights as partners. Their share will only be payable after the fixed charges for interest on capital and management, and all losses are provided for, and the liability to loss from causes incidental to all trades, or arising from commercial changes which no one can guard against, will of course determine the proportion of the gross profit to be appropriated to the principals.

Until recently it would have been objected to this proposition, that masters would not like to expose their profits to their workmen or to the public; but the rapid conversion of private firms into joint-stock companies, which are obliged to publish their profits and account for losses, quite removes this objection.

But whether in joint-stock companies or in private partnerships, no arrangement of this kind could be advantageously adopted unless with the cordial co-operation of masters and men. The entire establishment must be animated with a desire to promote its prosperity, and the object of all must be to prevent those unseemly and most injurious differences between masters and men which ultimately end in strikes.

Indeed, I can hardly conceive there can be two opinions that, if wages are to be raised—which, in other words, means that the men are to have a larger share of the profits derived from their industry—it is better they should have this increase when profits are good, and under an agreement voluntarily made between them and their employers, than when angry feelings are excited by a strike or a threatened strike. Strikes generally originate when trade is either very good or becoming bad—in the one case to obtain higher wages, in the other to prevent a reduction. In either case the system of regularly appropriating a portion of profits must be beneficial to the men. In the first they would watch carefully an improving demand—rejoice in it, and feel an interest in their work, and growing contentment would take the place of jealousy and discontent; whilst in the other they would be sensible of a decreasing demand, and know full well that profit would fall in proportion, and that their share must necessarily decrease.

It is then in this direction that in the course of time I look for the greatest results from the operation of the Acts of 1862 and 1865. But I must now refer to the effect which the gradually-increasing application of the principle of limited liability to industrial undertakings, through the action of joint stock companies, will probably have upon capital, and therefore on the production and cost of our staple manufactures.

The law of limited liability did not, *per se*, increase the capital of the country; but by the removal of restrictions on the free employment of capital in trade, it attracted to business a vast number of small sums, forming a large total in the aggregate, and thus practically increased the amount of money seeking employment in trade which had been previously excluded from it. It was not, therefore, by new capital, but by a change in the investment of capital, that the new joint stock companies have been supported.

The certain result of suddenly withdrawing capital from one investment, and placing it as suddenly in another, is unduly to depress the one and to inflate the other, and this state of things will continue until, in the course of time, the normal relative position of the two industries or investments shall be restored. But if joint stock companies are as successful as under good management they ought to be, the high rate of interest they will return to the shareholders must increase the value of money to be employed on mortgages and other non-trading securities, and in all probability a higher than the present ordinary rate of interest will, for a time, be obtained on all such investments, if it does not produce

a wider and more lasting effect, and raise the general rate of interest in the country.

I have now occupied the time allotted to me, and will only add by way of general summary that whilst admitting the losses, bad management, and disappointment which have attended a large number of the joint stock enterprises which have been established since the passing of the Act of 1862, I cannot see in them anything to shake our faith in the soundness of the principle of limited liability. If in all the cases of failure now so patent, not only the principle but the practical operation of limited liability had been strictly adhered to, and the amount of capital actually paid up had been the sum to which liability attached, but few of the calamities of the present time would have occurred; it was because the principle on which such companies should have been formed was not understood, or if understood was not acted upon, that misfortune has followed so rapidly on their formation.

The loss arising from the stoppage of any business—the loss of goodwill—the loss by peremptory sale of stock—and the expenses of winding-up, whether voluntarily, in bankruptcy, or in the Court of Chancery, are enormous, where there is a fund to work upon—but all these would be reduced to a minimum if no calls could be made, and no funds found to provide for legal contentions.

There is one case on record of a limited company with a capital and loans of £500,000, raised in £1 shares, which in the course of a few months lost the entire capital, and incurred, in addition, £60,000 of debt, on open current accounts. Had not the call been paid in full, the litigation in winding-up that company would not have been closed to this day; but as there were really no assets, nor any fund from which to pay costs, the company ceased to exist, no odium or responsibility appearing to attach to those whose bad management terminated so disastrously, and the circumstances are all but forgotten.

The object to be kept in view by all who join limited liability companies is to see that their liability is limited either to the cash advanced, or to such further payments or calls as they can conveniently make if called for in a short period of time. Adherence to this rule will obtain for industry the full advantages of the co-operation of numerous partners, and to the partners the freedom from unknown risks which it was the intention of the framers of the Act of 1862 to secure to them.

But there is still another point from which to view the effect which the impetus these Acts will give to the formation of co-operative societies, and the association, for one common purpose, of masters and men, and that is its political aspect.

At a time when all appear to admit that more political influence must be given to the industrious classes, and when the beneficial operation of any such measure, either nationally or socially, must depend upon their acquaintance with the economical principles upon which their own prosperity, as well as that of their country, rests, it must be of the utmost importance that they should thoroughly understand the beneficial character of the legislation in their behalf during the past few years, and that they should be thoroughly instructed as to the best mode of applying it to their own advantage.

But before the full effect of this legislation can be productive of much practical good, masters and directors of joint-stock companies, especially those conducting large industrial operations, must feel it to be their paramount duty to place the subject before their men in a plain and popular form, and must make such arrangements for the appropriation of the portion of profits assigned to them as will satisfy them of the *bona-fide* character of the arrangement, and that its realisation may be fully relied upon. There must be candour and confidence exhibited towards the men, who will seldom fail to return it.

Confidence being thus established—the progress of legislation upon trade, the importance of every regula-

tion or treaty affecting each department of industry, and by which restrictions upon labour are removed, or the free interchange of commodities between foreign countries promoted—will be watched with intelligent vigilance, based on direct self-interest, and it does not appear to me too much to expect under such circumstances, that our recent legislation, if acted upon in a right and earnest spirit, will convert combinations of workmen, now actuated by feelings and motives independent of, and often hostile, to their employers, into combinations to stimulate, by all legitimate means, the prosperity of each branch of our national industries.

If, then, by affording facilities for the establishment of co-partnerships in industry, or for the appropriation of a certain per-centage of profits of ordinary partnerships under the Act of 1866, to all engaged in producing manufactured articles, whether it be the reproduction of cheap works of art, or the manufacture of the necessaries of life, or the importation of raw materials from foreign countries, greater results can be obtained than by adhering to the old plan of allowing all classes of producers to work each in their own circle and striving for their own personal ends only, that system of legislation which has inaugurated such a change in the relations of capital and labour will rank foremost among those to which this country will be indebted for the future prosperity of its Arts, Manufactures, and Commerce.

DISCUSSION.

Mr. J. GERSTENBERG said it seemed to him that the question for consideration was not so much whether the principle of limited liability should or should not meet with their approval, as whether co-operation and joint-stock action would prove favourable to the development of the trade of a commercial community. The author of the paper had come to the latter conclusion, he (Mr. Gerstenberg) thought, on insufficient premises, and had attributed failure to the want of appreciation of the true principles of limited liability, but he had omitted to inform them what he considered those principles to be. He (Mr. Gerstenberg) believed co-operation was very useful in every instance where private enterprise could not be brought to bear. Such things as railways, canals, &c., were beyond the reach of private individuals, but in his opinion it was a mistake to form companies to carry on businesses which could be better managed by the labour and energy of one individual than under the complicated system of a company; and he believed that principle would soon be established to such an extent that no persons would be found to take shares in companies of this character. Mr. Hawes had brought before them one of the "dissolving views" of recent times, in which a capital of £500,000 appears to have been entirely dissipated in a short period, but this might be regarded as one of the eccentricities of the present age. With regard, however, to the principle of limited liability, it had long been recognised in other countries than England; but in this country, from some unexplained reason, it had been formerly thought a necessary principle of partnership that a person who held a single share in a joint-stock concern should be liable to the last farthing of his means in respect of that share. This was a monstrous system, and he would never become a shareholder in an unlimited company upon principle. With respect to the mode in which the limited liability principle should be applied, he thought we might take a lesson from our continental neighbours. Among them, if a house of business, or private concern, wished to increase its trading capital, the principals could take in partners, with limited liability, and thus form themselves into a *société en commandite*, in which the acting partners are liable to the full extent of their means and the others to the amount only of their shares. When, however, limited partnerships were adopted in this country, this distinction

between the two classes of partners was not preserved. A large sum was usually in the first instance asked for the good-will of the concern; then the acting partners became liable only to the amount of shares they held. An act was passed in 1805 to introduce the system of permitting parties to advance capital to trading firms without making them liable beyond the amount so advanced. This, however, had been but little acted upon. One influence that had operated most unfavourably upon limited liability companies in this country had been the jobbing on the Stock Exchange. Confidence or no confidence in the concern was regulated by the quotations on 'Change, and not from actual investigation of the affairs of the company. He might say that his own experience in these matters had been dearly bought; and while he expressed his thanks to the gentleman who had so ably brought this matter before them, he could not entirely agree in the sanguine views he had put forward in reference to the future. This country had, indeed, paid dearly for its experience, as far as it had gone, of limited liability, and he agreed with Mr. Hawes that, in the great majority of cases, failure had resulted from incompetent persons having been placed in the position of managers. The discussion of such topics in a society like this could not but be beneficial, and he had no doubt the ventilation of this question would lead to good results.

Mr. S. SIMON said, having acted as secretary to two limited liability companies, both promoted by persons of the highest respectability, one having been a total failure, and the other eminently successful, he might be permitted to offer a few remarks on this very practical subject. They must all agree with the last speaker that limited liability ought only to be a vehicle for raising money for private undertakings, when private individuals were unable to raise it themselves. But during the last year or two limited liability seemed to have run wild; the consequence was, not only had a great many foolish things been brought before the public on the shoulders of limited liability, but many things which would have worked well under the moderate expenses of private management had come to the ground when burdened with the expenses of directors, secretaries, lawyers, &c., which commonly appertain to a public company. The question to be considered was—what were the cases in which they could or could not properly apply the system of limited liability? It was quite evident that there were an immense number of businesses the success of which depended mainly on the individual ability of the persons who managed them. When they had good men as managers the business succeeded, but if they were replaced by incompetent persons, that which had previously been carried on with a good profit was reduced to a positive loss. He had known private businesses which had been profitably carried on through generations of a family, and which had been thought good opportunities for being formed into limited liability companies; there were businesses in which it appeared that additional capital might be employed with advantage, but at the same time the nature of the business might be such as to require the constant daily attention of a person who entirely understood it. He knew of one instance in which it was thought the parties had made a good bargain when they gave a gentleman a salary as manager equal to half the total profits which the original partners realised. Besides this, a large sum was expended in the improvement of their premises, and then the concern was opened on a new scale. But it soon failed, the gentleman appointed as manager proved more ornamental than useful, and it turned out that his wife had been the real manager, and she declined to give the shareholders the benefit of her assistance unless she was paid a salary too. Taking the salaries of the husband and wife, remuneration to directors, and legal expenses, it was found that those sums entirely swallowed up the profits realised. The result was that up to the present time that

company had paid no dividend to the shareholders, and at some future time they would probably hear that the concern had reverted to the original proprietors, and had again become a profitable business. Instances of this kind might be multiplied to a great extent. Another company, formed thirteen years ago, before limited liability came into operation, but which had since been brought under it, was fortunate enough to secure as promoter and manager a gentleman of great practical ability. The result had been that during the whole period of its existence the company had scarcely omitted paying a regular dividend of 20 per cent. If a man less capable had been at the head of that business the probability was it would have been carried on at a loss. The public of this country having lately passed through a crisis so severe, it was to be hoped that they had gained some little experience by which they would profit for the future. With regard to the other point discussed in the paper, while admitting that the working classes could do great things in the way of co-operation, he did not think that any very great results could be anticipated from giving them a per-centage of the surplus profits of the concern in which they were employed. The real fact was that a considerable rise had taken place, from various causes, in wages, and he thought the artisan would not be content to forego the certain advantage of that increase of pay for the chance of receiving a bonus of £2 or £3, at the end of the year, as his share of the surplus profits of the business. He was rather surprised to hear, from so high an authority as the author of the paper, remarks to the effect that the position of the working man had not materially improved. Although he confessed that position was far from satisfactory, it was an immense improvement upon what it had been some years since, and he looked more to what the working classes could do for themselves than to what could be done for them to promote further progress. He was not yet an old man, but within his own recollection a very remarkable change had taken place in the position of the working man. Formerly he was content to wear second-hand clothing: now this was not the case. At the present time there was no doubt discontent among working men, which arose partly from the fact that their education had improved, and they had become a reading and a thinking class, and noticed inequalities which they did not notice before. Legislation, however, by removing taxes on various necessities, had done much for them, and their position was no doubt most materially improved.

Dr. PANKHURST remarked that Mr. Hawes had introduced this subject with an apology, for which there was no necessity, for the progress of manufactures and commerce depended essentially upon the conditions and restrictions which regulated the association of capital, experience, and industry; and if the subject was intrinsically fit for discussion before this Society, certainly the time was most opportune. Whilst they were in the midst of the crash of enterprises, then was the most fitting time to make an appeal to principles. By the operation of two legislative enactments—the Companies' Code of 1862, and the Partnership Amendment Act of 1865—the entire community had placed before it the opportunity of lending money for commercial purposes with a liability which was precise and determined. Now, on the occasion of the presentation of that opportunity, there arose two questions of great moment. First, what effect would this opportunity have, on the one hand, on the lender of the money, and on the other, upon those who trusted the company into which the money was to go? To take the first point, if a man lent his money in an enterprise with the details of which he was not conversant, or in the operations of which he had not the opportunity of taking an active part, to say that his liability should be indefinite was practically to impose a barrier to the money being lent at all. Indefiniteness of liability was paralysis

to confidence in the lending of money. But what guarantee had the lender for the safety of his investment? He had, under the code of 1862, three substantial guarantees. He was certified by a publicly registered document of three leading facts, viz., the object of the company, the capital of the company, and the general procedure by which it was to be governed. But if he were a wise and prudent man he would seek two other guarantees—he would satisfy himself that the thing was likely to succeed, and also that it was in the hands of people who would work it well. If those two common-sense conditions had been applied, nine-tenths of the companies would either not have been started at all, or would have succeeded. But there was another aspect of intense moral significance. They heard of limited liability companies with unlimited power of obtaining credit, combined with an easy way of escaping payment. Was that in conformity with the facts of the case? What were the conditions under which a creditor dealt with a company? He had the three guarantees which the lender of the money had. If, in the face of those facts, he incautiously sent in his goods to the company, was the principle of limited liability responsible for the mistakes that were thus committed? He thought not, and it was not fair to charge those consequences upon the principle of limited liability. With reference to the provisions of the Partnership Amendment Act of 1865, the first speaker appeared to consider that they were not so satisfactory as those existing abroad, in the undertakings known as *sociétés en commandite*. In France, if a partnership of five persons openly, in the eyes of the commercial world, conducted a business, those five men were partners in the full sense of the word, and were liable for every penny they possessed; but supposing they associated with them three other men, who did nothing but lend money and receive profits, in that event there were publicly certified five facts: first the names of the five acting members of the firm; secondly, the nature of the business; thirdly, who of the five were the actual managers of the business; fourthly, the amount of capital lent to them by the other persons referred to; and fifthly, how long the partnership was to exist. That constituted a *société en commandite*. In England they had the same thing, except that they did not register the five names as above. He would not now enter upon the question as to the desirability of such a registration. That was a subject which had been discussed for years, and a parliamentary vote upon it was taken in 1865, and on consideration it was decided not to register; but it was of importance to observe that the ostensible manager of a concern should still be responsible to the full extent of his means, and that was the law now. There need be no doubt that out of the principle of limited liability must ultimately grow an immense social benefit. Those who had money to invest would know what amount of liability they contracted when they lent it in the commercial world; and when creditors exercised the virtue of caution they themselves would be safe. Under these circumstances there would soon not be a farthing of capital in the country the owners of which would not be morally bound to come forward and assist some commercial enterprise, and thus arose an opportunity of connecting what had hitherto been too much regarded as hostile interests—capital and labour.

Mr. Moxon considered that up to the present time the law with respect to partnership liability had been a signal failure, as was testified by some 3,000 cases of companies in the winding-up court, involving a very large amount of capital which had been lent by the public either from confidence in the names of the directors, or in the enterprise itself, and who had lost the whole or a great part of their money. Whenever there was a plethora of money in the country, which appeared to occur about every ten years, people became dissatisfied with three per cent. when consols were at 100, and they looked about to see if they could not make 5 or 6 per cent. in other

investments. Looking at the various schemes brought forward, the directors were in many cases only appointed to act as such for a certain time, and the articles of association were drawn up after the shares were subscribed for, and they knew from experience that those articles were scarcely ever looked at till some disaster was apprehended, or had actually arisen. One might have supposed that by the frequency of these commercial disasters the public would have become disgusted; but there was something so tempting in prospectuses promising 15 to 20 and 30 per cent., that the public could not resist them, and the smaller a man's capital was the more eager was he to make a large per-centage out of it. It was a well-known fact that clergymen of all denominations were generally the greatest sufferers in all joint-stock disasters. With regard to the mode of conducting the business of some companies, Mr. Moxon mentioned an instance in which, for a given purpose, the holdings of a few large shareholders were split up and disposed of to other persons so as to obtain a majority at a meeting at which a special point was to be carried. Mr. Moxon animadverted in severe terms upon the system which now so extensively prevails of taking directorships as a matter of business, by which he said large incomes were made from the fees paid to directors, and a larger amount by speculating upon the knowledge which their position gave them. When they saw the great number of companies that had lately collapsed, he was astonished that the public should be allured by the fresh baits that were held out to them. He believed that under limited liability, with restrictions which would bring character and honesty to bear in the conduct of these large concerns, joint-stock enterprise, ably and faithfully managed, would rank amongst the most prosperous investments that were to be met with in the present day.

Mr. EDWIN FIELD expressed the deep interest which he felt in the subject, and regretted that the two really great questions treated by Mr. Hawes should have been included in one paper, as he considered each was worthy of separate consideration—the co-operative system being perhaps the most important. With reference to joint-stock companies, there was one system which, as far as he was aware, had never been yet carried out in this country, viz., companies under guarantee, working out the *commandite* principle. He believed the reason why so many companies had failed was because the principal object of the promoters was to get the shares on the Stock Exchange list, the real object being lost sight of in the desire for speculation in the shares. He did not agree with the last speaker as to the number of companies that had been brought under the operation of the winding-up Act; he thought 200 was nearer the mark than 3,000. To judge of the advantages of limited liability he thought they should look to the living companies rather than to the defunct ones, the great majority of the latter having been started by persons who never intended to remain in them after their purpose was served. The fact of its being a matter of anxiety in the promotion of a company to get it upon the Stock Exchange list, might be regarded as a distinctive mark of its being merely got up for sale. His own personal inspection of such concerns had been that of a surgeon who made a *post-mortem* examination for the purpose of finding out the nature of the disease that had killed them, rather than that of the gentleman (Mr. Sidney) who had acted as secretary during their vitality. His own experience was that the success or non-success of an enterprise mainly depended upon the character and business qualifications of the person by whom it was managed. The other question treated of in the paper, as affecting the employés in large business concerns, was one in which he had long taken the deepest interest; and it was a great satisfaction to him to be able to state that in the firm with which he was connected in the legal profession, the system of allowing the clerks in the office to participate in the residuary profits of the business, had

been adopted for several years with the most gratifying results to all parties. It not only made them more energetic in earning the profits, but also in detecting fraud and speculation on the part of members of their own body, by which these profits might be diminished. It also promoted what he was sure they would all cordially appreciate—the most friendly and confidential relations between the employers and those under them; he was happy to say that thinking men in his own profession were adopting this system, and he saw no reason why it should not obtain amongst all the ramifications of labour. He thanked Mr. Hawes for bringing the subject forward, and he was delighted to find the extent to which the system was adopted in many of the great commercial undertakings of the country.

Mr. E. DIBLEY disagreed with the opinion expressed by the first speaker, that no sensible person would eventually take shares in limited companies, except in those undertakings which could not be carried out by a few individuals, such as railways, &c.; for all that had been stated with regard to the failure of the limited liability system on a comparatively small scale equally applied to concerns of a gigantic description. It was mentioned by one speaker that people were especially attracted by the promises of large profits put forward by the promoters of bubble companies. No doubt this was the case, but this had no essential connection with the principle of limited liability, and, for his own part, he thought that the problem of the true relations of labour and capital was to be solved by the limited liability principle. They knew from experience that the application of new ideas often created a great amount of corruption at the beginning; for there were always persons ready to take advantage of a new system for the sake of their personal interests and at the expense of others. What they wanted was limited companies based upon good principles, with good men to manage them, and, looking to the vicissitudes of life, it would be an advantage in such concerns to have persons growing up under the wing of the managers, so as to be ready to take their place, in the event of their retirement, from death or otherwise. To turn to the question treated of in the latter part of Mr. Hawes's paper, he thought that opportunities would thus be afforded by which working men might be drawn into closer sympathy with their employers, and the relations of labour and capital be thus harmonised. This was, indeed, a wise application of the principle of limited liability. Being himself connected with a large manufacturing concern he knew how much the profits of the business depended both upon the quality and the quantity of work that was done, and the honesty with which it was done, and if the men could be brought to a participation in the profits of the concern he was sure it would conduce to the interests of all parties, and put an end to that antagonism between masters and men which unfortunately now too generally existed. He would mention that a friend of his had suggested what he thought an excellent plan for carrying out this co-operative system. Supposing an *employee* was paid £100 a year, and the profits of the concern amounted to a certain sum, the employer could hypothecate to this man a certain number of shares, and if the business paid a per-centage above a certain fixed amount, he would be entitled to a bonus proportionate to the number of shares so hypothecated to him. Notwithstanding the vast manufacturing resources of this country, they saw every year large sums of money going out in foreign loans, for which in many instances a very poor return was made. Was it not better to employ that money in developing the manufactures of our own country, and by that means increasing the wealth of all classes of the community?

Captain J. SELWYN, R.N., said that notwithstanding the dismal picture which some of the speakers had placed before them as to the working of limited liability in this country, he thought we ought not to forget how much had

been done by companies established under Acts of Parliament, such as railway companies and others, for promoting the commercial prosperity of the country, and he thought this principle wisely applied would still do much for the progress of the world at large. Small partnerships would not meet the demands of modern enterprise. As well we might suppose that the metropolis could be supplied with water from the old stand pumps, and its streets lighted with the old oil lamps, as that the old partnerships of three or four individuals could meet requirements such as those of the Atlantic Telegraph, or a great line of steam communication. He thought the per-centage of successful companies had been too much lost sight of. Those which did succeed were not generally much talked about, whilst those which did not were forced into an unpleasant notoriety. It was too much the habit in these matters to find fault with the laws and the Government. The idea of appealing to the law was one which we derived from our belief that the law was a remedy for everything; but those who tried it generally found it was successful in involving them in great expense, but not so successful in giving persons what they thought was justice. It was true directors of companies were chosen in many cases not from their personal merits or acquaintance with the business to be embarked in, but the East-end sought for lords, and the West-end for men of money, and both classes consented to belong to Boards on which they seldom if ever sat, and no doubt companies had suffered much from such a state of things. With regard to the idea of the participation by workmen in the surplus profits of a concern, there were two ways in which that could be accomplished; first, by the workman, who ought to have a good idea of the merits of the concern, buying the shares in the market; and, secondly, by merely having assured to him a certain share in the surplus profits in such proportion as might be agreed upon with his employers. No doubt this might have an effect in some cases, but he (Capt. Selwyn) thought that, in most instances, unless a workman could be taught to do his duty in the station in which he was placed, in an honest and God-fearing manner, upon moral principles, no amount of participation in profits would induce him to do so. To return to the question of the failures of limited companies, he believed that many of the largest failures they had lamented over during the last six months were distinctly traceable to the jealousies of financial kings, who saw their empire about to be invaded and themselves forced to compete in the financial market, as other people were obliged to do in the commercial market. There was, however, a plan to which he wished to draw attention, that of protection, by means of insurance, from loss under limited liability. It was not impossible to insure a house even when a specially hazardous business was carried on in it, and in like manner he thought the same system might be applied to losses by public companies. It was impossible to get shareholders to inspect books before they entered into a company, but they invested in it because they were told wonderful profits would be made, and that was how many people were ruined; but by a system of insurance they might provide against risks other than those to which the general run of business was liable (for against the latter no one could provide), and thus they might obtain a guarantee against bubble companies, and shares would not be run down by interested "bears," nor run up by interested "bulls." The rule of limited companies he believed had been success, and failure the exception, and with the elimination of some evils still existing in the system, he thought the ultimate progress of joint-stock enterprise in this country was certain.

Mr. FROST, jun., regarded limited liability as one of the greatest successes of the age. A great point in the present day was to get an improved class of directors, so as to check undue speculation in the shares; moreover, it was to be remarked that while the amount of the shares was limited there was no limit put to the number of shares

allotted to one individual, who might thus render himself liable to ten times the amount he would ever pay. Individual energy and practical ability were the qualifications for managers; and the great fear in these matters was that duties might be relegated to incompetent and sometimes adversely interested managers.

The CHAIRMAN said he was sure the meeting would all agree in tendering their best thanks to Mr. Hawes for the very able paper he had read.

The vote of thanks was then passed.

Proceedings of Institutions.

EAST LANCASHIRE UNION OF INSTITUTIONS.—The fifth report of the Union has just been issued, and relates to the operations of the Society for the past three years. It also contains a paper "On the East Lancashire Union in its bearing on the Question of the Education of the Manual-Labour Classes," read at the late meeting of the Social Science Congress in Manchester, by Mr. Ughbred Kay-Shuttleworth. The report states that since 1864 the Council have had the misfortune to lose the very valuable services of their two organising masters; and also, owing to the distress through the cotton famine and the consequent embarrassment of the Institution (from which they have not yet recovered), they have been obliged to reduce their staff, and now employ only one organising master. The number of candidates who have attended the annual examinations, which are held in Burnley, the central town of the Union, during the month of June, have somewhat decreased since 1864, but the results show a much less percentage of failures. In 1864 the number of candidates was 158, of whom 66·5 per cent. passed. In 1865, out of 85 candidates 90·4 per cent. passed. And in 1866, out of 87 candidates, 98·8 per cent. passed. The subjects of examination, as shown by the printed results, were: First class, males:—Analysis and parsing and an essay; and also any four of the following subjects:—1. Scripture History. 2. Chemistry. 3. Mechanics. 4. Euclid. 5. Algebra. 6. English History. 7. Paley's Natural Theology. 8. The Steam-engine. First class, females:—Analysis and Parsing, Paraphrasing, to write an essay; Arithmetic, Domestic Management and Cooking, and Geography. In the other classes a lower standard of subjects was demanded, but all were required to pass in the English Language subjects. One new feature connected with the Union is the extension of the Examinations to evening schools attached to day schools, by means of a subsidiary examination, held in the beginning of April. At the first examination of this kind, held last April, 36 candidates presented themselves, and 86·1 per cent. passed in the two lowest sections in which the Council examines. The Council express a hope that this extension of their efforts may be widely adopted in the district. As regards other examinations at which the pupils connected with the Union have competed, they have been highly satisfactory. At the Examinations of the Department of Science and Art, in 1865, the pupils gained one gold medal and sixty-three Queen's prizes, of the total value of about twelve guineas. In 1866 they gained fifty-one Queen's prizes, of the value of about £10 4s. In connection with the Society of Arts Examinations during the past two years, prizes to the total value of £42 10s. have been awarded, and amongst these the late Prince Consort's prize for 1865. The certificates gained were also sixty-three in 1865, and sixty-one in 1866. In the examinations of the Lancashire and Cheshire Union, in 1865, the pupils gained five money prizes, of the value of £9, and thirty-five certificates; and in 1866 they gained five money prizes, of the value of £12 13s. 4d., and forty-three certificates. Through the organisation of the Union two young men have been educated to become science teachers, and have been certificated by the Department of Science and Art during the past two years. The paper read by Mr.

Kay-Shuttleworth, on the work of the Union, is a very instructive one, and likely to be of service as relating to an organisation that has existed and work that has been done for the past ten years. The paper strongly advocates direct grants of public money to Institutions and Unions of Institutions, and urges the anomalous position of the Government in giving grants through the Science and Art Department, and refusing to do so through the Whitehall department. The success which the Union has achieved is chiefly attributed to two causes.—1. The requirement of a sound knowledge of the English subjects from all candidates. 2. The employment of highly qualified organising masters as itinerant teachers and lecturers to the classes. The paper concludes by urging the carrying out of three improvements:—1. The abandonment of merely nominal subscriptions from members of Institutions. 2. The more extended establishment of small and compact Unions. 3. A liberal assistance from Government in support of the Classes of Institutions.

PARIS EXHIBITION OF 1867.

The following notice to Exhibitors has been issued:—

1. The Exhibition is to be opened on Monday, the 1st April, 1867, and the Imperial Commission will have a review of the Exhibition complete on Thursday, 29th March.
2. To enable the British department to open with punctuality Exhibitors are requested to make the following arrangements.
3. Machinery and heavy manufactures:—When foundations are required the Exhibitor must cause them to be commenced before the 6th January, 1867.
4. All heavy machinery and objects of a cumbersome nature must be deposited in the building before the 10th February.
5. Furniture and manufactures of a heavy description must be deposited in the building by the 1st March; jewellery and textile fabrics before the 10th March.
6. Exhibitors are required, either personally or by their agents, to see to the transmission and reception of their goods in the building.
7. Exhibitors must state to the British Executive, on or before the 5th January, if they intend themselves personally being in Paris to receive and instal their goods in the building, or if they intend employing an agent; if the latter, they must transmit by the same date the name and address of the agent who will represent them.
8. A list of the persons who offer their services as agents may be seen at the Paris offices at South Kensington Museum; but the Executive Commission do not undertake any responsibility whatever in the naming of agents.
9. The British Executive will mark out on the floor of the building the sites of the different allotments made to Exhibitors. Those allotments which by the 15th February are not taken possession of, will be treated as resigned, and appropriated to the purposes of the Exhibition.
10. The Executive Commission will make the floor and place the packages in their proper places, but the Imperial Commission require Exhibitors to pay all expenses of transmission and installation of their goods in the building, the storage of their packing cases, &c.
11. All packages must be labelled with the official addresses which will be supplied by the Executive Commission.
12. The offices of the British Executive will be at 71, Champs Elysées, and will be open there on the 7th January, 1867, from nine till five p.m.—By order, R. G. WILDE, Secretary to the Executive Commission.

RAILWAY CARRIAGES.

In writing of the Prince of Wales's visit to Moscow, the Times correspondent thus describes the Russian railway carriages:—

The distances travellers have to perform in this country are so immense, and the weather is frequently so severe, that the idea of giving a sort of domestic arrangement to the cars naturally occurred to a people labouring under such disadvantages. Russian railway carriages are little houses on wheels. In the first, and partly also in the second class, their interior may be described as a saloon, with all the necessities, and some of the elegances, of such an apartment. It is furnished with looking-glasses, heated by porcelain stoves, and lit by lamps and candles. Along the sides soft divans are ranged; the middle is occupied by a mahogany table, and double windows, with red curtains, exclude not only the rude touch of the Russian air, but also the aspect of the winterly sky. The company sits or lounges about, chatting, reading, or playing cards, chess, and dominoes. The day passes pleasantly enough, and as night comes the passengers betake themselves to rest almost as comfortably as at home. By a simple process the divans are made into beds, and supplied with pillows by the attentive guard. In the first class the carriages are also provided with second stories, so to say, reached by an elegant staircase, and fitted with complete beds; in the second, if there are too many passengers to be accommodated on the divans, part of them are lodged in berths, which take the place of the rack provided in England for hats and caps. At length every one is snugly ensconced, the ordinary good wishes are exchanged, and it is night in the car. The guard and the driver only keep awake.

During the twenty hours a passenger is whirled along between St. Petersburg and Moscow the train stops twenty times at least. The stations are elegant buildings, painted red, with broad white facings round the windows and along the eaves. Without, the very picture of cleanliness—they are well-stocked receptacles of the good things of this world within. The passenger enters a large vaulted hall, scrupulously whitewashed, and paved with flags. On long tables a sumptuous repast awaits him, every plate over a lighted lamp to maintain the warmth equally necessary in this country for taste and wholesomeness. The wines and beers of every clime are represented in numerous bottles, alternating on the neatly-covered tables with steaming plates. The hall is in the bare, cold style so often met with in this country when pomp is not intended; but the viands are good, the waiters ready, and their white gloves unexceptionable. I need not say the whole affair is dear. Such luxuries as these are still regarded and paid for as exotic in this distant latitude. The station is an oasis. Round about the aboriginal race of the country lives in wooden cottages, including the whole family and their quadrupeds too, in a single room.

KRUPP'S STEEL WORKS, ESSEN, RHENISH PRUSSIA.

It may be interesting to give some idea of the vastness of these works, ranking as they do among the largest in the world, and certainly the most extensive by far of any works devoted entirely to the production of cast steel and objects manufactured therefrom. These works have gradually grown from a small factory, employing some 40 hands, and devoted then principally to making what are termed lace rolls, a speciality requiring rolls of extreme fineness of surface, as they are used for rolling out the gold wire for making bullion lace. The works have since then grown to an immense extent, and articles of a much greater variety are now produced, among which are specially, tyres, axles, springs, plates, guns, shafts for steamships, rails, rolls, &c. They employ at the present time about 10,000 men, and occupy in workshops and melting-houses, &c., nearly 600 acres of ground, of which over 50 are under roof. The dimensions of the "centre shop" are 250 feet long, 72 feet broad, and 90 feet high. This shop is furnished with a crane capable of lifting 80 tons. There are about 20

miles of railway, on which four locomotives and 150 waggons are in daily use bringing in the raw material and carrying away the finished products. In 1865 in the steel works alone, and exclusive of the blast furnaces and coal mines, there were employed 8,200 men. There were in operation in the same year 400 smelting, heating, and puddling furnaces, 160 steam engines, varying from four to 1,000 horse-power, in the aggregate 5,863 horse-power; 42 steam hammers from one to 50 tons weight, 110 smithies, and over 586 turning and other machines. There is in course of erection a 125-ton steam hammer; depth of foundation, 90 feet; weight of bed-plate, 500 tons in one casting; its estimated cost, with appurtenances, is £175,000. The consumption of coal in 1865 was over 1,000 tons; water, 200,000 cubic feet; and gas (8,000 burners), 280,000 cubic feet. The products are sent to all parts of the world, and, last year, exceeded 50,000 tons. The special work now going on at Essen is tyres and axles for railway use; and there is hardly a line in the whole world where these tyres are not running, and their great durability and consequent economy experienced. This has been evidenced recently by a set of five feet tyres running on the Great North of Scotland Railway, under a 28-ton engine, over 109,000 miles, without being tooled since they came from the maker's shops. This is considerably more than the whole life of best iron tyres. These steel tyres are made without a weld, and by a method which insures that the steel is thoroughly well worked under the hammers. The wheels of the class exhibited at Dublin were cast in one piece, and are becoming very extensively used under waggons. These works have also turned out some very large ship's intermediate and cranked shafts for sea-going steamers, which are exclusively used by the steamers leaving Bremen and Hamburg for America, the Austrian Lloyds, and other continental companies, while they are also fitted in the City of Dublin steamers, *Cannaught*, *Leinster*, and *Munster*, running between Dublin and Holyhead, and also in some of the Royal Mail Steam Company's vessels.

The gun department at Essen is very extensive, and embraces nearly a fourth of the establishment. The guns are made of all sizes, for field, naval, and heavy battery purposes; both muzzle and breech-loaders. Two of the latter were shown in the machinery department of the Dublin Exhibition last year, one a nine-pounder field gun and the other a 110-pounder ship's gun. The field gun was rifled upon the French system, and the 110-pounder upon the Armstrong multigroove principle. The breech of these guns was closed by a system that was first submitted to the Ordnance Select Committee in May, 1860, and may be briefly described as follows:—The bore of the gun runs through the whole of the piece, and through the breech end; and at right angles to the bore is cut a slot, slightly tapered, and into this is fitted a wedge or valve which is used for closing the breech when firing the gun. One of the chief difficulties to overcome in breech-loading guns is to prevent the escape of gas at the breech upon the discharge, and this was overcome by Mr. Krupp in two ways—first, by means of a cup of steel, or copper, or even cardboard, that was inserted into the bore of the guns after the charge, or was attached to the end of the powder-bag. This cup, when the explosion took place, was expanded by the pressure, and completely filled out the bore of the gun, upon the same principle as the steam packing rings in pistons. This, however, involved the withdrawal of the cup each time the gun was charged, and therefore a second plan was proposed. In the face of the valve was turned a circular recess, corresponding exactly with the bore of the gun, and into this recess was fitted an angle ring, one face of which, when the valve was in its place, was in contact with the breech and the other face in contact with the side of the circular recess; so that when the gun was discharged the gas entered the circular recess and forced the two faces of the angle ring tight up against the breech and the side of the recess, and com-

pletely prevented the gas from escaping. The valve is kept in its place by a locking apparatus. This system has been very severely tested at Woolwich with perfect success, and has also been submitted to and adopted by continental governments, more particularly Russia. Guns up to 15 inch diameter of bore are made at Essen in very large quantities, but it would occupy too much space to enter into all the details of the experiments that have been carried on. Sir William Armstrong and Company are now lining a great many guns with tubes made by Mr. Krupp. The Prussians generally attribute to those guns their signal successes over the Austrians in the late war, particularly in the decisive battle of Sadowa. The government at Berlin, after the victory of Sadowa, sent to Mr. Krupp new and important orders for rifled four-pounder, six-pounder, and twenty-four-pounder cannon, all of the same kind; and Russia, convinced more than ever of the immense superiority of the new *matériel* of artillery, demands importunately that she may be furnished as soon as possible with the 350 four-pounder rifled breech-loading cannon which she ordered some time ago from the workshops at Essen. The ponderous masses that have to be handled at Essen have rendered it necessary that the dimensions of the tools should be proportionately increased, and indeed this has now become essential from the large ingots that are being daily cast. A short time since an ingot of 45 tons weight was cast to form the material portion of a 15-inch gun; and to properly forge this even the 50-ton hammer is considered too small, as it entails much longer time, and causes the ingot to be too often heated for profitable working. There is but little doubt that the steel-makers of this country are greatly indebted to Mr. Krupp for the energy he has devoted to the manufacture of steel and its application to the variety of purposes. Steel is now entirely superseding the use of wrought iron in those parts of machinery where great toughness, elasticity, and durability of wear is required. There is hardly a locomotive used which is not running on steel tyres, and the introduction of steel rails is becoming daily of more consequence. The steel produced at Essen is all melted in plumbago crucibles, and formed into the ordinary ingot moulds, this process employing a large number of men. For the large ingots of 30 and 40 tons and upwards, from 1,000 to 1,300 men are employed at one time, occupying in the casting from eight to 12 minutes. The whole of the work, of whatever shape, that is turned out at Essen is made from these ingots, which are heated and forged until the desired density and form is attained.

Fine Arts.

MOSAICS: SOUTH KENSINGTON MUSEUM.—“Mosaic,” said Ghirlandajo, “is the only painting for eternity.” Some two thousand years ago it was practiced by Greeks and Romans, and now its revival is attempted by the Department of Science and Art at South Kensington. Processes which centuries ago were firmly established, revert once more to experiment, and an art all but lost has again to go through the successive stages of discovery. The mosaic pictures, eight in number, put up at Kensington, have received, for the most part, eulogy; and the experiment is so important and novel, that a critical description of the technical processes and the arts of design called into play may prove instructive. First as to process or material. The ancient methods are at Kensington revived with a difference. Early mosaics, the Roman for example, were composed chiefly of cubes of coloured stones or marbles. Our modern mosaics differ from the old in that they rely in no degree on natural substances. The cubes or tesserae at Kensington are entirely artificial, yet in chemical composition and

art aspect they are not identical. The terms used to designate the varied material are “glass,” “enamel,” and “ceramic,” otherwise “earthenware.” Dr. Salviati, whose name has been identified with the revived manufacture of Venetian mosaics, has (from cartoons) executed in the South Court, Kensington, the figures of Nicolo Pisano, Benozzo Gozzoli, Apelles and Giorgione, in materials termed “glass” and “enamel.” An examination of the Salviati tesserae, now before us, shows accordingly two distinct materials, a semi-transparent glass, used as the basis of gold, and an enamel as opaque as sealing wax. It would put the matter on a true scientific basis were a careful analysis made of these tesserae. Will Salviati, Minton, Maw, or Powell do this for their several manufactures? Glass and enamel, however, have this quality in common, that the surface glistens and gives off light, a quality which in turn has been deemed a merit and a defect. And here is the point upon which manufacturers diverge at the present moment. Certainly a polished surface gives greater brilliancy, and the picture when viewed at the right angle is seen at a further distance; for the same reason it remains visible in a low light approaching darkness. On the other hand there are abundant disadvantages to which a dead or mat surface is not subject; such a surface is seen in the figure of Cimabue, wrought both in figure and background, by Messrs. Minton, not in glass but earthenware. Certainly the picture is less obtrusive; it can be seen without dazzle at varied angles, and so far it approaches fresco. There is another figure, that of Hogarth, which makes a compromise between the two processes; the gold background is glazed, while the figure in material ceramic or earthenware is dead or mat. This discrepancy or contrast has been specially designed by Messrs. Simpson to give decorative brilliancy to the background, and at the same time to save the figure from distracting glare of surface. The experiment is believed to be novel in the history of mosaic art. Such improvements, indeed, as Constantine and his successors made in mosaics were all on the side of greater brilliancy; and specially is it recorded by Theophilus that the Byzantines discovered a cunning process of introducing a ground of gold under a surface of glass, whereby was shed over large mosaic works a splendour before unknown. This ingenious method, still to be observed in the mosaic pictures on the façade of St. Mark's, has obtained from Mr. Ruskin warm encomiums. And the delicate mediæval process is certainly skilfully imitated by Salviati. When the modern gold glazed tesserae are placed side by side with cubes from the façade of Orvieto Cathedral, no material difference can be detected between them. An unbroken gold background is all but an untried decorative condition in this country. But the middle ages afford a number of precedents, which may serve as guidance, such as the interior of St. Mark's, of Santa Sophia, and the ceiling in a stanza of the Vatican, painted by Raphael, in imitation of mosaics. In modern times, too, the Byzantine church of All Saints, Munich, shows a background blasing in brightest gold. For the direction of our own artists it may be useful to recapitulate the conditions essential to the right use of gold backgrounds. Such backgrounds are obviously non-natural, conventional, and decorative: the colour of the gold is intense, and requires corresponding lustre in the surrounding ornament. Such treatment necessarily implies architectonic and monumental styles. And these considerations enjoin simplicity of composition, severity in line, breadth and firmness in modelling, and decision in relief of the figure from the plane of the background. Such canons, enforced by the earliest and best examples, place mosaics in an intermediate position between bas-reliefs and paintings; and it is evident that the compositions at Kensington have been chastened and restricted accordingly. Indeed, even that degree of pictorial treatment usual to bas-reliefs subsequent to Ghiberti, seems to have been deemed inadmissible. It is a later mosaics on the front of St. Mark's,

allied to the school of Titian and Tintoret are flowing and free; and it is said that in the Pope's manufactory in Rome enamels of 10,000 different colours are used, so as to make the mosaics for St. Peter's *fac-simile* copies of the works of Raphael and the florid painters of the late Italian school. But such treatment, though not displeasing to the popular eye, has been deemed out of keeping with architectural compositions. This judgment prevails at Kensington, so that only in some small accessory details is pictorial treatment seen in the cartoons, and the completed mosaics are in liberty further restricted, so that distance and perspective have been wholly excluded. In short, the treatment approaches that of the strict Greek bas-relief; in other words, the figure and action are limited to the one plane of the foreground. This is at all events safe; the practise is at least sanctioned by the best precedent; yet, in the words of Sir Charles Eastlake, the unflinching application of these strict principles to all mural decoration were an "extreme doctrine." Doubtless it may be possible to discover a just mean between opposite extremes. The cost of the Kensington mosaics has been stated at £25 for each cartoon, and £100 to £150 more for the finished work. It were interesting to ascertain what relation this cost, calculated at the square foot, bears to that of stained glass, fresco, distemper painting, and other modes of mural decoration.

NEW ART CLUB.—"The Burlington Fine Arts Club," which was constituted in the course of last season, having found a local habitation in Piccadilly, opposite to Burlington House, the future abode of the Royal Academy, will be "opened for the reception of members," in the course of a few days. The object set forth in the prospectus is "the furtherance of knowledge of art and social intercourse in general." For this end, in addition to newspapers and periodicals common to all clubs, there will be a supply of art serials in all languages, sale catalogues, both English and continental; also arrangements are made for the exhibition of "a continued varying selection of fine works on temporary deposit, for purposes of comparison, for the acquisition of information respecting them, and as a source of general interest." Already the club numbers many of the best known names connected with the arts, and promises "a general aggregation of artistic society."

NATIONAL GALLERY ENLARGEMENT.—Notice has been given that application will be made to Parliament for power to purchase Archbishop Tension's library and school, also the parochial schools of St. Martin in the Fields, and to appropriate the same for the purpose of improving and enlarging the National Gallery.

ROYAL ACADEMY.—The new regulations, long under deliberation, having received the useful sanction of her Majesty, are printed and circulated, and will forthwith come into operation. They relate primarily to the number, nomination, election and power of associates. The concession is made that the limit of twenty Associates may be exceeded; the minimum is fixed at that number, but the maximum is left undefined. Thus, under this law, it will be possible to widen the area of the Academy, so as to make it commensurate with the art talent of the country. Then, as to nomination of Associates a change has been effected. It will be remembered that the old ordinance, which required a candidate to inscribe his name in a book, was regarded as needless and humiliating. This condition to election is now abolished, and in its stead a candidate will be proposed and seconded in writing by some friend in the Academy. The elections will be then made from the printed lists of all the candidates, and the votes and names of the voters may be known on demand of the majority. Associates are now, for the first time, endowed with votes, and thus vested with power. The election of Associates will take place in January, and of Academicians in June and December, of each year. Though the number of Associates may be indefinitely multiplied, the prospective right to a pension can never be vested in more than twenty at a time.

This safeguard will remain for long superfluous. Other reforms already resolved upon await the accession of space which the new building will afford.

Manufactures.

STEAM ENGINES.—The value of the steam engines exported from the United Kingdom showed a considerable advance in September, the total for that month having been £192,906, as compared with £168,304 in September, 1865, and £132,216 in the corresponding month of 1864. The increase observable in September was attributable to the augmented demand from British India and Russia. The aggregate value of the steam engines exported to September 30th this year, was £1,160,585, as compared with £1,458,842 to the corresponding date of 1865, and £1,130,341 in the first eight months of 1864, so that on the whole the demand for steam engines has declined this year as compared with 1865, although it presents a slight increase as compared with 1864. The value of the steam engines sent to Egypt has largely declined this year, the total to September 30th being only £66,285, as compared with £302,246 to the corresponding date of 1865, and £232,003 in the first eight months of 1864. The value of steam engines sent to Russia appears to have steadily increased during the last two years, the total to September 30th being £147,571, as compared with £108,129 in the first eight months of 1865, and £89,674 to the corresponding date of 1864. British India is also taking more and more steam engines, the value of the steam motors sent to that quarter to September 30th being £293,435, against £204,562 to the corresponding date of 1865, and £182,244 in the first eight months of 1864.

MANUFACTURE OF BOTTLE CORKS.—The manufacture of bottle corks is one of the chief sources of wealth in the province of Gironde, which produces annually about 125,000 quintals of cork. To supply the demand of the manufacture, which annually consumes 155,000 quintals, 30,000 quintals of rough cork are imported, principally from Andalusia, Estremadura, and from the district of Arenys de Mar, in the province of Barcelona; 8,000 persons of both sexes are employed in this industry. Of this number 3,340 workmen are employed in cork cutting. The annual production amounts to 1,283,000 thousand bottle corks, of the approximate value of 16,500,000 frs. The raw material may be estimated at the value of three millions of francs. The most important places where this industry is carried on are San Felice de Guixois, Palafurgell, Palajos, Darnius, and Junquera.

Commerce.

PIASSATOA FIBRE.—This dark palm fibre, now so largely used in brush-making, is very abundant, and of superior quality, on the banks of the Rio Negro, in Brazil. The value of the exports from the province of Amazonas alone in 1864 reached nearly £5,000. At the local exhibition held at Manaus in June this year, it was shown in bundles in the form of cordage, and in brooms. The cables made of it are said to be very strong.

COMMERCE OF THE GRAND DUCHY OF FINLAND.—The total value of exports of Finland amounted in 1865 to 47,899,025 marks, or about three millions sterling, namely, to the value of 16,751,835 marks by sea and 3,609,205 by land to Russia; to Norway and Sweden to the value of 3,537,511 marks. The remaining 25,000,472 marks represent the value of merchandise exported to other countries. During the same year, 1865, the total importation amounted to the value of 50,158,505 marks, of which 27 millions was from Russia. Comparing these

amounts with those of the previous year, a progress in the foreign trade of Finland may be seen. It is to be regretted that the remarkable augmentation on the importation is caused for the greater part by the scarcity which causes the Fins to seek in other markets the grain that is wanting.

BROKEN LEAF TEA.—The *Produce Markets Review* says:—"Immunity from prejudice is no more characteristic of the tea market than of any other branch of trade; and in this, as in other things, the habit of judging from appearances is sometimes carried to a great excess. Not that the habit of so judging necessarily leads to erroneous conclusions; but articles should not be condemned for looks alone, when other tests can be applied. The value of a tea is determined not only by the liquor which is produced by infusion, but also in a great measure by the appearance of the leaf previously—that is, its size, form, and colour. Experience teaches that these three are generally associated more or less with the quality of the tea itself; and hence it comes that the value of the article is determined almost as much by these three incidental considerations as by the quality of the tea after infusion, which is after all the most essential of any. Retail tea-dealers are apt to lay a great deal of stress on the secondary qualifications, because the public, as a rule, will not buy teas with ill-formed leaves, or containing much dust. We make these remarks because we think that if grocers drew their customers' attention to the fact that teas of an unprepossessing appearance were not necessarily bad in quality, there would be no great disinclination to give those kinds a trial, the lessened value of which is caused by a defect in the appearance of the sample. At the present moment there is on the market a quantity of broken-leaf, or dust, which retailers might be inclined to overlook simply on account of its appearance, but which is to be obtained of a quality, in many instances, of the finest description, although sold at less than the price for common Congou. That this is the case with a great proportion of the broken leaf tea on offer we are not prepared to assert; but in several instances that have come under our notice not only is the quality better and the flavour more agreeable than that of many other teas, for which three times as much money has been paid, but the second liquor is almost, if not quite as good as the first. And the reason of this is obvious. The boiling water acts directly upon the small fragments of leaves, instead of being retarded (as is the case with larger leaves) in its action by first unfolding the leaf, and then extracting the theine from it. By the time that the leaf in ordinary samples of tea is fully unrolled, and capable of being submitted to the action of the hot water, the liquid has lost a considerable amount of its heat, and the essence of the tea-leaf is consequently but imperfectly extracted. The only objection to the use of the broken leaf is that the particles of the leaves are apt to flow with the liquor into the cup, but this may be remedied by a little care in pouring the tea out."

COAST SEMAPHORES AND TELEGRAPHY.—The semaphores erected on the coasts of France have just been placed at the service of the commercial world. These semaphores being in relation with the whole telegraph system of the empire, captains of ships may now make known their wants, send orders, and receive instructions and news without the necessity of entering ports or harbours, or even of quitting their course for shallow waters. Elaborate instructions have been drawn up by the Ministers of the Interior and of the Marine, and sent to all the ports and chambers of commerce in France, for the regulation of the working of these coast telegraphs, the signals used being those laid down in the code of commercial signals for all the world, drawn up by a commission appointed by the English and French Governments conjointly, and approved and adopted by Belgium, Italy, Spain, Portugal, and some other powers. A system and code which, when completed, will place the ships of all the world in direct communication with the territory of every nation, is certain of universal

adoption. The English Government is now establishing semaphores along our own coasts on the same plan, and in connection with the same system of signals.

Colonies.

NORTH AUSTRALIAN EXPLORATION.—It appears that Mr. M'Kinlay, who was sent out on the experiment of settling North Australia, and to discover a more suitable place for colonisation than Adam's Bay, has returned to Melbourne without accomplishing any part of his task. The expedition started in the tropical rains, and men, horses, and all had a narrow escape of being washed away. They had not travelled a hundred miles from Escape Cliffs before they were surrounded with water. They were unable to proceed, and their retreat was cut off. In this medley a boat had to be extemporised, and the whole party descended the East Alligator. They returned to Adam's Bay, after having lost everything, and having barely saved their lives. With this return of the expedition it is supposed there will be a thorough collapse of the North Australian colonisation scheme, but the Colonial Government appear to be bound by Act of Parliament to take further steps to put the purchasers of the land in possession.

GOLD MINING IN NEW SOUTH WALES.—A bill, entitled "The Gold Fields Regulation Bill," has been passed by the Colonial Legislature. Its object is to give an impetus to gold mining by offering encouragement to capitalists, and to secure the public revenue by making it incumbent on every miner to take out a miner's right. Hitherto the gold mining operations in the colony appear to have been exceedingly tardy, and it is thought that this has been caused by, in some degree, the nature of the gold fields regulations. It is now proposed to grant leases of auriferous tracts, of from one to 50 acres on level ground and quartz reefs, and from 200 to 1,000 yards of river beds, for a period not exceeding 15 years, at £2 per acre, or £2 per 100 yards. There is plenty of gold beyond the reach of the individual miner, which can be readily and profitably obtained by associated capital and labour, and one of the objects of the Government is to encourage the formation of companies under the Limited Liability Act passed several sessions ago. This measure contemplates the abolition of all restrictions as to the mode of working, to allow each lessee to do his own work in his own way, without the intervention of local courts. There are no special provisions in regard to foreigners; the word "alien" has no place in the bill. In the course of a year or two the export duty on gold will be repealed. The necessity for this step is caused by an Act passed last session by the Parliament of Victoria, reducing the duty in that colony from 2s. 6d. to 1s. 6d. per ounce for the rest of this year, to 6d. in the year following, and bringing about its total abolition at the end of the year 1867.

IMPROVEMENT OF THE RIVER MURRAY.—The clearing away of obstructions to navigation in the River Murray is being carried on with vigour. For about 370 miles above Blanche-town the stream is perfectly free from impediment. The Murrumbidgee has been navigated for a considerable distance lately, and residents in the locality are desirous of having the river cleared of snags and sandbanks, in order that it may be traversed by vessels from a considerable distance inland. Were the stream cleared, great benefits would accrue to the squatters in those districts.

Obituary.

GAVERNI, the famous French caricaturist, died recently at his residence at Auteuil, near Paris. He was not very old, but had for some years been in bad health.

and lived a very retired life. The name of Gavarni is little known to the young generation of the present day, but his popularity some years since was deservedly great; his power of catching the peculiarities of various classes and eccentric individuals, and embodying them in an irresistibly droll manner, was extraordinary. He lived in England for several years, and his publication, entitled *Gavarni in London*, was a great success; and although he never quite succeeded in drawing English forms and faces, his caricatures of our eccentrics are full of observation and humour, and will always form a valuable volume of historical curiosities. "Punch," the "Acrobats," and the "Baked-potato Man" are amongst the most successful of Gavarni's English sketches, and the works of his pencil have supplied the foundation for thousands of caricatures of the English by some of his countrymen, who have produced innumerable variations of his designs without understanding the features which he had studied and fixed on paper with the seal of his genius.

Forthcoming Publications.

THE MECHANICIAN AND ENGINEER'S INSTRUCTOR. By Cameron Knight. (Spon, Bucklersbury.) A new illustrated work on mechanical engineering, to be completed in 24 monthly parts, of which Part I. will be issued on the 1st of January. The subjects treated will include forging, planing, lining, slotting, shaping, turning, screw cutting, &c.

Notes.

MUSEUM OF SCIENCE AND ART AT BETHNAL GREEN.—The Government have determined to propose to Parliament the establishment of a Museum of Science and Art in the east of London; and a committee has been formed to secure the necessary ground, which has been obtained in Bethnal-green. It is intended to accommodate the superfluous specimens which overcrowd all our national museums.

ROAD LOCOMOTIVE.—A Lausanne paper states that a road locomotive, constructed on a system invented by M. Schmidt, is now in constant use in the neighbourhood of Zurich, and is remarkable for the ease with which it ascends considerable inclines, drawing after it carriages containing as many as forty passengers. It is said to be easily guided, and that its pace may be regulated with great facility; it may also be very quickly stopped.

ARTIFICIAL NESTS.—The *Bulletin de la Société d'Acclimatation* states that artificial birds' nests are now made in Switzerland under the direction of the societies formed there for the protection of insectivorous birds. One of the members of a society of this description, who inhabits Vevey, having observed that many species of that kind select for nests the holes they find in the trunks of rotten trees, and that they consequently do not find it easy to settle in orchards, where all the trees are in good condition, began, twenty-five years ago, to set up rotten trunks in his grounds; and since then he has had no need to trouble himself in the least about clearing away caterpillars, that care being entirely left to his winged guests, who perform their duty admirably. His neighbours, on the contrary, who have not had this foresight, have had their orchards laid waste by a host of voracious insects. The Yverdon Society have gone the length of placing artificial nests even in the public walks and communal forests, on the borders of the lawns, &c. All those nests are now inhabited by hedge-sparrows, redstarts, creepers, and tomits, all which may be found in Switzerland as high up as the perpetual snow line. The same practice has found its way into Germany.

FRENCH AFRICAN EXPLORATION.—A general subscription is set on foot in Paris to supply funds for the exploration of Africa, proposed to be undertaken by a young officer, M. Le Saint, whose views are supported by the Geographical Society of France. M. Le Saint proposes to ascend the Nile as far as Khartoum, in Nubia, then to diverge towards the south, mount by the river of the Gazelles, and make for the heart of the country of the Niam-Niam. Should he succeed in this, he will afterwards direct his steps westward, and try and reach the French settlement of Gabon, on the coast of Guinea. Amongst the conjectures of geographers, which it is hoped M. Le Saint will succeed in verifying, are the supposed existence of a great lake between the Albert Nyanza and the Atlantic Ocean, and of a chain of mountains separating the interior basin from that of the Gulf of Guinea. Another point is to seek for the sources of several large streams which fall into the Gabon. The minimum sum said to be necessary for this adventurous undertaking is only £600, and there is no doubt that much more than that will soon be obtained.

SOCIETY OF ACCLIMATIZATION IN SOUTH AFRICA.—An acclimatization society is now established in the English colony of Natal. According to the programme recently published, the intention of this institution is the introduction, acclimatization, and domestication of animals and vegetables, both useful and ornamental, that do not exist in the colony, and to propagate indigenous breeds and products in countries where they are not known. This new society seems to be most favourably situated to facilitate the work of like societies in Europe. The colony of Natal, but yet little inhabited, is situated at the extreme limit of European possessions in South Africa, and it is in this region that the animals driven back by the progress of colonisation have taken refuge.

Correspondence.

THE ELECTRIC TELEGRAPH.—SIR,—It may interest many connected with telegraphy to know that a few copies of the remarkable pamphlet on this subject, entitled "Description of an Electric Telegraph, by Francis Ronalds, 1823," may be still obtained from Mr. Spon, of Bucklersbury. Mr. Ronalds himself is also still living at Battle, in Sussex, and his portraits may be obtained from Messrs. Maull and Polyblank. His pamphlet is one of very great interest, and well worth reading.—I am, &c.,
L. C.

London, 23rd November.

ARTIFICIAL QUININE.—SIR,—It would be exceedingly interesting to your readers in general, and to chemists in particular, if Mr. W. L. Scott would favour us with a further communication describing more particularly the artificial quinine, of which he claims the discovery. I saw the small specimen exhibited at Nottingham, where, of course, it excited great curiosity. The discovery has hitherto evaded the constant research of our greatest chemists, and its results would be so important to mankind, that I cannot understand anyone laying it aside, "owing to the pressure of other matters." In addition to a large reward offered to the successful discoverer by the French Government, an immense fortune would be rapidly acquired by any chemist who could, as Mr. Scott believes, "eventually produce a ton of artificial quinine, at a cost not exceeding the present price of half-a-hundredweight of the principle now extracted from the bark of cinchona." Although Mr. Scott significantly assures us that "a few grains" have cost him "two years' labour and considerable outlay," the fact of having produced it at all artificially would be the greatest achievement of modern chemistry. Hoping he may be induced to publish further particulars,—I am, &c.,
EDW. C. C. STANFORD, F.C.S.
1, Holyrood-crescent, Glasgow.

MEETINGS FOR THE ENSUING WEEK.

- MON.** ...Royal Inst., 2. General Monthly Meeting.

Patents.

From Commissioners of Patents' Journal, November 23rd.

GRANTS OF PROVISIONAL PATENT RIGHTS.

- Artificial fuel—2851—J. Roberts.
 Axle-boxes—2912—J. S. Cooke.
 Barrel, bungs and taps for—2908—J. K. Haywood.
 Bituminous substances, treating—2788—C. McBeath.
 Boats, lowering—2952—D. Murray.
 Book-keeping, apparatus for t-aching—2930—H. A. Bonneville.
 Boots and shoes, cleaning by machinery—2890—H. Churchman and F. Brady.
 Boring engines—2922—F. B. Döring.
 Bottles, stoppering—2833—J. Becker.
 Bottles, uncorking—2766—A. Manuel.
 Breech-loading fire-arms, and cartridges—2946—W. Clark.
 Bricks—2950—W. Piddling.
 Brushes—2812—F. Brown.
 Call bells—2852—E. Tonks.
 Carding engines—2794—S. Faulkner.
 Casks, cleaning—2846—O. C. Edwards.
 Chain links, bending—2934—H. R. J. Denton.
 Chloride of sodium, decomposing—2758—W. Weldon.
 Coal oil lamps—2958—A. V. Newton.
 Coal hoppers—2928—H. A. Bonneville.
 Compositing and printing machines—2770—N. H. Loomis.
 Core bars—2914—T. Horeley and G. Knighton.
 Gaseous pyrites, treating waste solutions obtained from burns—2855—F. Claudet.
 Electric telegraph apparatus—2874—T. Walker.
 Fabrics, tread—2972—W. Clark.
 Fibres, combing—2832—E. Tavernier and H. W. Whitehead.
 Fibrous materials, doubling—2958—J. Harding.
 Fibrous materials, preparing—1814—W. Walker.
 Fibrous materials, preparing—2831—W. S. Ashton and J. Johnson.
 Fibrous substances, spinning—2890—J. Combe.
 File-cutting machines—2944—J. H. Johnson.
 Fire-arms—2882—T. H. Inc.
 Fire arms, breech loading—2878—T. Hunt.
 Fire arms, breech loading—2970—J. G. Tongue.
 Fire, automatic apparatus for giving warning of—2962—J. S. Gibberson.
 Fire-escapes—2764—W. R. Barnes.
 Fire-escapes—2818—J. Scott.
 Galvanic batteries—2836—O. Rowland.
 Gas—2756—H. Phillips.
 Gas retorts—2827—J. J. Holden and S. J. Best.
 Gas stoves—2908—J. Thomson.
 Gloves—2844—R. Porter, jun.
 Grain, preserving—2798—J. H. Johnson.
 Hats—2708—J. Haworth.
 Hayseed chaff cutting machines—2845—J. Howell.
 Houses, &c., cleaning—2904—W. E. Newton.
 Hydraulic presses—2792—R. H. Tweddell.
 India-rubber thread—2966—C. Moseley.
 Invisible photographs, developing—2641—W. Grune.
 Iron and steel, casting—2940—N. Korshunoff.
 Iron, refining—2948—G. Crawshaw and J. Thomas.
 Iron safes—2856—J. Chubb and W. H. Chalk.
 Jewellery—2766—F. Tabino.
 Labels, protecting—2106—W. G. Gibson.
 Lamps—2778—E. Howard.
 Lamps—2428—J. H. Johnson.
 Magnetic compounds—2886—W. Darlow and P. W. Seymour.
 Metallic band fasteners—2790—J. H. Johnson.
 Metallic bedsteads—2944—D. Brierley.
 Metals, casting—2764—J. Fisher.

- Metals, rolling—2874—J. H. Johnson.
 Metal tubes—2782—P. A. Mants.
 Milling machinery—2804—J. Wilkinson, jun.

Journal of the Society of Arts.

FRIDAY, DECEMBER 7, 1866.

Announcements by the Council.

ORDINARY MEETINGS.

Wednesday Evenings at Eight o'clock :—

DECEMBER 12.—“On Old London: its Streets and Thoroughfares.” By J. G. CRACE, Esq.

DECEMBER 19.—“On the Study of Indian Architecture.” By JAMES FERGUSSON, Esq., F.R.S. On this evening Sir JAMES FERGUSSON, Bart., M.P., will preside.

CANTOR LECTURES.

The first course of Cantor Lectures for the present session will be “On Pottery and Porcelain,” and will be delivered by William Chaffers, Esq. It will consist of six lectures, and will commence on Monday evening, the 21st January next, and be continued on succeeding Monday evenings.

The second course will be “On Music and Musical Instruments,” to be delivered by John Hullah, Esq. Arrangements for a third course are in progress.

The lectures will commence each evening at eight o'clock, and are open to members, each of which has the privilege of introducing one friend to each lecture.

A new list of members of the Society has been printed, and any member can have a copy sent to him on application to the Secretary.

SUBSCRIPTIONS.

The Michaelmas subscriptions are due, and should be forwarded by cheque or Post-office order, crossed “Coutts and Co.,” and made payable to Mr. Samuel Thomas Davenport, Financial Officer.

Proceedings of the Society.

THIRD ORDINARY MEETING.

Wednesday, December 5th, 1866; CLARE SEWELL READ, Esq., M.P., in the chair.

The following candidates were proposed for election as members of the Society :—

Bentley, James, Woodgreen-park, Cheshunt.
Dyke, William Hart, M.P., Lullington Castle, Kent.
Nicholson, William Henry, St. Margaret's, Rochester.
Poole, William, Hentland, Ross, Herefordshire.
Rowley, James Campbell, 2, Clarence-buildings, Booth-street, Manchester.
Russell, T., Stubbers, Romford.
Wainwright, James Gadesden, Clapham-common, S.
Williams, John Carvell, Everdon-house, Surbiton, S.W.

The following candidates were balloted for, and duly elected members of the Society :—

Aston, J. Wood, Cradley, near Birmingham.
Bellows, John, Steam Press, Gloucester.
Birt, William Jacob, 23, Sussex-gardens, Hyde-pk., W.
Bond, John James, 39, Queen Anne-street, W., and Public Record Office, E.C.
Bosanquet, Horace Smith, Broxbournebury, Hoddesdon.
Bradley, Lonsdale, Prior's House, Richmond, Yorkshire.
Brett, Jacob, Portland Hotel, Great Portland-street, W.
Bryceson, Henry, Brook street, Euston-road, N.W.
Carr, Jonathan, Twerton Mills, Bath.
Clarke, Samuel, 110, Albany street, N.W.
Clay, Rev. Walter L., M.A., 30, Harewood-square, N.W.
Colla, Benjamin, 28, Moorgate-street, E.C.
Cooke, William, 12, Friday-street, E.C.
Dixon, John, 5, Abchurch-yard, E.C.
Ferguson, Robert, Morton, Carlisle.
Ferrabee, James, Port Mill, Brimscombe, near Stroud, Gloucestershire.
Freeman, John, Woodland House, Falmouth.
Gill, Henry Septimus, Tiverton.
Harrison, J. S., F.R.C.S., Lancaster.
Henry, Sir Thomas, 23, Hanover-square, W.
Hill, William, jun., 60, Bishopsgate-street-within, E.C.
Hynam, John, 7, Wilson-street, Finsbury-square, E.C.
Ince, Joseph, 26, St. George's-pl., Hyde-pk.-corner, S.W.
Lambert, William, 4, New Basinghall-street, E.C.
Layton, Charles Edwin, 150, Fleet-street, E.C.
Le Braithwaite, Charles, Jun., Kendal, Westmoreland.
Mair, Robert H., 65, Ludgate-hill, E.C.
McNeill, James, 35, Hopeton-street, Belfast.
Murray, Robert, Kinnahaird, Dingwall, Ross-shire, N.B.
Naylor, William, Manor-place, Paddington-green, W.
Patalano, Enrico, 5, Laurie-pl., Percy-cross, Fulham, S.W.
Perry, Joseph John, 37, Red Lion-square, W.C.
Phillips, Charles Thomas, Windsor.
Pola, John A., 26, Bucklersbury, E.C.
Pugh, Edward, Wrotham House, York-rd., Holloway, N.
Richardson, John, Tutbury, near Burton-on-Trent.
Sanguinetti, Francis B., 63, Jermyn-street, S.W.
Shields, John, Durham.
Slater, James A., 23, Denmark street, Soho, W.C.
Sorby, Thomas Charles, 27, Brunswick-square, W.C.
Strutt, The Hon. Arthur, Milford, near Derby.
Tonks, William Henry, Moseley-street, Birmingham.
Trewby, William George, Coburg-house, Waterloo-rd., S.
Watts, Isaac, Cotton Supply Association, 1, Newall's-buildings, Manchester.
Williams, Oliver John, Harwich.
Young, H., 16, Carthusian-street, Aldersgate-st., E.C.

The Paper read was—

TRADE IN FOREIGN CATTLE.

By JOHN IRWIN, Esq.

The serious losses of cattle which have been sustained in this country by the rinderpest since June, 1865, having attracted considerable attention to the foreign cattle trade, I propose to discuss the system pursued in supplying the London cattle market with foreign stock; and although the subject is one which I fear can scarcely be made very interesting, it is of such vital importance that it may not be unworthy of a little consideration in some of its leading features.

The supply of food to large cities, especially to London, is a subject of such deep moment that very great care should be observed in attempting any radical change in the system which has been in practice for a lengthened period, the disturbance of which might lead not only to great pecuniary loss and much inconvenience, but also to the disadvantage of at times being without an adequate meat supply. I am fully aware that in the opinion of some, who are perfectly conversant with the subject of both foreign and home supplies of cattle, the contingency

of having very little, and sometimes absolutely no meat fit for consumption in the London market, is not provided for by consignments from the Continent of Europe, but by the home-fed stock; on the other hand, I understand that the school to which I allude has the greatest faith in the doctrine that we should be richer, not only in the number, but in the purity of our herds, if we had never imported a single foreign animal. That the doctrine may be correct I am not prepared to controvert, but I conceive the principle as laid down to be purely theoretical, beyond the scope of actual test, and one of many questions which serve for much unnecessary as well as unprofitable discussion.

Why the foreign stock should, in the minds of thousands of our agricultural population, be placed under a species of ban, I cannot understand, unless it is that the importation prevents the high prices which would inevitably have ruled had we not been permitted to resort to our neighbours, and avail ourselves of such surplus quantity as they can afford to send us; for although it has become almost an accepted fact that the cattle plague, of which we are now happily all but free, was brought to us from abroad, I cannot find any direct evidence to that effect, neither can I trace any bearing on the direct importation of either pleuro-pneumonia or foot and mouth disease, much anterior to both diseases being well known as existing in England and also Ireland; and as far the rinderpest is specially concerned, the Royal Commission of 1865 failed to establish anything conclusive as to direct importation; and the veterinary authorities, to whom we look for a satisfactory solution, are even now undecided, and, what is not unusual, very far from undivided in their opinions on the subject.

With a peculiarity essentially English, the rinderpest, when it first broke out, was at once pronounced to be a foreign importation—that, at all events, was agreeable to our notions of purity in our own herds, and, luckily for the theorists, the Revel cargo had been in the Metropolitan Cattle Market some few days prior to the disease having been first observed, so that it was concluded, as a matter of course, that our alleged first direct Baltic importation had subjected us to the ravages of a terrible scourge. Granting that the opinion of an eminent veterinary authority is indisputable, viz., “that the first time cattle should be introduced direct from countries east of a line from about Memel on the Baltic to Trieste on the Adriatic, we should undoubtedly have the steppe-murrain, or cattle-plague,” I am at a loss to understand how we have escaped the pestilence for so many years, for the Revel cargo was not the first direct importation from Russia *via* the Baltic, but the third, though not in such large quantities; and although the Royal Commission in their report seemed to attach no importance to the theory of the Revel cargo having done the mischief complained of, it may be as well to state that some 10 or 12 years ago a quantity of cattle from St. Petersburg was landed at Hull, and, I believe, sent into Lincolnshire; a second direct importation was brought to London in 1860 from St. Petersburg, the cargo from Revel being the third instance—part of the latter having been sold in the Metropolitan Cattle Market about the 2nd June, 1865, and, coincidentally, the disease was first observed some 17 or 18 days after, on or about the 19th June, and, subsequently spreading, had by the 14th October extended to 29 counties in England, 2 in Wales, and 16 in Scotland, and was still advancing; the early cases in the provinces being said to have been traced to cattle which had been exposed in the Metropolitan market for sale, a noteworthy circumstance, inasmuch as part of the Revel cargo was sold at Hull, and thence sent to Manchester and other places, whence no Rinderpest was said to have been communicated to the adjacent districts. In the meantime, the disease had been imported into Holland—also by cattle sent from the Metropolitan market—whence it spread to Belgium and France, but in the two last-named countries the

stamping-out measures which were at once put in force had the effect of preventing any alarming spread, whereas the temporising policy permitted in Holland and Great Britain, has had a most disastrous effect, some of the Dutch provinces still suffering severely.

On this subject I will submit for your consideration the only evidence pertinent to the matter given before the Royal Commission, on which any reliance can be placed, which tends to uphold the supposition that we received the disease in question by the Revel cargo.

Professor J. Gamgee was asked the following questions:—

“2801. Referring to the Revel cargo, you stated at the Social Science meeting that three or four of the cattle were slaughtered?—Yes, at Revel; and one died at Revel; and another, I understood, was sick on the voyage.”

“2802. The impression left on my mind was that you wished to say that those animals certainly died of the rinderpest?—That is my impression.”

“2803. You have no authentic information upon that point?—Yes, I have, if it can be relied upon, from the man who had the cattle.”

It appears, therefore, that Professor Gamgee had no reliable information on this subject, unless he could believe the man who had the cattle; and after that confession, it will be as well you should hear the letter from the “man who had the cattle,” addressed to Messrs. Honch and Co., the importers of the cargo. I conclude the Professor in the evidence quoted alludes to the person sent over by the importers, as in previous questions put to him (Nos. 2643, 2644) he specially mentions him. In his letter, dated London, 3rd January, 1866, this person says:—

“I desire to express my sincere regret that I should have circulated any rumour as to your having imported cattle from Revel which were suffering from the disease called the rinderpest. Such was not the fact.”

“During my stay of seven months in Russia, in the years 1864 and 1865, I found no cases of the so-called rinderpest in Esthonia, the province in which I purchased the cattle, which were shipped by me to you in England, by the steamer “Tonning.” I accompanied that cargo of cattle, and saw them landed at Hull. They were all perfectly healthy, with no symptoms of any disorder. There was one sick on board, but it subsequently recovered, and was sent up to London and sold.”

• Before leaving the subject of the rinderpest I would draw your attention to the evidence recently given to the Royal Commission, establishing the fact of the existence at various times of some plague among cattle in England, analogous to, if not identical with, the steppe murrain or rinderpest; and it is also a strange circumstance, that in 1348-9, after the “black death” had produced great mortality among men, a grievous plague attacked cattle, which perished by thousands, whereas in 1865 the converse took place, for we had in that year the murrain among the cattle, which also perished in thousands, and, as you all know, this year has witnessed our being subjected to great losses amongst men from cholera. It is a question for those more skilled in the science of contagious diseases, as affected by peculiar conditions of atmosphere, to determine how far such a coincidence may be accounted for, but it has left an impression on my mind that in attempting to establish the theory of direct importation, we may be pursuing a fallacy, and in so doing lose valuable time in arriving at correct conclusions. To all who are desirous of thoroughly clearing up the doubt as to how we could have harboured so dreadful a pestilence, I would recommend a careful perusal of the three reports issued by the Royal Commission appointed to inquire into the nature and origin of the cattle plague, for they are well worth the consideration of every one interested in the supply of good cheap food to Great Britain, and especially so to towns

where there are large communities of poor people to be fed,—by poor people I mean those who can only afford to buy beef or mutton when it is at a reasonably low price, proportionate to the scale of wages paid.

That the necessities of our meat supplies have rendered it incumbent on us to resort to continental Europe is as self-evident as the fact of our having to go abroad for cheaper bread than we can produce at home. Theorists may say what they like as to how much beef and mutton we could produce when left to ourselves, and uncontaminated by foreign importations, but there is the fact beyond controversy that we find it expedient to purchase from the foreigner, and that we now have beef and mutton from abroad, if not quite equal to our own, very little inferior, and at a price which enables more to partake of a good meat dinner than ever the British farmer could manage to provide when left to himself.

In 1842 the importation of cattle from abroad was strictly prohibited. In 1843, however, they were allowed to be imported on payment of duty, which was found to be so high as to afford little or no margin of profit to importers, considering the prices realized abroad, and, bearing in mind the risks of the trade, which consist of the possible loss of market on arrival here, and consequent extra expense, as well as depreciation of value, apart from the sea risk of the voyage, which, if protected by marine insurance, adds a heavy additional item of expense, and does not even then cover all the casualties of the voyage. With regard to the opinion in England in 1842-43, when importations were allowed, it will be worth my drawing your attention to the following extract from M'Culloch, as showing the feeling prevalent, and the anticipated result of the measures alluded to by him. Under the head of "Importation of Cattle," he says:—

"Previously to 1842 the importation of horned cattle, sheep, hogs, and other animals used as food, was strictly prohibited, but this prohibition was then withdrawn, and the importation of the animals in question permitted, on paying a duty of 20s. a head on oxen and bulls, 15s. on cows, 3s. on sheep, 5s. on hogs, &c. This certainly was one of the most important inroads that has ever been made on the prohibitive system, and reflects the greatest credit on the administration of Sir Robert Peel. At the same time, however, the benefits of the measure are rather of a prospective and negative, than of an immediate and positive description. It will most probably lead, in the course of time, to a considerable importation, and it will, no doubt, prevent or be a great obstruction to any oppressive rise in future in the price of butchers' meat in this country, but we doubt whether it will do more than this. The apprehensions which the measure, when proposed, excited amongst the agriculturists, and the panic it occasioned, were wholly destitute of any good foundation; and the fact that the price of cattle is lower now (1843) than before the repeal of the prohibition is not, assuredly, owing to the inconsiderable importation that has taken place, but to the fact of their price having previously been quite exorbitant, and to the diminution of the consumption of butchers' meat in a large portion of the country, originating in the depressed state of manufactures in 1842 and in the early part of 1843. Indeed, we believe that their price would have been quite as low at this period (June, 1843) as it really is, had the prohibition continued in full force.

"The fact is that, low as the duties are, very few cattle can be imported into England, nor is there any such discrepancy as is commonly supposed between the prices of butchers' meat here and on the Continent. No doubt the rates at which it is quoted in the markets of the latter are, in the great majority of instances, a good deal below its price in London and other great British markets, but this difference is in great part apparent only, and depends on the superior quality of English butchers' meat, as compared with that of other countries.

"There is an immense variety in the breeds of the continental cattle; but, with the exception of the cattle

of Holstein, the beef of those in Western Europe is universally inferior to that of England; and the continental mutton is hardly eatable. In most parts of the Continent the object is to have a fine fleece, with but little regard to the carcase; whereas in England the carcase is an object of more importance than the fleece.

"Denmark, including Holstein, exports annually from 25,000 to 30,000 head of cattle, principally to Hamburg and Altona, and there could be no reason for supposing that the repeal of the prohibition against importation in this country should lessen the demand for beef in Hamburg otherwise than by raising its price. Inasmuch, however, as the beef of Holstein (which is principally cured and smoked) had hitherto sold in Hamburg for from 4½d. to 5d. per lb., or at but little below the cost of beef in England, it was evident that a comparatively small increase of price would suffice to prevent its exportation. And this in truth is precisely what has happened; for it has been found that when to the cost of cattle in Hamburg has been added the cost of their conveyance and sale to the butchers in England, amounting to at least 40s. a-head, and the duty of 20s. a-head, their price has been such that they could rarely be sold in London with a profit, and their importation has hardly been worth notice.

"But, if we except Denmark and Ireland, no country of Western Europe has hitherto been in the habit of exporting cattle. France exports a few, but her imports always overbalance her exports; and it is probable, indeed, should no change be made in the policy on which she has been acting of late years, she will cease to export a single animal. The truth is, that there has latterly been a great increase in the price of butchers' meat in France, and a material decrease in the stock of cattle in that kingdom, occasioned by the excessive additions made to the duty on the importation of cattle. Previously to 1814, all sorts of cattle might be imported into France duty free. In that year, however, a duty of three francs (2s. 6d.) a head was laid on their importation; and had the duty been allowed to continue at this reasonable rate, it could not justly have been objected to. But in 1822, this moderate duty was suddenly raised to the enormous amount of fifty-five francs, or 44s., and the result has been that, in the interval, the stock of cattle in France has been reduced about 2,000,000 head, the price of butchers' meat has been greatly increased, and the consumption of beef in Paris has declined from about 31 kilogrammes to 25 kilogrammes per individual. In consequence, loud and well-grounded complaints have been made by the town and manufacturing population of the operation of the duty, and the probability is, that it will, at no very distant period, be effectually reduced. But it is material to observe that, despite this oppressive duty, the value of the live animals imported into France in 1839, principally from England, Wurtemberg, Bavaria, and Baden, amounted to £674,775. Under these circumstances, the idea of France supplying us with any considerable quantity of cattle is out of the question. Indeed, anyone acquainted with the state of France, with the smallness of the farms, and the all but total deficiency of green crops, must treat with contempt the notion of her exporting beef or cattle. Spain, since the repeal of the prohibition, has supplied us with a few cattle, and sanguine expectations have been entertained of her capabilities in this respect. We, doubt, however, whether these are destined to be realised. The pastures of Spain are no doubt of vast extent, but it is generally believed that they are more suitable for sheep than cattle; and the voyage across the Bay of Biscay will always be a considerable obstacle to the cheap and easy importation of the latter.

"Eastern Europe, including Hungary and the southern parts of European Russia, has a vast extent of fine pasture land and some very fine breeds of cattle, with which, but for the distance, we might be abundantly supplied. Unluckily, however, the expense of their conveyance would be so very great as to preclude the

possibility of their being imported; and it is even doubtful whether we shall ever be able to derive from these countries any considerable supply of salted provisions.

"It appears, from the customs' returns, that from the repeal of the prohibition against the importation of foreign cattle, on the 9th July, 1842, down to the 5th of January, 1843, only 4,277 head of cattle (including calves) were imported, and only 648 sheep and lambs. (Parl. Paper, No. 45, Sess. 1843.) And it is well known that this inconsiderable importation was unprofitable rather than otherwise, and that there has hardly been a single animal imported during the three months ending with June, 1843. At the same time, however, it must be admitted that it is by no means improbable that agriculturists in the contiguous countries should apply themselves to the breeding of stock for the English markets; and that their importation should, in consequence, be considerably increased.

"But, supposing (of which we regret there is little or rather no probability) that in some half-dozen years we should be able annually to import 30,000 or 35,000 head of foreign cattle, and that eventually this number should be increased to 100,000 or 150,000 head, still, it is easy to see it could entail no real injury on the agriculturists of this country.

"We have already seen that, at present (1843), the average annual slaughter of cattle in London amounts to about 175,000 head, and the average annual slaughter in Great Britain is certainly not under 1,350,000 head. Hence, it appears, that even on the extravagant supposition that 100,000 head of cattle were imported, it would not amount to one-thirteenth part of our supply, and could not, therefore, have any material influence over prices. The influence of an importation of 30,000 head would, it is obvious, be all but insensible.

"In saying that an importation even of 100,000 head of cattle, which most certainly is four or five times greater than the importation will amount to for a good many years to come, would not materially affect prices, we do not reason theoretically, but on the solid foundation of experience and analogy. In 1826, for example, we imported about 57,000 head of cattle from Ireland into Great Britain; but, in consequence of the increased facilities given to importation by the introduction and extension of steam navigation, Ireland now supplies us with about 180,000 head of cattle, or between three and four times as many as we imported from her 17 years ago.

"But, instead of the price of cattle in Great Britain falling in consequence of this immense increase of importation, everybody knows that it has very decidedly increased. And, when such is the fact, is it not childish to suppose that the value of stock is to be seriously depressed, and the breeders and graziers ruined, by the admission of cattle from abroad under a duty of 20s. each?"

M'Culloch's statements and opinions, viewed by the light of our experience since 1843, lead us to the conclusion that the importation of cattle into Great Britain was never contemplated as likely to attain to such proportions as to keep down the price of beef; and it is satisfactory to find that, in increasing the number imported, we have attained a point of improvement in quality as well, which closely approaches the excellence of our own productions.

In the report of the Committee on Trade in Animals, evidence from the West-end butchers was produced, to the effect that foreign cattle and meat were never bought by them. Not only in this respect, but in many others, I am disposed to look with much suspicion on the conclusions of Parliamentary inquiries, when there are, on the one hand, for the inquirers, honourable members with possibly foregone conclusions, and on the other, men who, naturally enough, do not care to publish to the world the "secrets of the trade." When the chairman of the Trade in Animals asks a West-end butcher

whether he ever buys foreign produce to stock his shop, it is expecting too much from human nature to get a reply in the affirmative, when, by so answering, the witness knows fully as well as the inquirer can tell him, that, assuming he supplied them all, he would lose the custom of every gentleman in the committee-room; although, if talking the matter over with a confidential friend, the same witness could not deny the fact that he buys not only Jutland and French beef, but also Dutch mutton.

On this point I would refer you to the evidence of a gentleman who is a salesman in Newgate-market, who gave his evidence before the Committee on Trade in Animals, with a conciseness which must have convinced his hearers that he was at home with the subject, and whose testimony in any inquiry on the question, I consider not only invaluable, but essential to arriving at a correct estimate of the position of the trade. Being asked the following question, "Do you find the foreign meat trade in different hands to the English meat trade?" he replied, "It very much depends on the class of persons and the state of the trade at the time. As to the inferior kinds of foreign meat it is generally sold to butchers who carry on business in the poorer parts of London, or to contractors, but we have some consignments of foreign meat that are bought by the West-end butchers." It would, therefore, appear that, at least, some foreign meat is found sufficiently good to satisfy the requirements of a portion of the West-end community, amongst whom it is popularly believed that pecuniary considerations give way to matters of taste and luxury, at all events, in the main, more so than is the case with that section of the metropolitan community east of Temple-bar.

The limits of a paper such as is now before you will not admit of so full a consideration of the subject as I should wish to enter into, and I must content myself with the foregoing proof of the increasing improvement in the quality of the cattle imported, a fact which is well known to every one directly connected with the import trade, and which is gradually being admitted by all who approach the subject. To those who are satisfied of this improvement being correctly stated, it would be superfluous to urge the importance of our having, as far as practicable, unrestricted importation of cattle alive; and where opinions of an adverse character prevail I can only hope for better convictions, and I will, for the purposes of this paper, assume that the importation of cattle from abroad is an absolute necessity, and, leaving the broad question of such necessity, will at once proceed to consider the details of the system adopted in conducting the trade in foreign cattle.

As we have already seen, after the removal of the prohibition and the almost equally restrictive duty on cattle, no material importation was received in this country till 1846, the numbers standing as follows:—

	Neat Stock.	Sheep and Lambs.	Pigs.
1843	1,521 ..	216 ..	361
1844	4,889 ..	2,817 ..	265
1845	16,833 ..	15,957 ..	1,590
1846	45,043 ..	94,624 ..	3,866
1847	75,717 ..	142,720 ..	1,242
1848	62,738 ..	130,681 ..	2,119
1849	53,449 ..	129,266 ..	no return.
1850	66,462 ..	143,498 ..	no return.

after which there was no material increase till 1860, when the numbers were as follows:—

	Neat Stock.	Sheep and Lambs.
1860	104,569	320,219
1861	107,096	312,923
1862	97,887	209,472
1863	150,898	430,788
1864	231,733	490,243
1865	283,171	914,170

I am not prepared with returns showing what portions of the above were sold in London; but it may be roughly taken that of all the importations into Great Britain,

more than half the total number are sent to the Metropolitan Cattle Market; and the following figures will give a general idea of the quantities sold in the market alluded to:—

In 1842 there were 191,207 head of neat stock and 1,373,683 sheep exposed for sale in the Metropolitan Cattle Market, and after the expiration of 15 years, say in 1857, there were 261,477 head of neat stock, 1,330,630 sheep, 23,078 pigs, the proportion of British to foreign being then very much greater than it has since become, the relative quantities being:—

Date.	BEASTS.		SHEEP.	
	English.	Foreign.	English.	Foreign.
1857	208,278	44,758	1,194,975	135,655
1862	249,051	51,466	1,213,800	288,370
1863	229,392	80,238	1,152,225	338,405
1864	220,294	119,174	1,198,075	353,100
1865	177,435	144,281	967,325	657,080

Date.	CALVES.		PIGS.	
	English.	Foreign.	English.	Foreign.
1857	8,976	19,565	22,633	245
1862	6,898	20,230	28,780	690
1863	6,259	26,795	23,500	3,530
1864	6,175	29,422	27,202	5,110
1865	4,327	32,131	25,738	5,255

A rate of increase in favour of the foreign which is most marked.

In speaking of the importation of foreign cattle into Great Britain, I must explain that actual importation, in the general acceptance of the word, is the exception, the cattle being almost always consigned on foreign account to be sold by the salesmen in the market at the best possible price; the few actual importers being shipowners having vessels trading to Spain and Portugal, who bring over an occasional part cargo, more with a view of augmenting their freight than dealing in cattle as a source of profit; and I am credibly informed that the operation of importing cattle in such manner as I allude to has never left any satisfactory result, inasmuch as the foreign breeder or dealer, especially in the two countries I have mentioned, has always the advantage of markets almost as good as our own.

Cattle from continental countries, which I will shortly mention, come almost exclusively on account of dealers abroad, who consign them to the various salesmen in the Metropolitan Cattle Market, the shipments being arranged so as mostly to arrive in London in time for the Monday's market, some few arriving for the Thursday's market, but the major portion for the former. The market is open in summer about four, and in winter about seven o'clock, and, with a brisk trade, it is no unusual occurrence for one salesman to have disposed of 400 to 600 oxen by 10 o'clock in the morning, when he at once proceeds to make up his account sales, to be sent away the same evening along with Bank of England post bills covering the value of each sender's consignment. The dealings in live cattle are almost without exception conducted verbally, and it is a feature, creditable not only to the seller but the buyer, that disputes or repudiations are almost unknown; the number of salesmen to whom the bulk of the cattle are consigned being about 12 or 14, who have their drovers in attendance at the various landing-places when boats are expected, to receive such cattle and sheep as may be forwarded to their respective consignees, and convey them to the market or lairs in the neighbourhood to await their being sold.

The principal ports whence we derive our importations are as follows:—

Port of shipment.	District where cattle are fed.	Average duration of voyage.
Harlingen	North Holland	24 to 30 hours
Rotterdam	South	18 to 24 hours
Antwerp	Belgium and German districts, from the Hungarian frontier	12 to 18 hours
Bremerhaven ..	Oldenburg and part of the German districts	48 hours
Hamburg	Berlin, Magdeburg, &c.	48 hours
Tonning	Schleswig-Holstein	48 hours

From all of which, in their respective seasons, we obtain a steady and reliable supply, in addition to occasional shipments from—

Port of shipment.	District where cattle are fed.	Average duration of voyage.
Oporto ..	Portugal	5 days
Corunna ..	North of Spain	3 to 4 days
Various French ports, from Boulogne down to Caen	North of France	12 to 36 hours
Aarhuus ..	Jutland	3 to 4 days
Göteborg ..	South of Sweden	3 days*
Revel and St. Petersburg ..	Estonia	5 to 6 days

Which, however, are not reliable, especially from the last-named, owing to the unprofitable nature of the trade.

From the ports named the cattle are, as a rule, brought in paddle steamers (paddles being considered preferable to the screw for cattle) which have mostly been built for the express purpose, and fitted with every contrivance calculated to give the animals the best possible chance of going through the discomforts of transit with as little suffering as possible, so much so that I believe whatever pressure of a legislative character is brought to bear on this particular traffic, it will be found that nothing of a compulsory nature can be suggested which would not—if it has not been anticipated—be voluntarily adopted by all steam-ship owners connected with the trade, inasmuch as they are, above all people, most interested in bringing the cattle, not only alive, but in as good a condition as they possibly can; for, not only is their freight dependent upon the cattle being delivered alive, but they have an object in obtaining and retaining for their vessels a good name as cattle carriers, it being beyond question that shippers give a decided preference to vessels which are known to be “good boats.” Assuming, then, that an individual or company devotes a certain amount of capital in providing cattle-boats for any particular service, it follows naturally that unless the latest improvements are adopted, the chances are some more forward competitor will not only take away all the honour but all the freight; and consequently competition does, not only for the comfort of the animal but the pocket of the dealer, all and more than any mere government interference could bring about.

Moreover, in the matter of the comfort and safety of the animals as carried in the paddle-steamers now engaged in the service, I am quite certain, from my intimate knowledge of the sea traffic in cattle, that, as a rule, the ox fares better than inexperienced lookers on are in the habit of believing. In stormy weather great discomfort must necessarily exist, but for this there can be no remedy for either man or beast. On shipment, cattle are carefully walked into the holds of the vessels in which they are to be conveyed, the holds being divided into stalls or pens by means of strong boards and stanchions, each stall carrying from three to ten bullocks, according to arrangement, the plan adopted being to stow the cattle and pen them off so closely as to prevent them from lying down, this being found in practice to be not only the most comfortable way for the cattle, but the surest manner of bringing them safely to their destination.

* The twin-screw *Mary*, owned by Messrs. Dudgeon, the eminent shipbuilders, performs the passage under 48 hours.

In the regular cattle-boats (and, as far as the importation of London is concerned, the rule is to have boats specially fitted), attendants are provided whose sole duty is to look after the cattle, to feed them, to give them water, and, in the event of any bullock being off his legs, or what is technically called "down," to get him up again on all fours, so that he may not be trodden upon by his fellow-bullocks. Every regard is paid to proper ventilation of the vessels, so much so, indeed, that on a recent inspection of some of the regular cattle-boats to London by Dr. Thudichum it was found that the ventilation was so perfect that he could suggest no improvement. On arrival at the destined landing-place on the river the vessel is put alongside the wharf without any delay, and the discharge of the cargo proceeded with as expeditiously as possible, which usually occupies one to two hours, according to the state of the tide, the vessels regularly constructed for such service generally, when fully laden, bringing from 400 to 600 oxen and 1,000 sheep at one time.

The whole of the animals walk out of the holds by means of inclined planes, and are at once claimed according to their brands by the respective consignees, who take charge of them, water them, and lot them, until each man obtains the quantity for which he holds bills of lading. The scene which occurs on the landing of a cargo of cattle is something so bewildering to the unpractised eye, that I can easily appreciate the feeling conveyed of utter confusion and awful cruelty, especially if (as occasionally happens) there are one or two casualties amongst the cargo; but, considering all the circumstances, the operation of landing can scarcely, if at all, be much improved. On landing, or as soon after as circumstances will allow, every animal is examined by the veterinary inspectors appointed by the Commissioners of Customs, of whom there are two for London, who are members of the Royal Veterinary College, and perhaps more experienced than any other two men in the world for the functions with which they are charged, having yearly under their inspection more foreign cattle than any one else in the kingdom.

It has been sometimes alleged that the veterinary inspection, on landing, is not sufficiently strict; but if this assertion is tested by the logic of facts, it will be found utterly untenable, and in the opinion of those who are competent to discuss the question, and who are actually conversant with the inspection in force, any error will be granted to be in too harsh, rather than too lax a system in this respect. Nothing is allowed to leave the landing wharf until the medical inspector has given his permission, after which the process of delivery goes on, and the clearance of a large cargo completed. The cattle are, if upon the Saturday, driven to the respective lairs of the consignees, or to the Cattle Market, as occasion requires, and after sale are driven to the premises of the slaughtering butcher, or to the abattoirs at the Cattle Market. At one time about one-third of the cattle exposed for sale in the Metropolitan Cattle Market were bought for sending into the country, but, owing to the recent Orders in Council, this privilege has been withdrawn, and I am told the consequence is enhanced prices in many districts, where butchers are now compelled to come to London to buy in the dead meat market. The question of compulsory slaughter at public abattoirs having been so completely shelved by the report of the Committee on Trade in Animals, calls for no remark.

Assuming, then, that the importation of cattle from abroad is essential to our great meat-consuming community, I submit that the arrangements at present in force are quite equal to the necessities of the occasion, and although much might be said on the plea of humanity, much more must be considered on the grounds of necessity.

Without the supplies which we derive from continental Europe, we should unquestionably have to pay for meat in England, and notably so in London, a much

higher price than we are paying, even in those days of obnoxiously high prices, and hence it becomes a question of grave consideration how far the existing regulations bearing upon the importation of foreign cattle should be interfered with. On this subject, in the spring of 1866, a select committee was appointed to inquire into the trade in foreign animals, and although in the opinion of many gentlemen connected with the import trade, several members of the said committee entered on their functions apparently with a decided feeling against the present system, it is a noteworthy fact that the report of the committee, with minor recommendations, pronounced the trade in animals to be conducted in such a manner that there was absolutely nothing whatever to improve. In the inquiry in question, after carefully going over the evidence given to the committee, one point has occurred to me as being entirely avoided, and it is all the more remarkable from the fact that it is, without exception, the most disreputable feature of the trade in animals, whether by rail or steamer,—I allude to the cruelties of the drovers who take charge of the cattle on arrival in London. Why the men employed for such duties in London are so much more cruel than the similar class employed in foreign countries, I am at a loss to understand, but that there is a most marked difference in favour of the foreigner is an accepted fact, and I regret the circumstance, not only as a question of humanity, but because I believe that the irregularities of the casual drover, or "outsider," have done more than any other circumstance to bring the cattle traffic in London into disrepute.

In the course of my usual vocation, which brings me into personal contact with most or nearly all the drovers who frequent the river-side, for the purpose of receiving the cattle brought into London by way of the Thames, I have been struck by the anomaly, considering the wages they have to pay, of the master-drovers—a respectable and careful class of men, all charged with the responsibility of delivering valuable consignments to their employers, the salesmen in the market—being utterly unable to obtain such assistance in their business as will enable them to prevent the gross cruelties which are observable on the occasion of cattle being either landed, or driven, or exposed for sale in the market; indeed it is no uncommon occurrence that the cattle when in the market are less tenderly used than occasion requires, and this in the immediate presence of the salesman, who is powerless to check such brutality.

As a rule each master drover has leading men to take charge of each drove of cattle, and he usually trusts this charge to those who have shown themselves trustworthy to a certain extent, but his duties require his superintendence at various points, and he cannot follow every particular lot of cattle he may have to attend to, consequently he must, in a great measure, rely on his foremen. I would not for one moment have it understood that the under drovers are themselves guilty of all the enormities laid to their charge, but I am satisfied that the extra hands, men who are known as "outsiders," called in on special occasions, are not to be trusted. And so long as cattle are allowed to be maltreated as they have been, a stigma must attach to the whole class to which I refer. I have myself on many occasions interfered at the wharves when I have observed any cruelty being practised, and it has occurred that, when I have turned from the offender, he has made the poor brute suffer all the more for my interference, a circumstance, if unsupported by other evidence, in itself sufficiently disgraceful, but I have the testimony of some of the leading master drovers in London of a corroborative character. In conversing with them I have asked what remedy they themselves would suggest, but they seem at a loss to recommend any course, and can only reply that they would be glad to find men who would do their work more carefully and more free from the unnecessary brutalities they are reluctantly obliged to pass over as though unseen. I have learnt with

something akin to horror, that in the lower grades of drover society the great point ambitious spirits strive to attain is the superior dexterity with which the stick can be so applied as to produce the keenest suffering to a passing bullock, and if the operation is neatly performed, and the poor animal bellows out its agony and rushes frantically off, the operator is looked upon as thoroughly qualified and as an adept in his profession.

Such a scene is not imaginary, as every one connected with the cattle trade can vouch, but it was only a few weeks ago that I learnt from a reliable source that the practice of cruelty has been elevated to a science. I am quite conscious of the difficulties of managing cattle, especially in large droves, and that coercion of some kind is absolutely necessary, as otherwise it would be impossible to get the work done; but the malpractices at present are not only a scandal, but cause actual destruction of property, the value to the butchers of the animals being very often reduced in consequence of the bruising sustained by the superfluous thrashing they get. The remedy is one of so simple a character that Sir Richard Mayne could at once materially reduce the evil, were the police-force instructed to keep a close watch on the men who are to blame, and to press for heavy punishment at the hands of the magistrate in whose district the offender should be detected. In the case of foreign cattle driven to the Metropolitan Cattle Market from the various landing-places on the river, the only routes which are permitted by the Police Commissioners being clearly defined, as authorised for that purpose, and at each landing-wharf the roads, streets, &c., to be taken being set forth on a large board, a little vigilance on each line of driving would be quite sufficient to deter even the most accomplished wielder of the goad, after a few cases had been detected and heavily punished by the magistrates, followed by the withdrawal of the regular license which all drovers are required to have. This, supplemented by placards in the metropolitan market, and lairs at the landing-wharves, would, I feel satisfied, have a most deterrent effect, and lead to much alleviation of the suffering inflicted by the drovers.

I leave it to students of the philosophy of the human mind to account for the phenomenon of a man taking pleasure in torturing a poor, dumb animal, and will merely remark that I have invariably found the most culpable men to be the most ignorant, and, so far as education goes, not a jot better than the brutes they torture, a circumstance naturally leading to the inference that an improvement in the treatment of the cattle can only be expected as a consequence of the mental and moral improvement of the class to which I allude.

The subject of driving cattle through the streets of London is undoubtedly one of very great importance, especially when bearing in mind the already overcrowded state of the great thoroughfares of the Metropolis, and I am quite prepared to find myself at issue with the advocates of the principle of "taking the butcher to the ox, instead of the ox to the butcher," for I believe myself that the practice could never be carried out. This, of course, at the moment, is a question of opinion, and it would be more than rash to assert that any adaptation of trade to circumstances is impossible, after the experience of the past 20 years, but I doubt very much whether the system of supplying London and the other towns of the kingdom with home-fed supplies could be carried out, and I have a strong opinion as to the absolute impossibility of doing so with foreign cattle, either killed at the port of shipment or place of landing; but even admitting such possibility, it is a canon of faith amongst those more competent than myself to form an opinion, that it would be only then at a great inconvenience, a great pecuniary loss to the seller, and, consequently, increased prices to the buyers, and the certainty of, in the warm summer months, either having no meat in the market, or meat not sound enough for ordinary consumption. I shall, of course, be met with the instance of the recent importation on a large scale

from the Dutch ports of dead meat, consequent on the prohibition of the importation of live cattle, owing to the continuance of the rinderpest, which, however, is merely confirmatory of my previous assertion, for the extra cost of freight and other charges, along with the loss in value of offal, &c., increases the price of the sheep in the London dead-meat market 7s. to 9s. per head, besides which, the risk of sound delivery is not computed.

It must also further be noted, that Holland is not the only country from which we obtain our supplies, but the voyage being of shorter duration than any other cattle voyage, renders the experiment of shipping dead meat one attended with less risk than from other districts. Just in the same manner we have had large importations of dead meat from Hamburg in the cold weather, when it will keep for an almost unlimited time; but this is a question of weather and distance, and it would not be safe to rely on the supplies subject to such contingencies. In summer time the importation of carcasses, even from Holland, I apprehend would not be attempted, unless in exceptionally cold summers.

On this point, the Committee on Trade in Animals attempted to elicit from the various gentlemen who were examined evidence in favour of the proposed system of bringing the whole of the supplies into large towns slaughtered, and so avoiding the traffic in live cattle, but the object failed, and I cannot find any opinion on the subject worth following in favour of the scheme. On the contrary, I find that those who from their position are qualified to speak positively on the question, say that we cannot do without a live cattle-market; and, in effect, the Committee in their report substantiate this, for on the subject of foreign trade they report as follows:—

1. The importation of foreign cattle is very important, for, as the home supply of cattle is reduced, the importation tends to keep down the price of meat, and it appears impossible to supply dead meat from foreign ports to any but a very small extent.

2. Compulsory slaughter at a port, like compulsory slaughter at a market, is more expensive to the butcher, hampers the trade, and will diminish the importation, and raise the price to the consumer.

3. The compulsory slaughter of all foreign cattle at the port of discharge, under the recent Orders in Council, has prevented the importation of any store cattle or sheep (which was an increasing trade), much to the detriment of the Scotch farmers, who have been unable to stock their lands, and has diminished the importation of fat cattle, a trade which would otherwise have increased.

4. Although to some extent one class of butchers purchase foreign, and another class English fat cattle, yet there are many who purchase both. The separation of the markets would exclude these men from one or the other market.

5. Such a separation of the two markets seems therefore undesirable. The evil of the cattle driving in the streets might be much diminished if they were landed lower down the river than at present, and brought up by rail, whilst this course would also bring the cattle in better condition, and allow of better accommodation at the wharves.

The last recommendation necessarily leads to the consideration of how far cattle can be landed at a spot convenient to London, so as to supply the metropolitan market with live cattle without the annoyance of driving through the streets, a system which would relieve us to a great extent of the evils complained of. I must confess, however, that this subject I would prefer leaving to others to discuss, inasmuch as I am personally interested in the promotion of the scheme for landing down the river and conveyance by rail to the market, *via* the landing place at Thames Haven. I may, however, say that my being connected with this measure arose, not from pecuniary motives, but from the conviction of the advisability of cattle being landed be-

low Blackwall and conveyed direct by rail to the Metropolitan Cattle Market, so that I may, perhaps, submit my opinion as to the benefits of Thames Haven without being subjected to the charge of prejudice or interest, especially when it is borne in mind that other places for landing cattle below Blackwall or Woolwich—such as the new Dagenham Docks—will doubtless be constructed, to all of which some of the advantages of Thames Haven will apply. This latter place has been alluded to as being actually in working order, and it has the special advantage of being so situated that vessels arriving there with cattle are relieved of the worst part of the river navigation.

Thames Haven is an out-of-the-way place, consisting of some dozen small cottages, situated about 9 miles below Tilbury, on the Essex side of the river Thames, about 14 miles above the Nore, and in direct communication with London by the Tilbury and Southend line, and may be known to some present as being a passenger route much used in the summer season between London, Margate, and Ramsgate. Attention having been drawn to it in 1856-57, as a desirable landing-place for cattle, when a few cargoes were landed there from Bremen as an experiment, it was found that the anticipations of the railway lessees in whose hands it then was vested were well founded, and, had not the loss of the boat which was the pioneer of the system put an end for the moment to the operation, there is no doubt the trade would have been gradually developed. Subsequently, however, a new Bremen company started a line of several steamers to London, and, whether from action taken by the railway lessees or from the conviction that the Thames Haven route presented greater facilities I am unable to say, but they determined to adopt the new route to the Metropolitan Cattle Market, and it was found to answer remarkably well. In the meantime, the attention of the trade was directed to the practicability of relieving the over-crowded streets of London of the cattle traffic, and at the same time getting the cattle into the market both in better condition and in less time than by coming up to the landing wharves at Blackwall. About twelve months ago some gentlemen interested in the trade as cattle-salesmen and cattle steamboat owners, determined to secure the lease of the premises, with a view to extending the accommodation for landing and forwarding cattle to the Copenhagen Fields Cattle Market, which has been done, and their operations are now in full force, such cargoes as they can influence being landed there and sent at once to London to the cattle station of the London and North-Western Railway, in Maiden-lane, Camden-town, whence they have to be driven only 500 yards into the lairs of the cattle market. The advantages of landing cattle at places down the river consist of an avoidance of a three or four hours' passage up the river, where the navigation is subject to greater impediments the higher the vessel has to proceed; and in autumn especially, when fogs prevail, it is almost invariably the fact that the majority of vessels, when detained from that cause, have to bring up a little below Gravesend; indeed I have known it to be frequently the case that vessels having passed Thames Haven have encountered fog below Gravesend, and been compelled to come to anchor for some hours, during which time the cattle of course suffer very considerably from excessive heat. The advantages are equally manifest to the ship owner, inasmuch as he saves eight hours' fuel per voyage, as well as other minor expenses, and avoids the risk of navigation in a crowded river, a fact of considerable importance, inasmuch as the majority of collision cases in the Thames occur this side of Gravesend. It would therefore appear that the benefits of landing places down the river, in direct communication with the London Cattle-market, are worthy of consideration, and the experience to be gained during the ensuing year will be the best criterion.

If, therefore, the great annoyance of cattle-driving through the streets can be avoided by landing some dis-

tance down the river, having direct railway communication with the market, I consider that, so far as I am concerned, a great improvement will be effected not only in the matter of traffic, but in the pecuniary profits which will be derived both by the cattle-dealer and the shipowner, with a consequent benefit to the consumer; the only drawback being the interference with existing private rights, for it would certainly be considered a harsh measure to render compulsory any regulations which would deprive the present cattle-wharves of the revenues which their owners are warranted in representing as clearly due to them.

Public convenience, however, is the great desideratum, and it becomes a question for consideration to what extent holders of the property in question shall be compensated out of the national exchequer in those cases where such owners can show that they suffer actual prejudice by reason of the withdrawal of the privilege of landing cattle at their wharves.

By this means relief would at once be obtained from driving through the streets to the market, and the maintenance of a live cattle-market be secured, which is, I contend, a proved necessity for London; and, whichever point of debarkation may ultimately be decided upon, the two points just named should be steadily borne in mind. The traffic in cattle has increased during the past 20 years to an enormous extent, the actual importations in 1865 being 17 times as much as in 1845, and there is every reason to expect this increase to be maintained, but not if restrictions and impediments are placed in the way of importers.

The necessity of encouraging by every possible facility the attendance in our markets of the foreign dealer, will possibly be more appreciated when we consider the actual number of cattle in proportion to the population in the various countries of Europe whence we draw our chief supplies, the statement of which will go far to induce belief in my assertion that there is nothing in the condition of the stocks abroad to make it worth the foreigner's while incurring extraordinary risk, or working against vexatious restrictions.

According to the latest statistics, the number of cattle in each country named to every head of population stood as follows:—

Belgium	about	3½
United Kingdom	"	3½
Prussia	"	3½
Russia	"	3
France	"	2½
Austria	"	2½
Oldenburg }	(each)	" 1
Schleswig }		
Denmark }		
Bavaria }	"	" ½
Sweden and Holstein	"	" ½
Spain	"	" ½

From which we may conclude that, assuming my figures to be correct, if every one of the countries consumed to the extent that we do in England, there would be no margin for exportation as far as numbers go; and it is somewhat remarkable that in Belgium and England, both better stocked than any of the other countries, the prevailing cry of high prices charged for meat is most unmistakable.

In the figures to which I have drawn your attention there is, I think, good grounds for concluding that we are not likely to increase our importations to any material extent unless we encourage the trade, which encouragement will consist in a maintenance of the existing system of live markets; and, with much deference to the opinion of those who hold a contrary doctrine, I would submit that there has been no case hitherto made out for an interference with the present system of foreign cattle traffic; and unless some plan is introduced bearing marks of an improvement without the drawback of discouraging senders from supplying us with

their stocks, I cannot approve of any re-arrangement of the traffic, which would only disturb without improving our present system.

I should have drawn your attention to the subject of the relative prices and qualities of foreign and home-grown meat, the inconvenience of slaughtering at the port, or rather point of debarkation, as well as the continued prohibition of the importation from Holland, many of the districts being perfectly free from rinderpest. I find, however, that I have already occupied your attention too long, and I shall deem myself fortunate if I have succeeded in convincing any one present of the importance of leaving undisturbed, in its principal features, the existing mode of conducting the trade in foreign cattle.

DISCUSSION.

Mr. S. SIDNEY said his avocations brought him continually into contact with graziers, wholesale butchers, farmers, and country gentlemen, and he was at a loss to know where the author of the paper had derived the idea that there was any considerable class of persons, exercising the slightest political influence, who desired at the present day to limit the importation of foreign cattle into this country. Mr. Irwin might have met with a farmer smarting under recent losses from the rinderpest, who might, possibly, have said something about the loss he would sustain if an unrestricted foreign cattle trade was permitted, but as far as his (Mr. Sidney's) own experience went, all classes agreed in the importance of taking every means to secure as large a supply as possible of healthy meat. He laid stress on "healthy" meat, because infection was just as much to be feared amongst cattle as amongst human beings; but he could not support the view which Mr. Irwin had enunciated, rather than stated fully, that rinderpest was not an imported disease, and therefore that it was not necessary to have restrictions upon the foreign cattle trade. There were three or four facts in connection with this disease which were somewhat striking, even to persons not possessed of technical knowledge on the subject. It was in June, 1865, they first heard of the disease existing in this country, and since then it was well known how large a proportion of cattle had perished. When it first appeared in France, by the adoption of severe restrictive measures it was checked at once. In Ireland prompt measures had been taken to prevent the transmission of cattle from England to that island, and the result was that, with a trifling exception, Ireland had been free from the disease. In this country we allowed it to rage uninterrupted for some time. The government hesitated to adopt stringent steps, and the disease spread; but from the moment they did adopt really stringent measures it was gradually lessened. It was to be remarked that the disease amongst cattle was by no means a new thing on the Continent. In Hungary and some parts of Germany the disease was as well known to veterinary surgeons as small pox, and both the army and the police were employed to prevent the introduction or spread of the disease; the moment any outbreak took place on a farm, the premises where it occurred were isolated, and the cattle were even fed from the top of the building so as to avoid all contact with them. Many persons were of opinion that the disease had been communicated from place to place by those who were employed as inspectors. The great point, however, to be considered was, what system ought we to adopt in future for regulating our foreign cattle trade. It appeared to him that we ought to give every facility for the importation of cattle from countries which had a clean bill of health, and that the most stringent regulations should be enforced with respect to countries that were not in that condition. Holland was one of the countries where the disease was treated mildly; the consequence was, while we had suc-

ceeded in stamping it out, the rinderpest still raged in Holland. With respect to the quality of the cattle imported into this country, it was pretty well known that, as a rule, they were equal to the second-class meat, but seldom equal to the first-class meat produced in this country. The best qualities of meat were supposed to go to the west-end of London, and it was probable that, as a rule, the butchers of that locality had very little to do with foreign meat. At the time Mr. McCulloch wrote on this subject a great proportion of the foreign animals imported had been employed in various kinds of labour till they were old; they were then fattened and sent to the English market, and produced a very useful and, no doubt, very wholesome meat, but it was not of a high quality. In addition to these team cattle, in France and many parts of Germany good breeds of bulls had been imported from this country, and by two or three crosses with native cattle they had produced a good beef-producing animal, though not equal in quality to our own stock, and a very large trade was now done in that description of cattle. Very excellent cattle were sent from Portugal and Spain. These were fine animals, of an enlarged Highland type, but they were worked till they were five or six years old—some even to ten or twelve years—then fed on Indian corn and sent to this country fat. It had been said of these that they were very beautiful beasts, and when cut up their flesh was veined like marble, and was nearly as hard. He might add that when Mr. McCulloch wrote he could have had no idea of the immense change that had been effected in the foreign meat trade by the network of railways on the continent, and consequently his remarks could not be correctly applied to the cattle trade in the present day. He (Mr. Sidney) knew one gentleman connected with the metropolitan market who was in a position to receive from Vienna 500 beasts per week; these were drawn from Hungary and Galicia, and only good feeding was required to make them most valuable animals. He agreed with the author of the paper on the question of the importation of dead meat, that where there was not a market for the offal, the beasts could not be slaughtered without considerable loss. But here, again, they must look ahead. He believed the best way of disposing of an animal was that when purchased it should be taken to a well-regulated slaughter-house, and there slain, and all parts of the meat distributed. Nothing would be a more severe tax for the meat-eaters of the metropolis than that they should be compelled to concentrate the work of slaughtering in one or two places, and in the hot weather of summer be obliged to distribute the meat from those spots alone. There was, however, an important difference between requiring that suspected cattle should be slaughtered at the port of debarkation, and placing restrictions upon healthy cattle. Those interested in the foreign cattle trade would damage it if they looked for too much. Let them ask what was rational, and look to those who would have to buy meat in ten years' time as well as to those who bought it now. They might be able to supply the people with cheap meat to-day, but some years hence it might become a dearer article than it was at present, if proper and reasonable restrictions were not adopted.

Mr. BISHOP thought the rinderpest had been communicated in a way not generally suspected. It appeared to him that cats and dogs had often conveyed this disease about amongst the stock of the country. Indeed, he had himself seen a cat which was pronounced to be suffering from the rinderpest. When he was in Moldavia, in 1864, the disease had broken out there, and a Hungarian dealer in cattle told him he suspected his dog had conveyed the disease to some of his cattle, a great many of which were lost by the rinderpest. He thought this was worth noting, because the cow-sheds of London had suffered very severely.

Mr. BAILEY DENTON suggested that the discussion should not turn on the cattle plague, but on the question treated in the paper, viz., our trade in foreign

cattle. He thought an important element had been omitted—that was the question of the establishment of abattoirs. He would not state any opinion of his own as to their desirability, nor was he going to endorse the opinion of Mr. Sidney, that the wholesale killing of animals at the port of arrival was the wrong thing to do; but he suggested to those who entered into the discussion to consider whether the extension of abattoirs would not have the effect of preventing a great deal of cruelty in the treatment of the animals, besides other advantages. He could not quite endorse the views of Mr. Irwin with regard to the freedom from cruelty which prevailed in the transit of cattle across the Channel. Notwithstanding the excellence of the arrangements in many respects, he had himself witnessed the greatest cruelties in the sea passage.

Dr. CRISPE expressed his astonishment that in the present day any one should be found to support the doctrine of the spontaneous origin of the cattle plague; moreover, he felt certain that, during the incubation of the disease, it was impossible for any inspector to detect it so as to be able to select from a herd of cattle those which were positively free from infection. His own impression was that until all foreign cattle underwent quarantine at the ports where they landed, or were slaughtered at those ports, we should never be free from the disease. But the rinderpest itself was a matter of even less importance than other diseases. During the last 30 years there had been two other distinct forms of disease among cattle, viz., the foot and mouth disease, which, though it seldom killed, deteriorated the condition of the animals very much; and pleuro-pneumonia, which was more destructive than the cattle plague. There was no question in his own mind but that the disease was imported into this country by foreign cattle. He had been in the neighbourhood of Harwich, where he had seen a great many sheep affected with small-pox, which had been communicated by foreign sheep landed there, and in the early stage of that disease it was impossible for a veterinary surgeon to detect it in the animal. He thought there could scarcely be a person present who believed that the foreign trade in cattle could be stopped entirely. It must increase, but the countries mentioned in the paper were but little to be depended upon for our supplies, which, he thought, ought to come in the form of dead meat from Canada, South America, and Australia. He believed large ships would be fitted-up for that particular trade, with all the necessary arrangements for bringing flesh food to this country in a good state. His own opinion was, that in twenty years there would be a great change made in the whole meat supply of this kingdom. It had been said, with reference to the cattle-plague, that they could not enforce the restrictions made, but he (Dr. Crispe) had stated to the Privy Council, in the early outbreak of the disease, that unless they stopped all movement of cattle, killing the infected animals, and compensating the owners, the disease would never be got rid of. This plan, though not adopted at the time, was ultimately found to be the only efficient one, and the result was that the pestilence, if not wholly removed, was now very nearly stamped out. With reference to what had fallen from Mr. Bishop, he gave it as his opinion that no animal except a ruminant could take the disease, and that opinion was based on a great many experiments. He had inoculated both dogs and cats with the rinderpest; he had himself eaten the diseased meat, but without any effect, and he felt sure that the views of Mr. Bishop on this subject were erroneous.

Mr. HARRY CHESTER remarked that Mr. Irwin had brought before them many and strong arguments in favour of one particular side of a great question which had a great many sides. He (Mr. Chester) could not but find fault with the paper as being one-sided, in advocating only one method of supplying a great portion of the animal food required for the people of this country. He thought the author might have given a little more credit

to attempts which had recently been made to supply our markets with dead meat, and not appear to maintain that the only supply should be that of live cattle, brought into London by the Thames Haven Railway, which seemed to be the upshot of his recommendation. For his part, he thought the great wants of the population could never be supplied by live cattle alone. He apprehended very few would be found to propose that the supply of live cattle should be put an end to; but why they should not supplement it by a supply of dead meat, he could not comprehend. It was a matter for gratification to find that the cattle were so well cared for in respect of accommodation and treatment on the passage across the water; and it was not till they were disembarked that they were subjected to unnecessary cruelty at the hands of the drovers. He, however, remained of opinion that the arrangements for the transit of cattle were still capable of improvement. How delightful it would be if, when we had occasion to cross the Channel, we were packed so closely as not to be able to lie down, and had at the same time the advantage of knowing that if we did fall we should immediately be picked up by a humane drover, to prevent our being trampled upon by our companions. With reference to dead meat, he believed there had already been very considerable importations of it, and he had not heard of its being considered unfit for food. It might not be exactly of the quality delivered by the West-end butchers, but it had gone far to supply a great want; and if it had been introduced successfully during the summer months of the year, we might expect it to be imported on a much larger scale in colder weather. He hoped the meeting would not go away with the idea that the quantity of animal food depended on what was sent us from Holland, inasmuch as great supplies might be looked for from South America, Australia, and other countries; he would particularly mention Spain; anyone who had seen the numerous herds there of most magnificent cattle would be of opinion that large districts of that country were well fitted to supply us with beef. The Council of the Society, as many present were aware, had appointed a committee on the subject of the supply of food, and he had no doubt their investigations would throw valuable light upon the subject.

Mr. RUNKIN, having thanked Mr. Irwin for his able paper, remarked that he believed the observations with respect to the very objectionable practice of driving cattle through the streets of London would be endorsed by every person who understood the matter. He believed more cruelty was exercised by the over-driving of cattle than by the use of the goad by the drovers. Animals that arrived at Blackwall late on market mornings were driven through the streets at speeds which were most unjustifiable; and between the Cattle Market and the Liverpool-road he had seen ten or twelve beasts "down" from overdriving. He believed a large proportion of the London drovers set their faces against cruelty as much as the community at large did. He considered the system that had existed for many years past of carrying on the trade in cattle in the metropolis was one that had worked well up to a certain period; but now that London had increased to such an extent, the traffic of the streets was so great that the question was how to relieve it in any way; and public convenience demanded that the driving of cattle through the streets should cease. There was no reason why animals should be landed at Blackwall and driven thence through the streets to the market, as they might be taken direct by railway to Copenhagen-fields. With regard to public abattoirs, he was a strong advocate for them, although it was hardly to be expected that the retail butchers would at once accept the view that it was possible for them to carry on their business without slaughter-houses in contiguity to their premises; but he believed, in reference to the carcass butchers, there was no reason why the meat furnished by them should not have been slaughtered at central abattoirs. It was the custom to purchase live

in the market, whence they were sent to White- and other parts to be slaughtered, from which carcasses were conveyed in carts to Newgate and R. Abenhall, and there sold wholesale. His argument was that the animals might just as well be slaughtered in the neighbourhood where they were purchased, which would involve only one removal instead of two; one of them being the driving of the cattle through the streets. This, he was aware, would affect large existing interests, but he would not deprive any one of existing rights without due compensation. With regard to the view that it was necessary to protect the English producer from the introduction of disease, he endorsed the opinion that restrictions for this purpose were desirable, but he thought as much evil was often to be dreaded from the presence of diseased English cattle as from those imported from abroad. The cattle brought from the Continent were landed here, and taken to the market, and were not permitted to leave the metropolis alive. Now, since the 9th of November last, not a single case of rinderpest had been reported to the Markote Committee (of which he was chairman) in cattle coming from abroad. If they wanted protection against any class of animals in the markets, it was against those from the cow sheds and other places—bought by jobbing men to get a small profit out of them. He believed it would be to the interest of the large salesmen in the metropolitan market to establish at their own cost a thorough system of examination of every animal, because they should bear in mind the fact that, by an Act of Parliament or an Order in Council, if an animal suffering from rinderpest was found in the market it might lead to the total closing of it for a time, and the interests both of the producer and salesman would thereby be damaged. The practical conclusions at which he had arrived on this subject were—that the time would arrive when the driving of cattle through the streets would not be necessary, and that abattoirs should be established in suitable central positions, and that the slaughter-house and cow-house system should be abolished. With reference to the drovers, the Corporation of London had under its charge the licensing of those men, and the selecting of them was a difficult task. A system had been laid down, under which it was required that men applying for licenses should have the signatures of two respectable householders; but, as might be expected, all sorts of frauds were practised. This system, however, had lately been modified, and, he hoped, with good results. If, however, the cattle were brought direct from the water side to the market by railway, and if abattoirs were placed near the market, the necessity for drovers would in a great measure cease, except within the immediate vicinity of the Metropolitan Cattle Market, and here they would be under the supervision of masters and their foremen.

Mr. WOODLEY, as one largely connected with the carcass trade, wished to state that, as far as his own experience went, the reported cases of alleged cruelty on the part of the drovers were greatly exaggerated, and he believed a person might remain in the market all day and not see a single act of cruelty. With reference to the driving of cattle through the streets, he would remark that the route provided was generally through streets in which the traffic was not very great. The manufacturers of meat, as he might style the carcass butchers, were not limited to the Metropolitan Market for their supply. He bought cattle in the country largely, and the bulk of them never saw the Metropolitan Cattle Market, but were taken direct to his premises and slaughtered as they were required, and the carcasses sold. The whole of the East-end of London was supplied by an extensive row of shops, in which great quantities of meat were sold daily. It would, therefore, be depriving them and himself of their businesses if the slaughtering were taken to public abattoirs, as had been recommended. In the case of the great bulk of the meat only one removal took place, which was effected

by the retail butchers. With regard to the condition in which imported dead meat arrived, he could say even at the present season the loss was very considerable, and the prices as well as the supply fluctuated very greatly. If the animals were brought alive the prices could be better regulated, and it was desirable that in so valuable an article as meat the loss should be as small as possible from deterioration. On the subject of the conveyance of cattle to the market by railway, Mr. Woodley complained of the great delays that were often occasioned by that system. With respect to the Thames Haven line, unless there were adequate means of conveying the animals direct to the particular spots where they were required, he did not see that any advantage would be gained by their being sent by that route.

Mr. PAICE begged to put in a plea on behalf of the Wapping side of the question. He had been connected with the carcass trade for a great many years in that densely-populated district, and he would say that the cruel treatment of the cattle by the drovers was greatly exaggerated; as in all other classes of the community, there were some bad members, but they were as a body a painstaking, hard-working, and hard-living class of men. On the subject of the "blocks" in the streets, occasioned by driving cattle through them, he thought that the great obstructions were for the most part caused by the railway vans, and, inasmuch as the cattle were obliged to be taken by a prescribed route, he thought it no more than justice that the railway vans should be placed under a similar regulation. They might be said to be the great nuisances of the streets. With regard to the opinion expressed that the cattle disease had not a spontaneous origin, he would state that he had had a good deal to do with endeavouring to ascertain the source of the epidemic—if imported at all. Many veterinary surgeons and people connected with the trade were of opinion that it was not imported. A case in point came under his own observation. Within a few miles of London the cattle plague struck down two cows of a herd. It had been generally supposed that persons attending upon diseased animals were liable to carry the infection to healthy animals and thus spread the disease; but, in the case he alluded to, the infected cows, which were removed to a distance from the others, were attended to by the same men who attended the remainder of the herd only two or three fields off, yet they did not take the disease.

Mr. BOWMAN said, with reference to dead meat imported from abroad, it was alleged that it sometimes came in very bad condition; but it must be borne in mind that this was a new trade, without proper organization at present. It was only last summer that the first consignment of dead meat came from Holland, and a large portion of it was slaughtered by men unaccustomed to the work; the consequence was the meat arrived here in a worse condition than it would have been if the slaughtering had been properly done. Large quantities of dead meat were received from Scotland every day, in excellent condition, though the time occupied in the transmission was longer than from Holland, being in the one case 40 hours on an average, and in the other 30 hours. He believed when this trade had been longer established the arrangements would be such as to enable meat to be received from Holland in as good condition as that which came from Scotland. He considered it undesirable to have unnecessary restrictions upon the live cattle trade. As soon as it could be done safely, let the trade be thrown open, and let the exporter send the article dead or alive, as might be found most convenient.

Mr. CAMPIN said a plan had been invented by Prof. Redwood of preserving meat in paraffin, and bringing it fresh from great distances, such as South America, and concessions were now being sought for from the South American Governments, which would enable the people of this country to be supplied with essentially fresh meat from long distances abroad, and at moderate prices.

Mr. WEBBER remarked that the tendency of the discussion had been to throw them back upon old ideas. Mr. Rudkin had told them that the live cattle market had been very properly taken outside the town, while the great dead meat markets were to be retained in the central part of it, which he thought very objectionable. Wapping might be a good position for a foreign dead meat market. Formerly the great centre of the potatoe market was in Tooley-street, now it was at King's-cross. The City authorities might build markets as they liked, but every trade would locate itself in the places best suited for its purposes, and he believed the time would come when there would not be a single market of any kind in the city. If there was one objectionable trade which should be cast from the centre of a city it was the selling of cattle, and the system of abattoirs at various points of the metropolis would not only tend to the advantage of the trade, but to that of the City itself.

The CHAIRMAN remarked that they had heard the question discussed from all points of view, except his own, the farmer's point of view. This was a very important discussion, but he thought it was to be regretted that it had confined itself too much to the details of trade, rather than taking up the broad question in which all were interested, how best to supply this great country with meat from abroad. As a farmer, he might say that they wanted no sort of protection whatever. They did not dread competition, but they did dread foreign diseases, and against them they asked this country, and societies like this, to do all they could to protect them. He not only asked that on the part of the farmers, but also on the part of every consumer of meat in the kingdom; for he was sure if there was a re-introduction of the cattle-plague, and a recurrence of the sad devastation they had witnessed during the last eighteen months, it would not only be a most serious loss to the public, but cause almost entire ruin to the agricultural interest. He was sure they would not desire to separate without passing a cordial vote of thanks to Mr. Irwin for his most comprehensive and valuable paper.

The vote having been passed,

Mr. Irwin thanked the meeting for the way in which they had received his paper; he considered the views he had laid before them had not been in any way controverted during the discussion.

Proceedings of Institutions.

YORKSHIRE UNION OF MECHANICS' INSTITUTES.—*Hunslet Mechanics' Institution.*—The annual *soirée* was held recently in the lecture hall. After the tables had been removed the annual meeting was held, at which the Mayor of Leeds presided. Mr. Child, the secretary, read the report, which stated that the present number of members was 286, showing a decrease as compared with the previous year of 39. During the last month, however, 73 persons had become members of the Institution, which was mainly accounted for by the fact that the evening classes, lectures, and entertainments commenced at that period. The Institution was, unfortunately, in debt in the sum of £400, but the committee hoped that as they had been enabled in the last few years to pay off a large amount of it, it would shortly be entirely free from incumbrance. The day school and the evening classes in connection with the Institution were in very satisfactory operation and well attended, the number of students being 152 in the former, and 132 in the latter department. Much of the success of these classes was due to the fact that a very efficient and able teacher had been secured. Many of the pupils had received prizes and certificates at the examinations conducted by the West Riding Educational Board. The library contained 2,800 volumes, and the reading-room was well supplied

with current literature.—The Mayor, in the course of his address, remarked that the 'advantages Mechanics' Institutions held out to the artisans for the acquirement of scientific and general knowledge were very great, and ought to be much better appreciated, considering the fact that there never was so much necessity for their making themselves acquainted with such subjects, as they had to compete not only with the mechanics of this, but also of other countries. Of late years many articles in the manufacture of which England was thought to be superior to all the world, had been imported into this country, so that it behoved the mechanics to devote themselves more earnestly to the acquirement of such knowledge as would be useful to them in their daily avocations. It was only by their obtaining such information that the superiority of England in manufactures could be maintained.—Mr. T. B. Baines moved the adoption of the report, and expressed his opinion that although the number of the members enrolled in the Institution had fallen off, it was more than counterbalanced by the fact that the evening classes were much better attended than formerly, because, as he regarded it, the efficiency of such Institutions was to be estimated not by the number of their members, but by the proportion who received a solid education in the classes. He believed the reason of many manufactured articles having been imported into this country, as alluded to by the Mayor, was because the education of the working classes had been so much neglected.—Mr. Henry H. Sales seconded the adoption of the report, and urged upon the members that diligence, industry, and perseverance were the only means by which knowledge could be obtained, for to its acquisition there was no royal road, and all, whether rich or poor, as regarded mental qualifications, stood upon the same platform.—The Mayor then distributed the prizes and certificates awarded to the various pupils.—Mr. Councillor Shepherd moved, and Mr. Councillor Mellor seconded, a vote of thanks to those gentlemen who had furnished the funds to provide the prizes that had just been given, and especially to the president (Mr. Alderman Blackburn). Votes of thanks to those who had contributed to the funds of the Institution, to the committee, the ladies, and the Mayor, concluded the proceedings, which were agreeably diversified by the performance of a glee party. *Boothill Mechanics' Institution.*—The annual *soirée* was held under the presidency of Wm. Milnes, Esq. The report recorded a steady increase of members. The classes had been so largely attended that three additional rooms had been added to the Institute. In every subject, with the exception of advanced geography, good progress had been made. Prizes had been awarded by the committee in addition to a higher and lower grade prize, carried off by two students in the last elementary examinations of the West Riding Educational Board. The Institution prizes were presented by the chairman to the successful candidates, and the certificates and prizes of the West Riding Educational Board by Mr. Henry H. Sales. Addresses were given by Mr. W. Byles, of Bradford, and other gentlemen. An excellent selection of music was sung by the choir.

PARIS EXHIBITION OF 1867.

The following memorandum has been issued for the information of exhibitors of machinery:—

1. The pressure of steam in the boilers will be 60 lbs per square inch, and somewhat less in the Exhibition building, according to position. Water can be had under a pressure due to a few feet head above the floor level from a main within a moderate distance from each exhibitor's space.
2. Water under a pressure due to a head of 98 ft. can be had on demand, by laying a pipe from the main which adjoins one side of the British space. Steam

be exhausted into pipes, which will be within moderate reach of each exhibitor.*

3. Waste water will be run into a conduit, also within easy reach of each allotment. The original ground under the machinery gallery is not reached for some 7 or 8 feet from the floor level; the made ground, in, however, well consolidated.

4. Exhibitors must bear in mind that it rests with them to make due provision for everything in the way of water, steam, and exhaust pipes, foundations, counter-shaftings, &c., that their machines may require.

5. Exhibitors can make their own arrangements for driving pulleys, but in case it should suit their convenience to find pulleys ready for them on arrival, a list of prices is sent herewith, at which drums can be supplied and fixed on the main shaft.

6. Exhibitors wishing to avail themselves of this arrangement can do so by direct agreement with Messrs. Bryaz, Donkin and Co., Grange-road, Bermondsey, who are the makers of the shafting.

7. When the drums are on the shaft they can be keyed up by the exhibitors, to suit as to position their requirements. All pulleys put up after the shafting is in its place must be in two halves. No pulley not made in halves can be removed from the shafting without being broken off.

8. The largest pulley that can be used is 3 ft. 6 in. in diameter.

9. The diameter of the driving shaft opposite the space of is inches.

10. All cotton waste, wipings, &c., must be kept in a metal box.

11. To ensure the public safety exhibitors will be required to fence off machinery in motion in such a way as the Commissioners may deem necessary.

12. After the 1st of March the various lines of shafting will be run at intervals to afford such exhibitors as may require it an opportunity of trying their machinery.

13. The whole of the machinery must be completely installed by the 15th of March, on which date a general trial will take place.

14. Exhibitors are requested to bear in mind the difficulties of transport which are likely to ensue from the blocking of the railways, and to take the earliest opportunities of despatching their goods. They are reminded that without the co-operation of the exhibitors the British Executive are powerless to uphold the national character for punctuality, which they earnestly hope will not suffer in the hands of any of those concerned in the Paris Exhibition of 1867.—By order, R. G. WYLD, Secretary to the Executive Commission.

London Office, South Kensington Museum.

Paris Office, 71, Avenue des Champs Elysées, Paris.

RECRUITING AND EDUCATION.

The following letter appeared in the *Times* of the 28th ult. :—

SIR,—While education is making great changes in the habits of the whole people, which exercise an influence on recruiting for the army, the military authorities who discuss the subject show an imperfect sense of their importance. Education indisposes young men to be entrapped by the recruiting sergeant, as they were accustomed to be before Parliament voted its first £30,000 for national education 30 years ago. And popular education is likely to increase with increase of wages, making recruiting on the old-fashioned system in vogue during the war—the worst period, perhaps, of modern British history—more and more impossible. Whether or not military men like the notion, the soldier of the future will become a more educated and intelligent animal; and they must therefore admit these changes, and be prepared to deal with them.

* A plan will be issued showing the general arrangements of the lines of shafting and steam pipes with reference to the exhibiting space.

There is no reason to deplore the growth of education, even as respects fighting purposes. The present remarkable position of Prussia shows what educated soldiers can do. These Prussians are soldiers who can all read and write and pray, and have shown that they can fight as well as Englishmen, while the majority of our soldiers do not possess any one of these three qualifications to the same extent.

If properly dealt with my own belief is that education may actually be made auxiliary to reorganising our army on a proper basis, consistently with the changes of the times.

There is no gainsaying the views you expressed in the *Times* of the 22nd of November, and again to-day, about the connexion between the Militia and the standing army, and that the militiaman must have more affinity with the regular soldier, and be qualified to enter the line at a moment's call, and to effect this we must go beyond the sergeant and the pothouse.

In my opinion, if England is to maintain her position and her dependencies, especially in India, we must begin our training of soldiers at the National Schools. I say, make drilling a part of the work of every school aided by public funds. My experience in my own parish convinces me that there would be no difficulty in doing so. My "yokels" would read and write, and sing in church, and follow the plough, all the better for some drilling. And there is nothing children like better than physical action. Drilling twice a week would be very popular, and impede no other studies, but really help them. Let the State make an allowance upon every child who annually shows good results in drilling, as it is doing now for morals, reading, writing, and ciphering. In our retired soldier pensioners the nation has drillmasters already made and at hand.

When the youths leave school, continue a bounty on drilling, and it will be the fault of the Government if there be not an ample supply of militiamen and future soldiers. But they must be induced to become soldiers by self-interest, animated by a feeling of patriotism, which may be encouraged. Give up altogether the entrapping by tipping in pothouses; rather reject the scamps than try to catch them. Treat the soldier as a skilled labourer, as he is, and treat him well, but as strictly as you please. The Government must compete with the labour and emigration market, and beat it in price. I see no insuperable difficulties in making all the grown men of the country militiamen if the drilling and their ordinary occupations be properly adjusted. The organization must obviously be local, as the Marquis of Salisbury and others have pointed out, and it need not be over costly. I am no financier, but if we could get wisdom and responsibility to undertake army management, I believe the present expenditure of millions might be made to go much further.—I am, &c.,

A COUNTRY CLERGYMAN.

Nov. 28.

Fine Arts.

LOWESTOFT PORCELAIN.—The most complete collection of this extinct manufacture yet seen has for some weeks been on view in the South Kensington Museum. The many hundred specimens which illustrate the divers styles of pottery and porcelain made at Lowestoft have been brought together by Mr. Chaffers, from private collections, a task all the more difficult from the want of any distinguishing mark on the ware. The manufactory was established more than one hundred years ago, in consequence of the discovery at Lowestoft, a town on the Suffolk coast, of choice clay, and it became extinct early this century, partly because it could no longer compete with the Staffordshire potteries, which had command of coal on the spot. At the time of its greatest prosperity Lowestoft employed seventy workmen, and the wares found a market in London and throughout the country,

as well as in Holland and Turkey. The five cases at Kensington display, as to material of manufacture, specimens of earthenware, and of hard and soft paste porcelain, the hard being a rare speciality; and as to art, they exemplify the comparatively rude manner of Delft, the design and colour of the East, with points of approximation to French and German styles. It has been sometimes conjectured that these wares were as to body made in the East, and brought to Lowestoft merely to be painted. But Mr. Chaffers, in his volume on "Marks and Monograms," has rebutted the assumption. This collection, however, shows that Lowestoft porcelain, like most other European manufactures, was, in art and manufacture, as close a copy of Oriental as it was possible for infant Western factories to make. Some of these specimens are also allied to Dresden ceramic wares, and others to French, the latter approximation being sufficiently explained by the employment of a French refugee as decorator; other styles or motives again are expressly English, testified by the inscription "Wilkes and Liberty." The combination of subjects indeed is as violent as of styles, thus we find a group of mandarins associated with "Elizabeth Buckle." There are also to be observed very varied degrees of technical excellence, not only in the handling, but in the colours; the enamels especially have a gem-like transparency and lustre. Generally speaking the best works are those which approach most nearly to Oriental originals, but the translation of Eastern into English modes is often anomalous and uncouth. Yet some few of these imitations have rare merit for design; for lightness, as in the egg-shell fabric; for modelling of patterns in relief, and even distribution of conventionalised surface decoration. The whole collection is eminently instructive. Lowestoft ware has been little known. Not a single specimen was seen in "the loan collection" of 1862. Henceforth, however, the historian will be able to add an important chapter in the annals of the ceramic arts in England, hitherto all but a blank.

Manufactures.

PROPOSED AGRICULTURAL PRIZE IN FRANCE.—The Agricultural Society of Compiègne has opened a subscription, amongst its members and supporters, for the establishment of a great prize of 100,000frs. (4,000) to be awarded in the year 1868 to the inventor of the most efficacious system of mechanical cultivation. The want of labourers in agriculture is severely felt in France, and there seems to be a fear that the scarcity is more likely to be increased than otherwise, and the Society of Compiègne expresses the hope that mechanical science, which has already done so much for agriculture, will find the means of applying to small parcels of land the same, or similar, economical methods which have been introduced with so much success on the large scale. It is to be feared that the problem thus stated is impossible of solution, one of the essential elements of success—extent of area—being wanting; but the offer of the Society does not relate exclusively to small properties, but to methods of cultivation generally, and there is no doubt that the prize which is to be offered will act as a healthy stimulant to inventors.

Commerce.

AGRICULTURAL PRODUCE IN TURKEY.—The harvest of cereals is finished at Adrianople. It leaves nothing to be desired as regards quantity and quality. It is calculated that the province of Adrianople, that produces generally barely sufficient for its own consumption, this year will be able to export upwards of 200,000 hectolitres of wheat and rye, and 100,000 hectolitres of barley. As to the provinces of the Philippopolis and Slimnia, the abund-

ance there is such that they may easily export upward of one million hectolitres of corn. This state of affairs would have been most favourable if the scarcity of water in the Maritza, occasioned by four months of dry weather, had not rendered the navigation impossible. The province of Slimnia, more favourably situated, sends its produce to the port of Bourgas, on the Black Sea and has effected numerous sales at the prices of from 22 to 24 piastres per killow of Constantinople (8-77 killos = 1 quarter) for hard wheat, and 22 to 23 piastres per killow for soft wheat, 10 piastres for rye, and 9 piastres for oats, free of expense on board ship. The production of cocoons in the province of Adrianople amounts to 132,000 okes (39-53 okes = 1 cwt.), of which two-thirds have been shipped for Marseilles, and the remaining third is reserved for the supply of the European silk factories in the country. The province of Philippopolis has produced 32,000 okes of cocoons of mediocre quality, which have been wound on the spot. The sale of the tithes of the agricultural products of the Vilayet of Adrianople, that comprises the five provinces, of Adrianople, Philippopolis, Slimnia, Rodosto, and Gallipoli, produced a revenue of 43,000,000 of Turkish piastres to the Imperial Treasury.

PERUVIAN SILVER MINES.—Silver and gold are extracted in various places in Peru; but the only mines of importance are the silver mines of Pasco. Silver sometimes is found in native state, but most often in sulphides of silver, in argentiferous pyrites, carbonates and sulphates of copper. The processes made use of at Pasco are primitive; the wet ore is crushed by means of machinery put in motion by water power. From thence it is placed on the circo, basins of masonry within low walls. It is mixed with 10 to 11 per cent. of sea salt and turned with a shovel, and horses or mules are driven round upon it for several hours; quicksilver is then added and afterwards lime. This mixture is allowed to rest for two or three months, then it is put into bags, and an amalgam of silver and mercury is obtained free from any foreign matter. The amalgam is enclosed in large earthen jars, at the mouth of which a gun barrel or iron tube is fixed, that leads to a vessel full of water for condensing the quicksilver. It is then heated, the mercury evaporates, and the silver remains. A great loss is caused by this rough process; 75 per cent. of the mercury employed disappears. The slowness of this process, the loss that it causes, the scarcity of labour, all these have greatly diminished the working of the Pasco mines, and Peru scarcely yields annually gold and silver to the value of six million piastres.

OLIVE OIL IN THE ISLAND OF SARDINIA.—According to the official statement, the cultivation of the olive tree occupies an area of 7,600 hectares, about 19,000 acres, in the northern part of the island, where it is carried on on a large scale. The oil of this country is much esteemed in commerce; it is of fine colour, limpid, and aromatic, when the gathering and the crushing have been done quickly in the proper seasons. Unfortunately, these two most important operations for producing oil both good in quality and quantity, are rendered fruitless by the scarcity of manual labour. The olives, after being gathered from the tree, are allowed to remain undisturbed for more than a month on the ground. By this means they are dried, and lose a part of their volume. They are then passed through a mill, and undergo a fresh loss caused by the fermentation of the fruit. The process of crushing is very primitive. The mills are turned by horses, and the paste is made by hand. With a better process the produce might be increased 25 per cent. The average cost of cultivation, pruning, gathering, and crushing of the olives, is about 42 frs. per hectolitre, or 420 frs. per hectare, taking the annual produce per hectare at 10 hectolitres of oil. The average price of oil on the spot for the last five years has been 100 frs. per hectolitre, to which 6 frs. must be added for carriage to Porto Torres, and 1 fr. per 100 kilogrammes for export duty, should the supply

be sent to France. The oils of *resence* are worth from 60 to 65 frs. per hectolitre. Nearly all the edible oil of Sardinia is exported to Genoa. The inferior qualities are mixed with the oils named oils of *la riviera*; and the *resences* are principally sent to Marseilles. The freights for Genoa and Marseilles are about the same; usually 3-50 frs. per hectolitre by steamboat, and 1-50 frs. by sailing vessel. Of the four to five million hectolitres of oil of *resence* produced by the island of Sardinia, about half is exported to France.

Colonies.

THE INTERCOLONIAL EXHIBITION.—The Sydney Government has appointed the Commissioners for the Paris Exhibition to act as Commissioners for the Intercolonial Exhibition, and has placed a sum of money at their disposal for the purposes of the latter undertaking. The whole of the Australian colonies will therefore now be represented at the Exhibition; and there is every prospect that the display will be worthy of their extent and resources. The building in which the Exhibition is to be held is rapidly approaching completion. Its internal accommodation is spacious, and will afford abundant room for the advantageous display of the various articles. Upwards of 20,000 feet of space have been applied for, without taking into account what will be required for the local Exhibitions at Beechworth, Ballarat, Castlemaine, Sandhurst, and Sale, and irrespective of the accommodation that will be taken up by the neighbouring colonies. The number of exhibitors from Victoria alone will be about 400, and it is calculated that altogether the catalogue will contain a list of 1,000 exhibits.

PROTECTION IN VICTORIA.—An agitation for protection has been carried on with activity in this colony, and several meetings have been held, the most important of which was at Ballarat, where the following resolution was passed:—"That it is desirable to form a District Farmers' League in Ballarat, to secure an extension of the present tariff, so as to impose a duty on imported grain, and encourage the cultivation of the soil of the colony, and thereby promote labour, and retain in the country the large amount of capital which is annually sent to foreign countries for cereals which can be produced at home if fostered and encouraged." Other resolutions were passed at other meetings, the most notable of which was that such a corn-tax should be imposed as would prevent foreign wheat from being sold in the colony under 7s. per bushel, that being a maximum rate in the markets, and far above the average price.

EXPORTS OF SOUTH AUSTRALIA.—The total exports from the colony of South Australia, for the year 1861, were £3,129,846, against £3,305,699 for the year 1864, showing a decrease of £175,699. The total exports sent during 1865 were distributed as follows:—

Great Britain	£964,900
New South Wales	557,680
Victoria	124,464
Tasmania	10,645
West Australia	28,500
East Indies and China	77,200
Mauritius	3,525
Other British Possessions	242,220

The value of breadstuffs exported during the year was £1,228,480; and of the minerals, £620,000.

Publications Issued.

ELEMENTS OF CHEMISTRY, THEORETICAL AND PRACTICAL.
By W. A. Miller, M.D., LL.D., Professor of Chemistry, King's College, London. (*Longmans.*) Part III. Organic Chemistry.—This is the concluding volume

of the third edition of Professor Miller's Chemistry. The most important changes in the present edition consist in the adoption of the new form of notation, and in a recurrence to the system of nomenclature introduced by Berzelius. "This nomenclature," says Dr. Miller in his preface, "has been occasionally used ever since it was proposed, but it was not extensively adopted by chemical writers in this country until its merits were prominently insisted upon, two or three years ago, by Professor Williamson." "The system," he adds, "possesses advantages in brevity and precision which will, there can be little doubt, lead to its gradual substitution for the older nomenclature." "The change in notation," he continues, "will doubtless be attended with more inconvenience; though it is certain to be adopted, since in none of the recent investigations made in this country, and very few of those made on the continent, is the old method made use of."

Notes.

THE SCIENTIFIC CONGRESS OF FRANCE.—The meeting of this association, which was to have taken place during the summer at Amiens, but was prevented by the visitation of the cholera, is appointed to be held at Aix, in Provence, on the 12th of December. Many important communications relative to questions in physical science, geology, botany, medicine, archaeology, literature, the fine arts, agriculture, and philosophy, are promised by savants and amateurs of the South of France. A second meeting is announced to be held at Nice during the four last days of the same month.

Correspondence.

MOsaics.—SIR,—There appears to be much difference of opinion on the subject of this art, which is simply that of copying a good picture by means of different coloured tesserae, instead of colours laid on with the brush. The matter of which the tesserae may be composed is of little importance, excepting for the position in which the picture is to be viewed, the only rules being that the whole of those used for one picture shall be of the same texture and uniform colour respectively throughout their substance, so that after finishing, the whole may be ground down to a perfect level surface of fine grain, but not polished, except in the case of the Roman miniature mosaics. A variety of materials have been used, but there are three only of any importance:—First, various coloured marbles, expensive, and ill adapted to form brilliant pictures. Second, baked clay, terra cotta, or china, provided it is dead, and not enamelled. Lastly, smalt, enamel, or amorphous glass. The last is the only material used for the Roman miniature mosaics, for which purpose the smalt or amorphous glass of every shade and colour is drawn out to great fineness, sometimes less than a common bristle, in order that the divisions where the cement appears may be almost invisible. The smalt threads are notched with a file, and broken off as wanted. The Roman artists will grind down and repolish the surface of their beautiful lava snuff-boxes for such purchasers as may have some doubt that the beautiful picture before them may not be the result of some variety of enamel painting. The size of the tesserae depends upon the distance from which the picture is to be viewed. Those in the dome of St. Peter's at Rome are more than half an inch square, and yet they form perfect pictures. In any case the surface must be ground down level after the tesserae are fixed and the cement set, or they cannot be considered true mosaics.—I am, &c., HENRY W. REVELLY.

LIMITED LIABILITY.—**SIR,**—The time for discussion on the above paper having nearly expired, my remarks were somewhat rapidly delivered, which has, I presume, led to the reporter giving an inaccurate account of them. I wholly disagreed with limited liability, both in principle and practice, and what I really stated was, that if limited liability had fulfilled, even in a small degree, the anticipations of its promoters, it would have been one of the greatest successes of the age; that the two principal arguments in its favour had broken down, viz., the security of the uncalled capital, which was now being reduced in nearly all concerns, and the small amount each shareholder would have to pay, rendered inoperative through the number of individual shares being unlimited. I trusted to individual energy in private firms to improve arts, manufactures, and commerce, rather than to irresponsible secretaries, interested managers, indifferent directors, and pliable accountants, concluding with the remark that, in my opinion, it was a disputed point whether the want of honesty was most apparent in the conception or realisation of the scheme. Having always persistently opposed limited liability, I am sure late events have not been calculated to induce me to alter my opinion.—I am, &c., **JAMES FIGGINS, Jun.**

Journal of the Society of Arts.

FRIDAY, DECEMBER 14, 1866.

Announcements by the Council.

ORDINARY MEETINGS.

Wednesday Evenings at Eight o'clock:—

DECEMBER 19.—“On the Study of Indian Architecture.” By JAMES FERGUSSON, Esq., F.R.S. On this evening Sir JAMES FERGUSSON, Bart., M.P., will preside.

CANTOR LECTURES.

The first course of Cantor Lectures for the present session will be “On Pottery and Porcelain,” and will be delivered by William Chaffers, Esq. It will consist of six lectures, and will commence on Monday evening, the 21st January next, and be continued on succeeding Monday evenings.

The second course will be “On Music and Musical Instruments,” to be delivered by John Hullah, Esq. Arrangements for a third course are in progress.

The lectures will commence each evening at eight o'clock, and are open to members, each of whom has the privilege of introducing one friend to each lecture.

A new list of members of the Society has been printed, and any member can have a copy sent to him on application to the Secretary.

SUBSCRIPTIONS.

The Michaelmas subscriptions are due, and should be forwarded by cheque or Post-office order, crossed “Cutts and Co.,” and made payable to Mr. Samuel Thomas Davenport, Financial Officer.

Proceedings of the Society.

FOURTH ORDINARY MEETING.

Wednesday, December 12th, 1866; G. GILBERT SCOTT, Esq. R.A., F.S.A., in the chair.

The following candidates were proposed for election as members of the Society:—

Addis, S. J., 49 and 50, Worship-street, E.C.
Becke, John, Northampton.
Bosanquet, Samuel Richard, Dinastow-court, near Monmouth.
Glendining, Alexander, jun., Redleaf.
Jobson, Robert, 32, Great St. Helen's, E.C.
McCurick, T. W. Bitterley-court, Ludlow, Salop.

The following candidates were balloted for, and duly elected members of the Society:—

Bruce, Rt. Hon. H. Austin, M.P., Duffryn, Aberdare.
Carter, H. H., Park-valley, Nottingham.
Clarke, William Henry, 5, Size-lane, E.C.
Cliffard, Hardinge Stanley, Q.C., Inner Temple, E.C.
Gilbee, W. A., 4, South-street, Finsbury, E.C.
Hooper, George, 246-248, Regent-street, W.
Humby, John, 48, Little Britain, E.C.
Manning, T. E., Eversfield-house, Bratton Clovelly, North Devon.
Rigg, Jonathan, Wrotham Hill-park, Sevenoaks.
Wood, John, Whitfield-house, Glossop.

AND AS HONORARY CORRESPONDING MEMBERS:—

Calabale, Le Commandeur G. B., Consul de Monaco, Naples.
Manfredonia, Prof. Docteur Giuseppe, Naples.
Schvob, Le Docteur Alexandre, Strasbourg.
Tortorelli, Le Comte Hercule Malvasia, Naples.

On the table were shown specimens of india-rubber fabrics deodorised by Bourne's process, as well as an arrangement in which this deodorised india-rubber is applied as a “flexible diaphragm” in vessels, with a view of preventing injury to liquids from contact with air when drawn off at intervals. A description will be found at p. 62.

The Paper read was—

ON OLD LONDON; ITS STREETS AND THOROUGHFARES.

By J. G. CRACE, Esq.

There are many here, I have no doubt, who are more capable than myself of talking to you about old London; but I was emboldened to take up the subject because I thought that the large collection of plans and views which I possess would enable me to render it interesting to you, and supply, by illustration, the defects of my description. This collection of maps, plans, and views of London was formed by my late father; he laboured at it (it was a labour of love with him) for the last thirty years of his life, and I believe it is considered to be the most complete collection ever brought together; only a very small portion of it is exhibited on these walls, the entire series filling more than fifty portfolios.

At what period London was founded is unknown. There are, of course, various traditions; but it is certain that the City existed before the Roman occupation of Britain. Tacitus mentions in his annals that about 60 years after the birth of Christ it was then renowned for the vast number of merchants who resorted to it, for its widely-extended commerce, and for the abundance of every species of commodity which it could supply. In the “Itinerary” of Antoninus, it is related that 15 iters, or roads, terminate or commence in London.

A reference to the maps will explain the extent of the City and the line of walls built by the Romans, of which many parts are to be found at the present day. These walls were built of stone, with intermediate layers of bricks at certain intervals, in the usual Roman style, and were about 20 feet high and 9 feet thick; the walls were further protected by towers. The course of the wall was as follows:—Beginning at a fort occupying the site of the present Tower of London, the wall was continued by the Minories to Aldgate, thence by a curve to Houndsditch, and by Bishopsgate Churchyard to Cripplegate; then turning southward by Cripplegate Churchyard and Monkwell-street, it approached Aldersgate, and continuing south-west it curved round St. Botolph's Churchyard, Christ's Hospital, old Newgate, and on to Ludgate, then westerly to little Bridge-street, where, turning south, it skirted Fleet Brook to the Thames, where it was protected by another fort. The extent of this wall was about two miles and one furlong.

Another wall, of which no traces now remain, skirted the Thames between the two forts; this measured one

mile and a quarter, and it had two gateways, one at Dowgate, the other at Belins-gate, or, as we now say, Billingsgate.

The relics of Roman London, which are frequently met with at a depth of from 15 to 20 feet, indicate that there were many buildings of considerable magnificence and extent. Tesselated pavements of great beauty have been found in excavating in Leadenhall-street, Fenchurch-street, Lombard-street, Thames-street, and other localities, besides the remains of baths, altars, statuary, &c. London stone is said to have been a Roman milliare, from which the roads were measured as from a centre, as may be seen in the map. This stone is now reduced to a small lump, encased in a hollow pedestal, placed in Cannon-street, against St. Swithin's Church.

The Romans occupied Britain for about 400 years, and retired at last when they found it necessary to withdraw all their forces to protect their own frontiers from the attacks of the northern barbarians. After that we learn that London suffered fearfully from all kinds of ravages, by the sword, by fire, and by plague. It was occupied by the Danes, and taken from them by the Saxons, under King Alfred, yet, notwithstanding all these difficulties, it still preserved a considerable commerce. After the battle of Hastings, London for a time resisted the Conqueror, and the citizens, before submitting to him, exacted a charter, which is still preserved in the City archives. It is finely written, on a slip of parchment, about six inches long and one broad, and translated reads thus:—"William the King greeteth William the Bishop and Godfrey the Portreve, and all the burghesses within London friendly, and I acquaint you that I will that ye be all there law worthy as in King Edward's days; and I will that every child be his father's heir after his father's days; and I will not suffer that any man do you wrong—God preserve you."

It is a remarkable fact that no mention of London occurs in the Domesday Book.

Soon after this period, in the reign of King Henry II., about 1170, we have a most interesting description of London, written by Fitz Stephen, a monk, who was in the household of Archbishop Thomas à Becket, and present at his martyrdom. If you will allow me, I will read you a few extracts from it; it is entitled—"A Description of the most noble City of London.—Amongst the noble and famous cities of the world, this of London, the capital of the kingdom of England, is one of the most renowned, on account of its wealth, its extensive trade and commerce, its grandeur and magnificence. It is happy in the wholesomeness of its climate, in the profession of the Christian religion, the strength of its fortresses, the nature of its situation, the honour of its citizens, the chastity of its matrons, and even in the sports and pastimes there used, and the number of illustrious persons that inhabit it. On the East stands the Palatine Tower, a fortress both large and strong, the walls and body of which are erected upon deep foundations, and built with a cement tempered with the blood of beasts. On the west are two castles, well fortified (Baynard's Castle and Castle of Montfichet), and the City wall is both high and thick, with seven double gates, and many towers or turrets on the north side thereof, placed at proper distances. London once had its walls and towers in like manner on the south; but that vast river, the Thames, which abounds in fish, enjoys the benefit of tides, and washes the City on this side, hath in a long tract of time totally subverted and carried away the walls in this part. On the west again and on the bank of the river, the Royal palace exalts its head and stretches wide, an incomparable structure, furnished with bastions and a breast-work, at the distance of two miles from the City, but united to it, as it were, by a populous suburb. Adjoining to the buildings all round lie the gardens of those citizens who dwell in the suburbs, which are well furnished with trees, are spacious and beautiful. On the north are cornfields, pastures, and delightful

meadows, intermingled with pleasant streams, on which stands many a mill whose clack is so grateful to the ear. Beyond them an immense forest extends itself, beautiful with woods and groves, and full of the lairs and coverts of beasts and game, stags, bucks, bears, and wild bulls. This city, on the whole, is doubtless most charming, at least when it has the happiness of being well governed. In respect of the inhabitants, the City may be proud of its inmates, who are well furnished with arms, and are numerous. In the time of the late war, when King Stephen directed a muster, it turned out of effective men no less than 20,000 horse, properly accoutred, and 60,000 foot. The citizens of London everywhere and throughout the whole kingdom are esteemed the politest of all others in their manners, their dress, and the elegance and splendour of their tables; inasmuch that while the inhabitants of other cities are styled citizens, they are dignified with the name of barons, and with them an oath is the end of all strife. The matrons of the City are perfect Sabines. The three principal churches in London are privileged by grant and ancient usage with schools, and they are all very flourishing. The followers of the several trades, the vendors of various commodities, and the labourers of every kind are daily to be found in their proper and distinct places, according to their employments; and, moreover, on the bank of the river, besides the wine sold in ships and vaults, there is a public eating-house or cook's-shop. Here, according to the season, you may find victuals of all kinds, roasted, baked, fried, or boiled. Fish, large and small, with coarse viands for the poorer sort, and more delicate ones for the rich, such as venison, fowls, and small birds. There is also without one of the City gates, and even in the very suburbs, a certain plain field, such both in reality and name (Smithfield, or smooth field, as it was anciently called); here every Friday, unless it should happen to be one of the more solemn festivals, there is a celebrated rendezvous of fine horses brought thither to be sold. Thither come, either to look or to buy, a great number of persons resident in the City, earls, barons, knights, and a swarm of citizens."

Fitz Stephen then describes the various diversions of the citizens, such as horse-racing, foot-ball, mystery plays, tilting on horseback, also in boats on the river, archery, boar-hunting, sliding and skating on the ice, all exceedingly well pictured, and worthy of perusal, but too lengthy for me to recite to you on this occasion. Fitz Stephen adds, "To this city merchants repair from every nation in the world, bringing their commodities by sea.

"Arabia's gold, Baboea's spice and incense,
Scythia's keen weapons, and the oil of palms
From Babylon's deep soil, Nile's precious gems,
China's bright shining silks, and Gallic wines,
Norway's warm peltry, and the Russian sables,
All here abound."

This was London in the twelfth century, a hundred years after the Conquest. It grew and flourished, and, in spite of wars and difficulties of various kinds, it became renowned among the cities of Europe for the importance of its trade, the wealth of its citizens, and the beauty of its buildings.

Thus far we are obliged to depend on written description; there is no known plan or reliable view of London earlier than the 16th century. There are, indeed, fanciful pictures given in an early manuscript of the venerable Bede (see the fac-simile copy), but nothing founded on actual survey.

Now, however, I shall refer to my illustrations, and hope to give you a fair idea of the ancient City such as it was in the time of our Tudor sovereigns and of their successors, the Stuarts.

I shall first refer you to a very interesting view of London, copied from a remarkable drawing by an artist named Van den Wayngerde, which is now in the Bodleian Library, Oxford. It is one of a series of views of cities and interesting places supposed to have been done for Philip the Second of Spain, about 1640. It embraces

at the extreme east, a view of the palace of Placentia, near Greenwich, a favourite royal residence of King Henry the Eighth, Queen Mary, and Queen Elizabeth, and gives every building of importance up to the extreme west, including the palaces of Whitehall and Westminster. Next is the map of Ralph Aggas, the earliest plan known to exist of the City of London. It was published about 1663, though supposed to have been surveyed much earlier, and it corroborates in every material point the view drawn by Van den Wyngaerde. After that is a view by Viasscher, published in 1615, also giving very interesting views of all the principal buildings.

Then the fine view drawn and engraved by Hollar, similar to the last, and published in 1649. And next is a good clear map by Newcome, well engraved by Faithorne, about 1645, interesting as showing the growth of the City since the time of the Aggas map; and following these are various maps and views of places, to some of which I shall refer in the course of my description. On a map of London as it is at the present day I have indicated by colour the line of the Roman walls, and also the extent of the City in the sixteenth and seventeenth centuries.

With the assistance of the maps and views, now let me attempt to picture to you the old City. We will imagine a traveller journeying from Oxford, to approach the City by the road which is now Oxford-street, then called the way to Tyburn. All is country till he approaches the village of St. Giles. The first object he meets is the gallows; on his right are the hospital and church of St. Giles, and a few scattered houses forming the village; and running southwards is a lane leading by St. Martin's to Westminster. He passes by the road called Holborne (after a brook, the "Old bourne"). He is quite in the country, surrounded by hedgerows, though there is here and there a house; he sees on his right a lane, leading to Drury House, lately built; soon he enters the suburb, houses begin to line the way, he passes a bye-road, sparsely built upon, called Chauncery Lane, and on his left is Gray's Inn Lane, leading to fields. He reaches the Holborn Barres, and soon arrives at the brow of the hill, from whence the splendid prospect of the City bursts upon his view. On the right is the Church of St. Andrew, rising picturesquely from the steep declivity, surrounded by trees; on his left are the extensive buildings of Ely House, its great gateway, embattled walls, and lofty chapel, surrounded by pleasant gardens, forming a grand palace for its bishop; on the summit of the opposite hill is the church of St. Sepulchre's, with its lofty tower. In the same line, and over the embattled parapets of the Newgate, he sees the noble church and monastic buildings lately belonging to the Grey Friars, but now to be called Christ Hospital, and above all appears the great cathedral of St. Paul, whose gigantic spire, 520 feet high, rises majestically above its church, the church itself, nearly 700 feet in length, towering majestically with its roofs and pinnacled buttresses high above the mass of gabled houses and numerous churches stretching far beyond. Then he descends the hill, and, crossing the Holborn bridge over the river Fleet, he commences the ascent of Snore Hill opposite, and by Cock Lane he reaches Smithfield, or the "smooth field," "The old town green," from the Conqueror's time downwards, where the Londoners had their favourite games, their tournaments, their horse races; and, sad contrast! where hundreds of poor victims were sacrificed in the name of religion by burning and other dreadful deaths.

Here stood the Priory of St. Bartholomew, founded by the poor jester Rahere, of which the church still remains, further northward is the great Carthusian Convent, founded by Sir Walter de Manny, and afterwards known as the Charter House when converted into a refuge for decayed gentlemen and a renowned school by Sir Thomas Sutton, of whom some poor scholar said—

"Blessed be the memory
Of good old Thomas Sutton,

Who gave us lodging, learning,
And who gave us beef and mutton."

He was a worthy man, whose prayer should be remembered:—"Lord, thou hast given me a large and liberal estate, give me also an heart to make use thereof."

Beyond the Charterhouse to the north-west is the village of Clerkenwell, where is the great Priory of St. John of Jerusalem, surrounded by pleasant gardens.

Turning now eastward, our traveller passes into Aldersgate-street, on both sides whereof are divers fair houses, the residences of our chief nobility; here be Peter House, Thanet House, and the mansion of the Nevilles, Earls of Westmoreland, besides many fair inns of great resort. He enters within the walls of the City by Aldersgate, and passing where was recently the great sanctuary of St. Martin-le-Grand, he reaches one of the main avenues of the City, called Chepe, now Cheapside. The word Chepe is derived from the Saxon Chepe, a market; at this period it was the principal street of London, lined with picturesque gabled houses. Here were the shops of the chief goldsmiths, the mercers, the drapers, and others. In the words of Lydgate, written in the fifteenth century:—

"Then to Chepe, I gave drawne,
Where much people I saw for to stande,
One offered me velvet, silks, and lawce,
Another he toketh me by the hande,
Here is Paris threde, the finest in the lande."

In the centre of the Chepe, opposite Wood-street, stood one of the Crosses of Queen Eleanor, at the west end was placed the little Conduit, and at the east end, near the Poultry, was the great Conduit. The standard in Chepe stood near the Church of St. Mary-le-Bow, or St. Mary de Arcubus, from its being built on arches.

I refer you to an engraving of the "Entrance of Marie de Medici into London" for a curious view of Cheapside, showing very distinctly the whole line of the houses on the north side, as well as the Cross.

The print of the "Procession of Edward the Sixth from the Tower to Westminster," engraved from the fresco at Cowdray, is also interesting, but not exact.

Passing by the Poultry and the Stocks Market (the Covent Garden of that day), our traveller now reaches Cornhill, "so called," says Stow, "of a corn market time out of mind there holden."

Here at the west end Sir Thomas Gresham was then building his New Bourse or Exchange; toward the east stood another fair conduit; and here also was the Standard, with its four spouts of water running different ways; nor must we omit two fine churches, St. Peter's and St. Michael. Next, at the corner of Gracious or Grasschurch-street, stands the vast pile of building called Leadenhall; this was the ancient residence of the Nevilles, and was at that time used as a great storehouse for grain and wool, and for the trappings of the City pageants; beyond this is the church of St. Andrew Under-shaft, in front of which stood the lofty May-pole.

Returning southwards our traveller wends his way, through busy crowds, to East-chepe; this was a market in the old Saxon times, and was famous for its taverns even in those days; here was the Boar's Head of jolly Sir John Falstaff and Prince Hal.

Old Lydgate says of this street—

"There I hyed me into East Chepe,
One cryes 'rybbes of befe,' and many 'a pye,'
Pewter pottles they clattered on a heap,
There was harpe, pype, and minstrelaye."

We will leave our traveller here to refresh himself, while we turn our attention to the northern outskirts of the City.

A reference to the Aggas map will show that in the sixteenth century there was little building outside the walls of the City. From Aldersgate-street to Bishopsgate-street without there were fields and gardens, St. Giles' Cripplegate forms a little village, men are shooting in Finsbury-fields, the windmills beyond indicate the position of the present Windmill-street. From Bishopgate

the street to Shoreditch is lined with houses, on the left will be noticed Bedlam, to the right are the Spital fields, where men are practising archery. Houndsditch is veritably a ditch, with houses on its northern side only, to the west of it is the church of St. Botolph, Bishopsgate, to the east that of St. Botolph, Aldgate; the road to Whitechapel is lined with houses, and there are buildings in Hogges-lane, and a few in East Smithfield; the Hospital of St. Katherine forms a large enclosure, and is "pestered with small tenements," as Stowe says; then we arrive at the Tower. This fortress of our Norman kings is said to have been built upon the remains of the Roman *Arx Palatina*; the large quadrangular building, called the White Tower, was built, by command of William the Conqueror, by Gundulph.

Here many of our monarchs held their state or fled for safety. It was a fortress, a palace, and a prison, and many a one has passed a weary life within its walls, or left them to be seen no more.

In a volume of poems written by Charles Duke of Orleans, in the reign of Henry VI., and now in the British Museum, is a curious illustration showing the Tower of London, in which the duke was kept prisoner. I refer you to the fac-simile of this illustration, which, in a ubiquitous manner, shows the duke going to the fortress, writing his poems, looking out of window, and taking his departure. The drawing is very interesting, as giving the earliest known view of the Tower, with the bridge, and part of the City beyond. Returning to the Aggas map. Outside the Tower on the north is an extensive field in which women are engaged laying out linen, and on the west corner is the scaffold, which is also shown in Faithorne's map of about one hundred years after.

Now crossing the river we proceed across Horsey down to the Abbey of Bermondsey. This is well shown in the drawing. It was founded by Alwyn Childe, a London merchant, and was one of the most important priories in England.

Two of our Queens retired here to mourn, and here they died—Queen Catherine, wife of Henry V., and Elizabeth Woodville, Queen of Edward IV. On the suppression of the Abbey a house was built on its site in which the Earl of Sussex, in Elizabeth's time, lived and died; all is now cleared away, and the Church of St. Mary Magdalen marks the site of the old abbey.

We will now cross the meadows and proceed to the old High-street of Southwark. This has remained the great highway from the metropolis to the southern ports since the time of the Romans. Till within a few years many of the old inns remained such as they had existed for two or three hundred years, with their old courtyards surrounded by quaint outside galleries. One of these, now called the Talbot, is supposed to have been the old Tabard of the Canterbury pilgrims. How we may picture them as we read old Geoffrey Chaucer—

"It befell in that season on a day
At Southwark in the Tabard as I lay,
Ready to wenden on my pilgrimage
To Canterbury with devout courage,
At night was come unto that hostelry
Well nine and twenty in a company."

Here in this High-street let us picture one of the many pageants that have passed this way.

The hero of Agincourt returns to England after his great victory, where nine thousand half-starved English fought against eighty thousand French. The trumpeters lead the way, blowing loud ringing blasts, then the heralds in their rich tabards. The Lord Mayor and the aldermen, apparelled in scarlet, and four hundred of the Council clad in beautiful morrie, all well mounted, and trimlie housed, with rich collars and gold chains, all the guilds of merchants and great corporate bodies, the clergy of London, with rich processional crosses, sumptuous copes, and massive censers. The Royal standard borne aloft and the banners taken from the enemy. Then the heroes of the

fight clad in bright armour and brilliant surcoats, and lastly Harry the king, splendidly accoutred, young, brave, and handsome, and so modest withal, that he would not allow his officers to show in the procession, as they wished, his battered helmet, and his sword bent with the blows upon his enemies. Add to this the magnificent following, and the welcoming shouts of thousands, and we shall not wonder that the old chroniclers speak admiringly of the glorious triumph given to Henry V. after the battle of Agincourt.

Now let us return to our maps and views. In the drawing of Van Wayngerde you will notice a palatial building on the east side of the High-street; that is Suffolk House, the residence of the Charles Brandon, Duke of Suffolk, who married the Queen Dowager of France, sister of King Henry the Eighth. Opposite is the Church of St. George, and further on near the bridge is the grand Church of St. Saviour's, or St. Mary Overie. A monastery was founded here in very early times, and the present church was rebuilt in the fourteenth century. In this church lies buried the poet Gower, and here William Shakespeare buried his brother Edmund, "a player."

Now, turning westward near the river, we find a high-roofed hall; that is Winchester House, once the residence of the Bishops of Winchester, now the vinegar yard of Mr. Potts. Then in Vischer's fine view you will see the Globe, the Bear-garden, and the Swan. The first of them is the theatre where the wondrous plays of Shakespeare were acted; rude-looking structures they are, only partly roofed, and it is difficult to imagine how room was found to represent the plays and hold an audience. In the days of good Queen Beas, I fear that bear-baiting was a more attractive amusement than the drama.

Now, again, we will turn to Van Wayngerde's drawing, to notice his beautiful view of Old London Bridge. A most picturesque object it is. A bridge constructed of wood existed here in very early times, but being burnt, it was resolved in 1173 to build it in stone—a work which it took 33 years to accomplish. The architect was Peter of Colechurch. In the sixteenth century the bridge was crowded with buildings, leaving a narrow street in the centre.

Approaching from Southwark we pass under the Castellated Gate Tower, surmounted by human heads stuck on poles. Then we see a singular building called Nonsuch House, formed of wood much ornamented. In the centre of the bridge, the Chapel of St. Thomas, a picturesque structure, projects on one of the great Sterlings. The whole roadway of the bridge is lined with shops. In one of these, in the sixteenth century, lived a wealthy clothworker, named William Hewet. He had an only daughter, who one day slipping from the arms of her nurse, fell into the surging river. An apprentice of the clothworker, named Osborn, saw the child fall, jumped into the river, and was fortunate enough to save her. You may imagine what followed in after-time. The worthy clothworker was grateful, the daughter was handsome, and so was her dowry. Young Osborn married her, was afterwards Lord Mayor, and the descendants of the apprentice and the daughter of the clothworker became Dukes of Leeds.

Looking eastwards from the bridge, we notice Billingsgate, a small harbour surrounded by gabled houses and an octagon tower. Then a little further on is the Custom House, with, apparently, a very limited business. Then there is the Tower.

Now, I propose to take boat at the foot of the bridge, and by water to view the pleasant palaces, and castles, and convents, which in those days adorned the banks of Father Thames. Many of these were surrounded by pleasant gardens, whose trees were reflected in the clear flowing stream, which was crowded with wherries and pleasure-barges, trimmed with gay coverings—for the river in those days was the great highway between the City and Westminster.

Hither passed the royal barges, with banners spread aloft, and here also the Lord Mayor and great City companies went in procession in their state barges, a glorious spectacle, which was shadowed even in our own days, until a too close economy caused these state barges to be sold, and thus we lost the most picturesque pageant which remained to us.

I will take as my principal guide the view by Viisscher, and to render this more intelligible, I have, with the aid of my son, prepared a drawing on a larger scale, which shows more clearly the various buildings I shall allude to.

The first building of importance past the bridge is Fishmongers' Hall; then we see a large structure called Cole-harbour, a corruption of Coln or Cologne harbour, belonging to the Rhenish merchants, and the site of Poulteney Inn, once the residence of the great Duke of Exeter. Next is the Steleyard, or Sale-ale, an exchange for German merchants. Then, passing Dowgate, the Three Cranes, Queenhithe, and other wharfs, we come to Baynard's Castle; this was originally a Norman fortress, often used as a royal residence, and it was here that Richard III. had himself crowned. Then we pass the great monastery of the Blackfriars, and on the other side of the Flate-ditch is Bridewell, at that time a royal palace of great extent; here King Henry VIII. resided with Queen Katherine, pending the trial of divorce. Next is Dorset House, the residence of the Earls of Dorset; and in the garden of this house, nigh the river, was built, in 1670, the Duke's Theatre. Adjoining is the sanctuary of Whitefriars, the Alsatia so well described in the "Fortunes of Nigel;" the hall of the convent was made into the Whitefriars Theatre.

Now we arrive at the Temple buildings, then as now pleasantly situated in a garden; as Spenser says:—

"Those brick towers
The which on Thames' broad aged bank doe ride,
Where now the studious lawyers have their bowers."

Then we see Essex House, where Queen Elizabeth's favourite resided, and from whence he attempted the rebellion which cost him his life. Passing Arundel House, we reach Somerset House, the palace designed by John of Padua for the Protector Somerset, built on the site of the Bishop of Worcester's and other houses; it could have been scarcely completed before he lost his head. King Edward gave this palace to the princess Elizabeth, and Queen Anne of Denmark also resided here.

The next palace is that of the Savoy, the residence of the great Plantagenet Dukes of Lancaster; here the poet Chaucer lived, and was married, and wrote his poems. The mob under Wat Tyler having a special hatred to John of Gaunt, despoiled and burnt it; being rebuilt, it, in later times, became a prison; some parts of it still remain. Then we pass Worcester House, now Beaumont-buildings, and Salisbury-house, now Cecil-street.

The next palace has a special interest for us; it is Durham House, once the residence of the bishops of that see, and afterwards of the ambitious Dudley, Earl of Northumberland.

Few of you probably remember that the house of this Society stands on the grounds, if not on the site, of old Durham House, where poor Lady Jane Grey was married to Lord Guildford Dudley, where she lived, and from whence in a few short months she was taken to the Tower, there soon to lose her head, poor lady! Afterwards, Sir Walter Raleigh resided here, by grant of Queen Elizabeth. Aubrey mentions a turret overlooking the Thames in which Raleigh loved to sit and write. Then it came into possession of Robert, Earl of Salisbury, who took down the stables next the Strand, and built there a new exchange, called Britain's Bursae; and about 1770, the brothers Adam (the Adelphi) built the terrace, and the house of this Society was completed in 1774.

Now we pass on to York House, formerly belonging to the Bishops of Norwich, afterwards to the Arch-

bishops of York; then to Sir Nicholas Bacon, and lastly, in the time of James the First, to George Villiers, Duke of Buckingham, whose possession is recorded in George-street, Villiers-street, Duke-street, Of-alley, and Buckingham-street. All that remains is the beautiful water gate of Inigo Jones.

Next is Northumberland House and garden, on the site of what was once the Abbey of St. Mary of Roncesvalles. It was once called Suffolk House, and came to the Northumberland family by marriage.

We pass Scotland-yard, where was formerly a palace of the Kings of Scotland, and then we arrive at the palace of Whitehall. Anciently the residence of the Archbishops of York, it was rebuilt and splendidly furnished by Cardinal Wolsey, and from him it came to King Henry the Eighth, who made it his royal palace, henceforth to be called Whitehall. It continued to be the residence of our sovereigns till 1688, and was destroyed by fire in 1687.

The engraved plan of Whitehall Palace will be found interesting.

Having at last reached the Palace of Westminster, we will land at the Stayres and enter Palace-yard by an arched gateway. Here was a tower of stone, containing a clock with a great bell. Whether this is the one alluded to by old Stowe, which "sowered all the drinke in the towne," I do not know. Near this also stood a fountain which at coronations and great triumphs was made to run with wine out of divers spouts. In the court now called New Palace Yard, the wool staple was held.

I will not attempt a description of the palace or the abbey adjoining, but refer you to the illustrations. The chapel of Henry the Seventh was then in its full beauty, and the towers and other parts of the abbey had not been contaminated (I grieve to use this word) by Sir Christopher Wren.

We will pass under the gates of Holbein, up King-street to the Tilt-yard, the site of the present Horse Guards. On the left is the Cockpit, on which now stands the Treasury. Then we proceed to Charing Cross, where stood the most beautiful of the crosses erected to Queen Eleanor.

Before us we see the Royal Mews, where were kept the hawks of the King. It was afterwards adapted for stabling, and the word mews has since been transferred accordingly.

Looking again northward and westward, we are now again in the country, even up to the period of Faithorne's map. We turn to the left and pass up an avenue called Pall-mall to St. James's Palace. The name of Pall-mall is derived from a game played with wooden mallets and balls, greatly resembling our modern game of croquet. Turning again we see a country lane, called the Hay-market; and continuing our route, we reach a building called the gaming house, and opposite to it is a road running westward, described as "from Knightsbridge unto Pikadilly Hall," and in the Aggas map called "the way to Reddinge." Proceeding, according to this latter map, across fields where women are laying out linen to bleach, we reach the long acre field, and see the convent garden, enclosed by walls extending from St. Martin's-lane to Drury-lane. Referring, however, to the Faithorne map, we find this space now covered with houses, except a small area, called the Piazza, but which is now Covent Garden. Adjoining is Bedford House and garden, built by the Earl of Bedford, on the remains of the old monastery.

Now we enter the Strand, the high road between the City and Westminster.

On the south side are the various mansions of the nobility bordering the Thames. On the north side there are yet but few houses, as will be seen by referring to the Aggas map.

Opposite the Savoy is the mansion of Lord Burleigh, afterwards called Exeter House, and in after years turned into Exeter Change, a kind of bazaar below, and a menagerie on the first floor. We pass Wych-street,

formerly Ald-wyche, meaning "old farm," where is Drury House, and we reach the block of houses called Butchers'-row, frequented originally by free-trade butchers, in opposition to the City protectionists—a mass of tumble-down houses with projecting fronts, long since removed.

We next come to Temple-bar—not a gateway, but a bar, made to rise and fall, marking the entrance to the City boundary. Beside it is the "Devil Tavern," in which Will Shakespeare and his friend Ben Jonson often caroused.

Entering Fleet-street, the houses are more closely built, their gabled fronts, mounted with carved barge boarding and timber framing, present a varied and picturesque effect. On the left is Chancery-lane, where the Archway of Sir Thomas Lovel had been recently erected, forming an entrance to the Lincoln's Inn, on the site of an old monastery of Blackfriars.

On the south side of Fleet-street lies the Temple, with its ancient church. At the end of Shoe-lane stands the Conduit, erected about 1478, with the figures of angels; and before each are bells, on which are struck by machinery the hours of the day and night. On the right, further on, is the Church of St. Bridget, now called St. Bride's; we cross a bridge over the Fleet River, and pass the great palace of Bridewell. Then, mounting the hill, we enter the City beneath the arch of Lud-gate, and behold again, in all its grandeur, the Cathedral of St. Paul. At the north-western corner is the famous Paul's Cross, whence the most celebrated preachers were accustomed to address the citizens, and where fair ladies sometimes did penance. Thus old Hollinshed tells us of Jane Shore:—"Here, in her penance, she went, in countenance and pace demure, so womanlie, that albeit she were out of all araise, save her kirtle onlie, yet went she so faire and lovelie, that manie good folke that hated her living, yet pitied they more her penance than rejoiced therein, when they considered that the Protector procured it more for corrupt intent than any virtuous affection." The cross was pulled down by order of Parliament in 1643. The engraved view gives a good idea of the place.

The Church of St. Paul was probably the largest in Europe, the spire was quite the highest, but was destroyed by fire in 1661. At this time the old church had been much injured, parts were in bad condition, and parts much abused by throngs of idlers, nevertheless it had glorious reliques; there was a fine tomb of William Bishop of London, in the Conqueror's time, another of John of Gaunt and his wife Blanche of Castille, and the altars still glittered with gold and precious stones; on the southern side was a cloister in which was depicted the "Dance of Death."

Our old dramatists drew many of their characters from Old St. Paul's; here Shakespeare found *Pistol* and *Bar-dolph*; here Jonson met *Bobadil*, "a Paul's man," *Master Stephen*, and *Fastidious Briak*. But I must not detain you. Let us again look into Chepe. It is Midsummer-Eve, the picturesque perspective of gabled houses, the sculptured cross, and the fountains are dimly shadowed in the twilight. The galleries of the houses and the windows are filled with groups of figures gaily dressed. Presently is heard the sound of trumpets, and a vast flood of light is seen approaching, it is the Festival of the Marching Watch. Onward comes the vast procession, 700 men bearing cressets, and with each a man also to serve it, besides which are 250 constables each with his cresset, about 1,000 cressets in all. Mingled with these come 2,000 of the marching watch, some on horseback, some on foot; demi-lances on great horses, gunners with their harquebusses and wheel-locks, archers in white coats, with bows bent and sheafs of arrows by their side; pikemen in bright corsets, and billmen with aprons of mail; following these came the constables of the watch, each in bright harness flaming from beneath his scarlet jor-net, and with golden chains. Then came the waits of

the City, and morris dancers footing it to their merry notes, and then the Mayor himself on horseback, his sword-bearer, his henchman, his harnessed footmen, his giants and his pageants; then the sheriffs in like order: onwards sweeps the mighty cavalcade amidst the assembled multitude lining the broad avenue of the Chepe: and so has passed one of the most picturesque pageants of the olden time.

Thus I have endeavoured to picture to you old London as it existed in the 16th and early part of the 17th centuries.

Sad changes were soon to come upon the old City. Firstly, the great plague, which in 1665 carried off about 70,000 victims, about one-fourth of the whole population; grass grew in the streets, which became silent and deserted; and in 1666 occurred that awful calamity the fire, which almost entirely destroyed the City. Evelyn, in his diary, gives a trustworthy account of it, from which I will read an extract:—

"Sept. 2nd.—This fatal night, about ten, began the deplorable fire neere Fish-street in London.

"Sept. 3rd.—I had public prayers at home. The fire continuing after dinner, I took coach with my wife and sonn and went to the bank side in Southwark, where we beheld that dismal spectacle, the whole City in dreadful flames neare the water-side; all the houses from the bridge, all Thames-street, and upwards towards Cheapside, down to the Three Cranes, were now consumed; and so returned exceeding astonished what would become of the rest. The fire having continued all this night (if I may call that night, which was as light as day for ten miles about, after a dreadful manner) when conspiring with a fierce eastern wind in a very dry season, I went on foot to the same place, and saw ye whole south part of ye city burning from Cheapside to ye Thames, and all a long Cornhill (for it likewise kindled back against ye wind as well as forwarde) Tower-streets, Fenchurch-streets, Gracious-streets, and so along to Bainsard's Castle, and was now taking hold of St. Paul's Church, to which the scaffolds contributed exceedingly. The conflagration was so universal, and the people so astonished, that from the beginning, I know not by what despondency or fate, they hardly stirred to quench it, so that there was nothing heard or seene but crying out and lamentation, running about like distracted creatures, without at all attempting to save even their goods, such a strange consternation there was upon them; so as it burned both in breadth and length the churches, public halls, exchange, hospitals, monuments, and ornaments, leaping after a prodigious manner from house to house, and streets to streets, at greates distances one from ye other; for ye heate with a long set of faire and warme weather, had even ignited the air, and prepared the materials to conceive the fire, which devour'd after an incredible manner houses, furniture, and everything. Here we saw the Thames covered with goods floating, all the barges and botes laden with what some had time and courage to save, as, on ye other ye carts, &c. carrying out to the fields, which for many miles were strew'd with moveables of all sorts, and tents erecting to shelter both people and what goods they could get away. Oh the miserable and calamitous spectacle! such as happily the world had not seene the like since the foundation of it, nor be outdone till the universal conflagration of it; all the skie was of a fiery aspect, like the top of a burning oven, and the light seene above 40 miles round about for many nights. God grant mine eyes may never behold the like, who now saw above 10,000 houses all in one flame; the noise and cracking and thunder of the impetuous flames, ye shrieking of women and children, the hurry of people, the fall of towers, houses, and churches, was like an hideous storme, and the aire all about so hot and inflamed that at the last one was not able to approach it, so that they were forc'd to stand still and let ye flames burn on, which they did for neere two miles in length and out in bredth. The clouds also

of smoke were dismal and reach'd upon computation near 50 miles in length. London was, but is no more!

"Sept. 4th. The burning still rages, and it was now gotten as far as the Inner Temple; all Fleet-street, the Old Bailey, Ludgate Hill, Warwick Lane, Newgate, Pauls Chaine, Watling-street, now flaming, and most of it reduc'd to ashes; the stones of Pauls flew like granados, ye mealting lead running down the streets in a streame, and the very pavements glowing with fiery rednesse, so as no horse nor man was able to tread on them, and the demolition had stopp'd all the passages, so that no help could be applied. The eastern wind still more impetuously driving the flames forward. Nothing but ye almighty power of God was able to stop them, for vain was ye help of man."

400 streets, 89 churches, 13,200 dwelling-houses, all the old conventional buildings and castles, most of the city halls, and the great cathedral, all were consumed by this dreadful conflagration.

This was the end of old London.

DISCUSSION.

Mr. G. C. T. BARTLEY suggested that the great labour bestowed upon this interesting subject by Mr. Crace, and by his father before him, and the vast amount of information collected by them, might be rendered still further interesting to the present generation of inhabitants of London by tablets being placed in such localities as were remarkable as the sites of famous buildings or historical events, or were noted as the residences of great men of past ages. Such tablets, he suggested, might indicate briefly the points of interest. The same remarks applied to events of more recent date than those treated of in the paper. The City of London, he observed, abounded in objects of antiquarian and historical interest, and every wayfarer travelling on foot or driving through the metropolis would be enabled, by the means he proposed, to read the history of olden times with interest and instruction. This plan had been adopted to a considerable extent in many of the towns of the Continent; in Boulogne, for instance, might be seen a tablet indicating the residence of the author of *Gil Blas*. To do this in London would of course be a work of time, but when accomplished it would be a source of gratification to those who engaged in it. The Society of Arts, he was happy to say, had taken this work into their consideration, and a committee of the Society was now engaged upon it; and he hoped that shortly a commencement would be made.

Mr. BISHOP said he believed the original name of London signified a town on a lake. At the period when that name was used, the south side of the Thames was under water every tide, forming a lake.

Mr. CRACE remarked that there were no fewer than forty-eight different names, with their derivations, given in the various works on ancient London; and as they were so numerous, and in some cases so very imaginative, he thought on the whole it was better to abstain from giving any of those appellations.

Mr. J. M. DRACH said the original London Stone was now in Pannier-alley, and marked the highest spot in London.

Mr. BLACK said there was no doubt the old London Stone had been removed from the spot where it originally stood, according to the survey of London made after the great fire of 1666. With regard to its being of smaller size than the original, he believed there was but little, if any, difference. He was inclined to the belief that instead of being a point from which distances were measured, it was rather a geometrical point of the Roman surveyors, and that it was never regarded as a mile-stone at all. He thought Mr. Crace was under the impression that the portion of the City called Newgate was so recent that he did not take his traveller into London that way; but when Skinner-street was blocked up, all who wished to enter that portion of London did so by a very old thoroughfare, passing over the Fleet to the north-west

part of Smithfield. From that point the ancient traveller went down Holborn-hill and traversed London from west to east, entering by Chamberlain-gate, since called Newgate. It was one of the most ancient gates of London, and the present Newgate-street, though greatly altered, was the old Roman street leading from that gate.

Mr. W. BOTLY had been struck with the remarks in the paper with regard to the conduits of old London. It was probable that those conduits had some architectural pretensions; but if they had waited for such conduits to be placed in the spots now marked by the existing humbler drinking-fountains, a great benefit would have been lost to the present generation of inhabitants of London. He would give all thanks to those benevolent individuals who had done so much for the sanitary improvement of London, by establishing the present drinking-fountains, which, for his part, he should like to see more numerous. He hoped Mr. Crace's remarks on that subject would not throw a damp upon those persons who were inclined to further that work, and add to the water supply of the City. He had seen thousands drinking of those waters, and at the time of the cholera epidemic the numerous drinking fountains yielding fresh and good water were amongst the best promoters of health that existed. He hoped the number of those conduits would be multiplied all over London, and in his opinion they contributed, as far as they went, to the ornamentation of the streets.

Mr. R. RAWLINSON, C.B., would point out to all persons desirous of studying what ancient London was, that besides the maps and illustrations on the walls, and the information given by Mr. Crace in his most interesting paper, they could get an excellent idea of ancient London, and a clear insight into the comforts and miseries of its inhabitants of those days, by visiting many of the continental cities of the present day. In Copenhagen, in Constantinople, and other cities, might be seen the types of ancient London at various periods. Within the last 200 years in this country there had been rapid advances in civilisation. London at the present time, with its huge aggregation of buildings, was regarded as the healthiest great city in the world. In former periods it was well known that not only London but most other ancient cities were the reverse of healthy; and if, with the beautiful description of ancient London they had listened to, the student wished to have a correct understanding of the state of things at the period referred to, he would ask him to pay a visit to Constantinople, which, he believed, at the present time, gave a very fair specimen of what the London of the time of Charles the First might be supposed to have been—narrow, intricate streets, no sewerage, no public lighting, no scavengering—all the refuse thrown from the court-yards into the streets—the dogs the only scavengers, the rain the only cleanser—the pavement of the roughest description, consisting of boulders two or three feet across, interspersed with stones not larger than the hand. The wonder was that horses could pass over such a surface at all, whilst wheeled vehicles were certainly out of the question as a means of locomotion. To understand what old London was at various periods, he would ask them to visit some of the cities of northern Europe. Copenhagen might be given as illustrating one period, Stockholm another period, and some of the Russian cities another period, and they might gather from those what this country was 300, 500, and even 1,000 years back. With all this picturesque description of ancient London they had heard, it appeared that the main thoroughfares were almost impassable for mud. Going back only to the time of the *Spectator*, and even later, they found the old watchmen in existence; mohawks prowled about the streets at night unmolested, and life had very little value and less protection. He therefore thought the glowing descriptions given by early writers must be taken with a good many grains of salt. He should like to hear a description of the progress made since the period treated of in the paper. There was a gentleman

in the room (Mr. Haywood) who, he hoped, would, on some occasion, give them a description of what modern London had become under his superintendence. Nothing could be more interesting than a history of the material progress of the great metropolis. He would say one word on the subject of drinking fountains. He disagreed with Mr. Crace on that point, and he sincerely hoped that gentleman's suggestions would never be carried out. Fountains, on the scale Mr. Crace suggested, however ornamental, would be to him (Mr. Rawlinson) an eyesore and a nuisance, so long as they did not contribute to the material benefit of the inhabitants of this great city. The humble drinking fountain, with its single water dish, where the wayfarer could take his drink, was, in his opinion, incomparably better than the Trafalgar-square squirts, which served no purpose but to wet the pavement on windy days, and become receptacles for all kinds of rubbish. Mr. Crace probably had not studied the sanitary part of the question so much as he (Mr. Rawlinson) had been obliged to do. His opinion with regard to baths and wash-houses, as well as fountains and all similar matters, was, that money ought not to be thrown away in buildings of a magnificent character. Many failures of baths and wash-houses had taken place from erecting stately buildings, to which the poor would not go, or from placing them in situations where they were not wanted. He would say, let such buildings be of the plainest and least expensive kind, but with the best appliances for the purposes they were intended, and let them be placed where they were needed, in the most crowded localities, and let them there be multiplied, as they might be at a twentieth part of the money which had been expended upon some of these buildings. He had listened with the greatest pleasure to Mr. Crace's interesting paper; he feared he (Mr. Rawlinson) had wandered somewhat from the subject, but he hoped he should be followed by others who would speak more to the point than he had done.

Mr. J. BRAYINGTON ATKINSON would allude to one or two points mentioned in the paper. One was as to the great elevation of the surface since the time of the Romans. They were told that Roman London was from 15 to 20 feet below the present surface. He believed that was the common experience of all ancient cities throughout the world. In Rome itself there was about the same rise of level as was the case in London. The ancient Roman Forum was 15 or 20 feet below the present surface. A similar rise of surface was found in modern Jerusalem. Ancient Jerusalem was from 10 to 40 feet below the modern level. This, he thought, was a general law, and might to some extent be accounted for by the simple fact that in all cities more material was brought into them than was taken out of them, and when buildings decayed or were destroyed the *debris* were not always removed. It occurred to him that the comparative antiquity of London was not so very remote. There was another point of great importance, on which he hoped the chairman would be induced to give the information which he was so thoroughly able to impart; that was in reference to the restoration of the Chapter-house of Westminster Abbey, now in progress. The researches of Mr. Gilbert Scott had resulted in the discovery not only of points in the architecture of that building which were not known before, but also of paintings of rare beauty, rivalling that of the early Italian school. The work of restoration of those paintings, he feared, would be one of great difficulty. In some cases whole panels were so obliterated that restoration was out of the question. As a lover of ancient art, he hoped to hear from the chairman that, as far as possible, these paintings would be restored and preserved as works of art of the most invaluable character.

Mr. G. B. GALLOWAY thought, however interesting the history of the past might be, practical minds would rather direct themselves to what might be done for the advancement of the present age—taking advantage of

past experience. He had hoped to have heard something respecting the noble design of Sir Christopher Wren, for the improvement of the City after the Great Fire; if that design had been carried out London would have been very different from what it now was. Interesting as it might be to record the sites of notable eminent buildings, and the residences of famous men of past ages, he thought it was more interesting to foster and develop the practical sciences of the day for the benefit of existing populations, than to talk of men who had passed away, and of things which had been.

Mr. P. PALMER thought they had talked more of what London ought to be than the subject of the paper, viz., what it was previous, and up to the 15th and 16th centuries. With reference to the comparison instituted by Mr. Rawlinson between the condition of ancient London and at the present period, he would remark that the highway alluded to as being in so deplorable a state of mud—viz., the Strand, from Temple Bar to Charing Cross—was not at that period the great highway of the citizens, inasmuch as the river was then the great highway. The times were changed now, and it was the Thames that now was open to reproach. They had not then the advantages of a Metropolitan Board of Works or City Commissioners of Sewers. At the same time they could hardly suppose that the citizens would walk the streets in silken doublet and hose, unless some regard had been paid to the cleansing of them. On particular occasions the streets were strewn with rushes, and every precaution was taken to enable the citizens to walk clean. With regard to the public conduits, he thought the purpose for which they were erected was misunderstood. In the absence of all other water supply to the City, it might be supposed that these conduits were the great magazines from which water was distributed to the inhabitants, and constituted a continuous water supply, a desideratum not accomplished in the present day. Mr. Crace had brought before them the fact that in the place of these noble conduits we had the little fancy fountains, which were placed in different parts of London, no doubt erected with very laudable intentions, though, so far as his (Mr. Palmer's) experience led him to believe, they were little used by the working men. On the subject of recording the sites of celebrated buildings and localities remarkable for historical events, or the residences of eminent men, as advocated by the first speaker, it occurred to him that the object would be much better attained by placing obelisks in certain quarters, on which could be inscribed the records of the neighbouring localities. Perhaps, better than all, the various vestry halls would be good places for such information to be recorded. The situations where the tablets would be erected were very often in retired back streets, little frequented by the public, and it was for this reason he advocated the erection of obelisks where the passer by would more readily take note of them.

Mr. ASH mentioned that twenty-five years ago he saw a fragment of the old Fleet-bridge which had been buried by the raising of the valley, and he suggested that a collection of such relics would be of great interest to antiquarians.

Mr. J. A. NICHOLAY said they had heard a good deal of ancient London; he would for a moment call attention to the London of the present day, and what it was likely to be in the future. He pointed with pride to colossal buildings in every direction, which vied with those of Paris or any other continental capital; to the vast scheme which had to a great extent been carried out for the drainage of London, and which had been executed on a scale calculated to meet the wants of generations yet to come; also to the great work of the embankment of the Thames now being prosecuted. All these, added to the other great public works now going on, were matters of which modern London might well be proud.

The CHAIRMAN said he had now to call the attention of the meeting to what was due from them to Mr. Crace,

and he was quite sure it needed no words from him to induce them to return their most hearty thanks to that gentleman for the comprehensive and extremely interesting paper he had favoured them with. The paper which Mr. Crace had written was a hasty but most masterly sketch of London through a period of almost 1,600 years, commencing, as it did, from about 60 years after Christ and extending down to the year 1866, where, as he said, Old London came to an end. To have drawn a sketch at once so vividly coloured, and so rapid, could only be possible to a man who had every fact ready to hand for use at a moment's notice, and that could only be the result of a life-long study of the subject. He did not say that Mr. Crace himself had devoted a life to it, but what he and his father had done together combined the work of a lifetime, and it was only by that means he had been able to lay this beautifully coloured and brilliant sketch before them, in which the whole history of London had passed before them throughout those sixteen centuries. Many of the pictures presented to them were most agreeable; and he had no doubt the agreeables and disagreeables were then, as compared with the present day, pretty equally balanced. They were always making improvements, but in some respects, as one of the speakers had said, they did not make the improvements they ought to do. He had no doubt the way by land from Westminster to London was more muddy in old times than it was now, but the old road—the Thames—was now a great deal more muddy than it was then; and he agreed with Mr. Nicholay it was a very great work which was being carried on by the Metropolitan Board of Works—the rendering old Father Thames again free from the muddy condition in which it was presented to them in the present day. Mr. Crace had rightly said that old London came to an end at the Great Fire of 1666. Happily, however, though it did in a certain sense come to an end, it left many interesting relics behind it. Time did not admit of Mr. Crace calling their attention to all the numerous relics of old London which still existed. Amongst these were some to which his attention had been more particularly called as an architect, and those he would briefly pass in review. Within the last few years some parts of the old Roman walls of London had been laid bare, and most interesting they were found to be; but, as he had not seen them himself, he would not speak further of them. Then they came to the Tower of London, built on the site of the ancient Roman citadel, and in itself containing probably the largest keep in Great Britain, built by the Conqueror himself and the great architect of the day, Bishop Gundulph. That keep, though much damaged by the enlargement of the windows and other alterations, was still most interesting, and still retained its beautiful chapel. A more perfect representation of a small and beautiful church of the early Norman period could scarcely be found anywhere. It had lately been partially restored, and was a perfect model of a church, on a minute scale, of that period. Then the Tower contained numerous other remains. The old gateways and numberless other portions were of the highest historical and antiquarian interest, many of them rendered sacred by inscriptions carved upon their walls by great and often good men immured within its dungeons. Then he would mention the remains of St. Bartholomew's Church, in Smithfield, the work of Rahere, the jester, its "first canon, and first prior." That church, he believed, was begun about the year 1107; the whole of the choir remained, and it was now undergoing restoration. He had no doubt a great many persons had lived in London for years without having seen this church. Some remains of the monastic buildings still existed, but he remembered the time when more of the ancient accompaniments of the church were standing (including the walls, to a certain height, of the chapter house), but they were destroyed by a fire among surrounding buildings in the year 1830, and the remains of

the cloister had been subsequently taken down. Not far from thence were the remains of the gateway of the old monastery of St. John of Jerusalem, the outline of which was familiar to them from its forming the embellishment of the cover of the *Gentleman's Magazine*. Then there was that most beautiful monument, the Temple Church, the round part of which he would say was one of the most beautiful remains of the period of Fitz Stephen, and of the great transition from Norman to Gothic architecture. The choir was a most beautiful remnant of fully developed early pointed architecture. The exterior had been recently brought out to view by Mr. St. Aubyn, the architect to the Inner Temple, and the north side was particularly interesting. The internal beauties of that church, as restored some years back, were probably known to most present. Then there was the old church of Austin Friars, which narrowly escaped destruction by fire, and had been recently restored. Then they came to old Ely Chapel—the chapel of the London palace of the old Bishops of Ely—a most beautiful chapel, though dreadfully mutilated, of the date of about 1290. Then there was St. Helen's Chapel, Bishopsgate, and a number of old churches not so famous for their architecture as for the monuments they contained, many of which, if not of high antiquity, were of great interest. Amongst the secular buildings, they had the great Guildhall, the roof of which, destroyed in the great fire, had been recently restored very much in its ancient form. Then there was the charming old hall of Sir John Crosby's house in Bishopsgate, a beautiful specimen of the architecture of the 15th century. There had been till recently the remains of Gerard's Hall, but they were destroyed, ruthlessly he was afraid, not many years ago. He would mention one interesting little piece of antiquity which he had accidentally met with. In the construction of the railway at Farringdon-street the excavation laid bare, on what seemed to be the site of one of the wharves on the Fleet, a kiln for burning the encaustic tiles which decorated the floors of ancient churches, and by the side of it was discovered a heap of spoil tiles just as they had been thrown aside and left there. They had no remnants remaining of old London Bridge, but many present no doubt remembered it well. He went over it at the time of its demolition to make room for the new bridge, and he made a sketch of a curious little chapel in one of the piers. Beyond the bridge they came to the noble Church of St. Mary Overy, better known as St. Saviour's, a most noble early English church on a grand scale. The Lady Chapel and the choir were carefully restored 30 odd years ago by the late Mr. Gwilt, who was most anxious to restore the nave also, but, unfortunately, the roof was a little decayed. The parish employed a surveyor, who cared nothing about antiquities. The roof was taken down, and the nave, after being exposed to the ravages of several winters, was ruthlessly swept away, and there was erected on its site—perhaps considering what it had supplanted—the most wretched structure that ever disgraced London. Then passing along the south side of the Thames they came to old Lambeth Palace, one of the most magnificent of the few remains of the many Episcopal palaces which existed all over the country in olden times. It retained its beautiful early English chapel and the hall of the fourteenth century, besides many other highly interesting portions. Last of all, though not exhausting the list, he came to Westminster Abbey, than which a more glorious monument of the architecture of the middle ages could not possibly be found. Externally, as they were aware, this structure had been very much damaged by decay and repARATION. It had been refaced and restored till almost every vestige of the ancient work was gone; but internally it challenged for beauty every church he had ever seen in Europe. Looking at it from an antiquarian point of view, it contained considerable remains of the church and monastic buildings built in the late years of Edward the Confessor. Within the last few months

there had been discovered, while removing portions of the pavement, the bases of several pillars of the Confessor's Church; and extensive remains of the same age existed in many of the other buildings of the Abbey. Then, again, they had considerable remains in the Norman chapel of St. Catherine, and the church itself was the most glorious specimen of the most highly developed architecture of the thirteenth century to be found in this country. One of the speakers had called attention to the Chapter House, the interior of which had, until lately, been almost hidden, but was now more thrown open to view, and an inquiry was made respecting the paintings there. He (the Chairman) would say, that in his opinion these paintings ought not to be touched with any idea of attempting to restore them, and, if their decayed state detracted from the artistic effect of the building when restored, the fact that what remained was authentic and untouched would amply compensate for any loss of that kind. With regard to the interior of the Chapter House, he thought there was but little wanting really to enable them to restore it perfectly to its old form. He did not mean by *restoring* the scraping it over and making it look new; all he should do was to restore those parts which had been ruthlessly destroyed, or from other causes lost. Everything now in its place he would leave untouched. Externally the same rule could not be applied, for it had utterly perished, and there was hardly a piece the size of his hand which retained its ancient form; therefore, they must make the exterior practically a new building. Internally, he hoped a large proportion would be the true Chapter House which was erected by Henry III., in 1558. Westminster Hall might be mentioned as one of the most magnificent banqueting halls ever erected. It was first built by Rufus, and brought to its present state by Richard II. The Chapel of St. Stephen had, unfortunately, passed away. It was cased round with wainscoting when used as the House of Commons, and at that time they could see nothing of the internal architecture or decoration; but when this casing was swept away by the fire it seemed like a phoenix rising out of the ashes, for then its beauties came out most gloriously. Antiquaries present were aware that copies of the exquisite paintings which covered every part of its walls, made by John Carter some 60 or 70 years back, were published by the Society of Antiquaries. Those paintings came out to view after the fire, and were as clear as those around the room in which they were assembled. But in an evil day it was determined that that chapel should be taken down, though he and many others strongly protested against it. Happily the crypt beneath remained, and that had been very beautifully decorated by Mr. Crace under Mr. Barry, the architect. The only other antiquity of importance connected with the Palace of Westminster remaining, and which hundreds did not know was an antiquity at all, because it had been scraped and made to look new, was the beautiful cloister of Henry VII.'s time, which was the cloister of the canons of St. Stephen. It was a cloister of two storeys, and an apsidal chapel projected into the courtyard from the western side on each storey. He would allude once again to that great but lost structure of the middle ages, old St. Paul's. Those who were interested in that magnificent building would do well to consult the description given of it in Dugdale's book, as well as the numerous views of it such as those now exhibited by Mr. Crace. He believed he was correct in saying it was in its day the largest and loftiest cathedral in Europe. Its steeple overtopped those of Strasburg, Vienna, or Antwerp, and its beauty was proportioned to its magnificent extent. The nave and transept were early Norman, of the character of Durham, Ely, and Peterborough, and other great Norman cathedrals. Its choir was, in character and date, like that of Westminster Abbey, without its apsidal termination, and its eastern

On the whole, it was one of the proudest

monuments of mediæval art. There had arisen in place of it a magnificent building; but they could not but regret that they had lost so glorious a structure connecting them with bygone ages. The Chairman concluded by moving a vote of thanks to Mr. Crace for his able and interesting paper.

The vote of thanks having been passed,

Mr. CRACE expressed his acknowledgments for the kind manner in which his paper had been received by the meeting. To those gentlemen who had favoured him with observations upon it he would only say the paper was essentially one on old London. He had purposely abstained from making any comparisons. He meant to confine himself to old London, without referring in any way to Sir Christopher Wren, and his most desirable plan for the restoration of London. With regard to the observations of the gentleman who seemed to object to these retrospects of the past, he would say he thought there was a luxury in reflecting upon the monuments of the past, those connected with the past history of the City in which they dwelt. With regard to London Stone, it was not a milestone, but a milliare, a point from which all miles and distances were calculated; and it was placed in its present protected situation 200 years ago. It was no doubt much diminished in size since the time when Jack Straw put his sword upon it and said, "This is London Stone." All, he would add was, that if some one would be good enough to favour them with a paper on London in the time of the *Spectator*, it would form a continuation of a history which must always be interesting to them; and this might be followed by our bringing down to our own day the history of the great city in which we lived.

Proceedings of Institutions.

LANCASHIRE AND CHESHIRE UNION OF INSTITUTES.—*Rawtenstall Mechanics' Institute.*—The annual *soirée* of the Rawtenstall Mechanics' Institution was held on Saturday evening, Nov. 24th. R. H. Hardman, Esq., J.P., occupied the chair. The report stated that the present year commenced with a balance of £59 15s. 2d. due to the treasurer. The gentlemen of the neighbourhood, however, had contributed £94 2s. 6d. towards its liquidation. After the current expenses had been paid there would be a balance of £20 in favour of the Institution. The reading-room is supplied with seven daily papers and seven periodicals. The library consists of 1,440 volumes; 1,819 volumes had been circulated during the past year. Efforts are being made to secure the services of the organising master of the East Lancashire Union, with a view of greatly extending the operations of the evening classes. The results of the examinations in connection with the Union of Lancashire and Cheshire Institutes had been very satisfactory. After the report had been read Colonel Wilson Patten, M.P., delivered an address, and then distributed the prizes and certificates obtained by the successful candidates. Addresses were also delivered by J. Robinson Kny, Esq., J.P., Thomas Lawton, Esq., visiting agent of the Lancashire and Cheshire Union of Institutes, J. B. Whitehead, Esq., J.P., Mr. Alderman R. H. Hutchinson, Captain Aitken, &c.

MARLBOROUGH READING AND MUTUAL IMPROVEMENT SOCIETY.—A dramatic recital of comic chapters from Dickens's "Barnaby Rudge" was given recently by Mr. Walter Rowton, of London, in connection with the above society, in the Town-hall.

DEODORISING INDIA-RUBBER.

The extremely disagreeable odour attaching to india-rubber manufactures, and the power possessed by them of imparting a nauseous taste

stances, has long been a difficulty in the way of its use for many purposes for which india-rubber is peculiarly adapted. To obviate this evil many expedients have been resorted to, but none hitherto with perfect success, and this on account of the strong tendency which india-rubber has to acquire and retain odours. The new process invented by Mr. S. Bourne depends upon the still greater affinity possessed by charcoal, especially animal charcoal, for all kinds of odours, and its great capacity for the absorption of gases. The practical difficulty lies in so using the charcoal as not to injuriously affect the articles with which it may be brought in contact, and this has now been overcome by very simple means.

The mode of application necessarily varies according to the description of articles which are thus treated. Generally speaking, they are laid in shelves or trays in a hot chamber, with a thin stratum of charcoal beneath and on top, and exposed to a temperature of from 120 to 180 degrees for from three to six hours, after which they are removed from the charcoal, having sustained no other alteration than the all-important one of being rendered devoid of smell and incapable of imparting any taste to liquids or other substances they may touch. Under proper management the most delicate textures can be thus dealt with without being impaired either in substance or appearance. The most convenient mode of applying heat is by hot water or steam surrounding the vessel or chamber in which they are placed. One very considerable advantage of this process is that, for a large number of vulcanized articles it can be carried on in co-operation with the heating or curing by which the vulcanization is effected, and they leave the chamber at once free from odour. It is equally applicable to india-rubber in sheet, spread fabrics, or the garments and other articles made therefrom when fully made up, such as the ordinary "macintosh" clothing, air and water cushions, &c. The use of this process enables the inventor to produce his "flexible diaphragms" (which were first brought before the public at the Dublin Exhibition, where they obtained a prize medal) in so pure a state that they may be at once used with the most delicate wines and other liquids. The diaphragm itself is a contrivance for the division of casks or other vessels into two separate chambers, by means of a flexible partition, which fits to the upper or lower part of the vessel alternately, or into any intermediate position, so that whatever the quantity of liquor contained within it, the air (though still exercising its pressure through the medium of the diaphragm) is separated from it by an impervious shield, and thus the injurious effects of exposure to atmospheric influence are altogether avoided, and any portion of the liquor may be withdrawn at pleasure, and as often as may be, without any admission of air to the remaining portion. In this way vessels of wine and beer are stated to have been actually kept in constant use for six and twelve months without any fermentation or formation of acid resulting. It is equally applicable to other liquids for domestic use or for medicinal or scientific purposes, the fluid remaining as completely secured as if the vessel were actually full.

An adjunct to this invention, and which permits also of independent use, is in the elastic valves, in two varieties—the one for giving vent to the products of fermentation, when desired, such as the carbonic acid gas generated by malt liquors, &c., the other for giving admission to air, so as to enable the liquid to flow through the tap or other orifice. In the one case a circular disc of vulcanized india-rubber is made to cover a small opening through which the gas is free to escape, but meets in its passage with the india-rubber, which being forcibly held down round its edge is at liberty to become distended, and in so distending opens a number of very minute holes which have been previously pierced throughout its surface. When the pressure is removed, the disc again becomes flat and its orifices shut. The degree of pressure before these perfora-

tions open is perfectly under control, and may be adjusted to any required degree.

In the other form a small cylinder of india-rubber, closed at its lower end, is drawn over a corresponding cylinder of wood with a hole through its centre, and then tightly bound at its upper edge. The india-rubber has a number of slits made in its substance, which (when any orifice through which the liquor may flow is opened) receives the pressure of the air, and yielding to this, open, so as to let the air enter the vessel to exactly the same extent as liquor is withdrawn. When the flow of liquor is stopped, the edges of the slits become drawn together, so as to prevent any escape of liquor or gas in a wrong direction. Should there be any pressure from within upon the surface of the india-rubber, this will only tend to the more perfect closing of the slits, and thus, while affording sufficient ingress, altogether restrain egress.

PARIS EXHIBITION OF 1867.

The Imperial Commission has announced the completion of its list of Jurors for the awards.

The special jury appointed, on the part of France, to award the prizes to be given to the originators or organisers of those industrial establishments which shall have produced the greatest amount of harmony amongst employers and employed, and thereby aided the physical, mental, and moral improvement of the working classes, consists of:—M. Rouher, Minister of State; M. Béhic, Minister of Agriculture, Commerce, and Public Works; Marshal Vaillant, Minister of the Emperor's Household and of the Beaux Arts; M. Magne, Member of the Privy Council; the Archbishop of Paris; M. Schnsieder and M. Alfred Le Roux, Vice-Presidents of the Corps Legislatif; M. Paulin Talabot, Deputy; and M. Le Play, Councillor of State and Commissaire-General of the Institution.

The following is the list of Presidents and Vice-Presidents of the Juries of the nine Industrial Groups, forming the French portion of the Superior Council of Jurors:—M. Elie de Beaumont, Senator and Perpetual Secretary of the Academy of Sciences; M. Denière, formerly President of the Tribunal of Commerce of Paris; M. Arlès Dufour; M. Michel Chevalier, Senator; M. Dupuy de Lôme, Councillor of State, &c.; M. Lefuel, Member of the Institute; M. le Duc d'Albúfera; M. Dumas, Senator, Member of the Institute; M. Kuhlmann, President of the Chamber of Commerce of Lille; M. Devnick, formerly President of the Tribunal of Commerce of Paris; and M. Jean Dollfus, Maire of Mulhouse.

The following is the list of Class Jurors:—

CLASS 6.—*Printing and the Library*.—MM. De la Guéronnière, and Darenémesnil, of the Imprimerie Impériale.

CLASS 7.—*Stationery, Bookbinding, and Artistic Materials*.—M. Quicherat, Member of the Institute; M. Rouilhac, merchant.

CLASS 8.—*Application of Design in the Ordinary Arts*.—M. Baltard, Member of the Institute, architect; Ed. Taigny.

CLASS 9.—*Photography*.—Count Olympe Aguado; M. Niépce de St. Victor.

CLASS 10.—*Musical Instruments*.—General Mellinet, senator, &c.; M. Ambrose Thomas, composer.

CLASS 11.—*Medical Apparatus, &c.*—Dr. Nélaton; Dr. Tardieu.

CLASS 12.—*Instruments of Precision and for the study of the Sciences*.—M. Milne-Edwards, Member of the Institute; M. Foucault Edwards, Member of the Institute.

CLASS 13.—*Maps, Charts, and Geographical Apparatus*.—Vice-Admiral Paris, Member of the Institute; Col. Ferri Pisani, of the Etat-Major.

CLASS 14.—*Artistic Furniture*.—M. Du Sommerard, Director of the Museum of Cluny; M. Williamson, Administrator of the Mobilier de la Couronne.

CLASS 15.—*Upholstery and Decorative Work*.—M. Gustave de Rothschild; M. Diéterle, decorative painter.

- CLASS 16.—Crystal and Stained Glass.**—M. Peligot, Member of the Institute; M. George Bontemps, formerly manufacturer.
- CLASS 17.—Porcelain, Faïences, &c.**—M. Regnault, Member of the Institute, director of the Sèvres works; M. Domarmatin, merchant.
- CLASS 18.—Carpets, Tapestry, and Furniture Tissues.**—M. Badin, Director of the Gobelins, &c.; M. Carhian, merchant.
- CLASS 19.—Paper-hangings.**—M. Cicari, decorative artist; M. Délicourt, formerly manufacturer.
- CLASS 20.—Cutlery.**—General Gaiod; M. Dubocq, mining engineer.
- CLASS 21.—Goldsmiths' Work.**—M. le Duc de Cambacères; M. P. Christofle, goldsmith.
- CLASS 22.—Bronzes and other Artistic Works, cast and chased.**—M. le Baron de Buteval, senator; M. Barbedienne, manufacturer.
- CLASS 23.—Clock and Watch Making.**—M. Langier, Member of the Institute; M. Bréguet, manufacturer.
- CLASS 24.—Apparatus for Lighting and Heating.**—M. Clerget; M. Camus, of the Gas Company of Paris.
- CLASS 25.—Perfumery.**—M. Barreswill, Member of the Consultative Committee of Arts and Manufactures; M. Aubrey-Lecomte, Conservator of the Colonial Museum.
- CLASS 26.—Articles in Morocco, Tabletterie, and Basket-work.**—M. Wolowski, Member of the Institute; M. Louis Aucoc, manufacturer.
- CLASS 27.—Cottons and Cotton Thread.**—M. Gustave Roy, merchant; M. Fouquet-Lemaître, manufacturer; M. Seyer, manufacturer.
- CLASS 28.—Lins and Yarns.**—M. Varin, merchant; M. Legentil, fils, merchant; M. Casse, manufacturer.
- CLASS 29.—Woolens and Yarns, combed.**—M. Larbannier, manufacturer; M. Seydoux, manufacturer; M. Delatre, sen., manufacturer; M. De Brunet, of Rheims, manufacturer.
- CLASS 30.—Woolens and Yarns, carded.**—M. De Montagnac, manufacturer; M. Guillaume Petit, manufacturer; M. Vauquelin, manufacturer.
- CLASS 31.—Silk Tissues and Yarns.**—M. Payen, merchant; M. Jules Baimbert, merchant; M. Girodon, of Lyons.
- CLASS 32.—Shawls.**—M. Germain Thibaut, formerly manufacturer; M. Gausson, formerly manufacturer.
- CLASS 33.—Lace, Embroidery, and Trimmings.**—M. Louvet, manufacturer; M. Læven-Delhayé, formerly manufacturer.
- CLASS 34.—Hosiery, Linen, and Small Articles of Dress.**—M. Tailboins, manufacturer; M. Duvelloy, manufacturer; M. Carcenac, formerly merchant.
- CLASS 35.—Clothing.**—M. A. Dusautoy, merchant; M. Ch. Petit, manufacturer; M. Latour, manufacturer; M. Laville, manufacturer; M. Balsan-Martin, manufacturer.
- CLASS 36.—Jewellery and Trinkets.**—M. Fossin, formerly Judge of the Tribunal of Commerce; M. Beaugrand, jeweller.
- CLASS 37.—Portable Arms.**—Colonel the Baron Treuille de Beaulieu, Director of the Artillery trying-house; M. A. Fouquier.
- CLASS 38.—Articles for Travelling and Camp Use.**—M. Alexis Godillot, manufacturer; M. Feston, of the Ministry of War, &c.
- CLASS 38.—Bimbeloterie (small wares).**—M. Jules Delbruck, author of technical works; M. Trélon, formerly manufacturer.
- CLASS 40.—Mining and Metallurgy.**—M. De Billy, Inspector-General of Mines; M. Goldenberg, manufacturer; M. Rivot, mining engineer.
- CLASS 41.—Forest Products.**—Marquis De Vibraye; M. Des Meloize, Keeper of the forest of Bourges.
- CLASS 42.—Products of the Chase, &c.**—M. Duchartre, Member of the Institute; M. Servant, merchant.
- CLASS 43.—Agricultural Products (not alimentary) of preservation.**—M. Lestiboudois; M. Moll, professor; M. Borie, journalist.
- CLASS 44.—Chemical and Pharmaceutical Products.**—M. Balard, Member of the Institute; M. Sainte Clair-Deville, Member of the Institute; M. Daguin, Judge of the Tribunal of Commerce.
- CLASS 45.—Bleaching, Dyeing, Calico, &c., Printing.**—M. Perroz, professor; M. Bontarel, dyer.
- CLASS 46.—Leather and Skins.**—M. Faulen, formerly manufacturer; M. Ricord, merchant.
- INSTRUMENTS AND PROCESSES.**
- CLASS 47.—Mining and Metallurgy.**—M. Caillon, mining engineer; M. Salmon, merchant; M. Lan, mining engineer.
- CLASS 48.—Rural and Forest Culture.**—General Allard; M. Boitel, Inspector-General of Agriculture; Hervé Mangon, engineer-professor.
- CLASS 49.—Hunting, Fishing, &c.**—M. Coste, Member of the Institute; M. Coumes, Inspector-General of bridges and roads.
- CLASS 50.—Rural Factories and Alimentary Industries.**—M. Boussingault, Member of the Institute; Lacalliet, director of the Agricultural School of the Saubatie; Comte de Pourtalès.
- CLASS 51.—Chemical Arts, Pharmacy, and Tanning.**—M. Pelouse, Member of the Institute; M. Frémy, ditto; Dr. Grandeau.
- CLASS 52.—Prime Movers, Boilers, and Apparatus used for the purposes of the Exhibition.**—M. Gonin, engineer; M. Jacmin, engineer-professor; M. Manton, engineer-professor.
- CLASS 53.—Machinery and Apparatus in general.**—M. Combes, Member of the Institute; M. Tourneyron, civil engineer; M. Luuyt, engineer of mines.
- CLASS 54.—Machine Tools.**—M. le Baron Renouard de Bussière, Director of the Mint; General Morin, Member of the Institute; M. Tresca, of the Conservatoire des Arts-et-Métiers.
- CLASS 55.—Machinery for Spinning and Twisting.**—M. Alcan, professor; M. Mercier, mechanician.
- CLASS 56.—Weaving Machinery.**—M. Schlumberger, mechanician; Villeminot-Hurard, manufacturer, Rheims; H. Scribe, manufacturer.
- CLASS 57.—Machinery and Processes of Sewing and making Garments.**—M. le Baron Seguié, Member of the Institute; M. Haas, manufacturer.
- CLASS 58.—Materials and Processes of Furniture Making.**—M. Bourneicau, engineer; M. Renard, contractor.
- CLASS 59.—Materials and Processes of Paper-making, Dyeing, and Printing.**—M. C. Laboulaye, formerly manufacturer; F. Normand, mechanician; A. Doumerc, director of paper manufactories.
- CLASS 60.—Miscellaneous Machines, Instruments, and Processes.**—M. Leblanc; M. Caillon, civil engineer.
- CLASS 61.—Coach-building and Cart-making.**—M. Binder, late Judge of Tribunal of Commerce; Lavollée, director of Omnibus Company.
- CLASS 62.—Saddle and Harness Making.**—The Prince de Beavau; M. Moissette, director of omnibus works.
- CLASS 63.—Railway Material.**—M. Gayant, Inspector-General of Roads and Bridges; M. E. Flachet, consulting engineer of the W. and S. railways of France; M. Couche, engineer of mines.
- CLASS 64.—Telegraphic Apparatus and Processes.**—The Vicomte de Nougé, Director-General of Telegraphs; M. E. Bequerel, Member of the Institute.
- CLASS 65.—Civil Engineering, Architecture, and Public Works.**—M. Reynaud, Inspector-General of Roads and Bridges, professor; M. Viollet le Duc, architect; M. Delesse, engineer of mines; M. le Baron Baude, engineer of roads and bridges, professor.
- CLASS 66.—Material of Navigation and the Saving of Life.**—M. de Fréminville, of the school of Marine Artillery; M. Le Normand, shipbuilder, Havre; M. Dumoustier, of the Ministry of Public Works.
- FOOD, FRESH OR PRESERVED.**
- CLASS 67.—Food and Farinaceous Substances.**—M. Darblat, of the Ministry of Agriculture.

CLASS 68.—*Bread and Pastry*.—M. Husson, Member of the Institute; M. Foubert, of the Ministry of Agriculture.

CLASS 69.—*Oil and Fatty Substances, Milk, Eggs*.—Dr. Wurtz, Dean of the Faculty of Medicine; Dr. Poggiale, Inspector General of Military Pharmacy.

CLASS 70.—*Meat and Fish*.—M. Payen, Member of the Institute; M. Legendre.

CLASS 71.—*Vegetables and Fruits*.—M. Mercier, manufacturer; M. Pépin, of the Jardin des Plantes.

CLASS 72.—*Condiments and Stimulants; Sugar and Confectionary*.—M. Ménier, manufacturer; M. Jacquin, jun., manufacturer.

CLASS 73.—*Fermented Liqueurs*.—M. Pasteur, Member of the Institute.

CLASS 74.—*Reclamation of Lands and Agricultural Factories*.—The Marquis d'Havrincourt; M. Tisserand, of the Imperial agricultural establishments.

CLASS 75.—*Horses, Asses, Mules, &c.*—M. Rouy, of the Imperial Haras; M. Simons, agriculturist.

CLASS 76.—*Bullocks, Buffaloes, &c.*—M. de Saint Leger, agriculturist; Dr. Henry Bouley, Inspector-General of Veterinary Schools.

CLASS 77.—*Sheep, Goats, &c.*—The Comte de Bouillé, agriculturist; Dr. Magne, Director of Veterinary School.

CLASS 78.—*Pigs, Rabbits, &c.*—M. Bella, Director of Agricultural School; M. Raynal, Professor, Veterinary School.

CLASS 79.—*Poultry*.—Comte L. Le Hon; M. Florent Prévost, of the Jardin des Plantes.

CLASS 80.—*Dogs*.—Comte Leconteux de Cantelau; M. Pierre Pichot.

CLASS 81.—*Useful Insects*.—M. de Quatrefages, Member of the Institute; M. Blanchard, Member of Institute.

CLASS 82.—*Fish, Crustacea, &c.*—Captain Champeaux, Imperial Navy; M. Gerbe, College of France.

CLASS 83.—*Glass-houses and Horticultural Material*.—M. Darcel, engineer of roads and bridges; M. Hardy, garden of Versailles.

CLASS 84.—*Ornamental Plants and Flowers*.—M. A. Brongniart, Member of the Institute; M. Lucy, Vice-President of Paris Society of Horticulture.

CLASS 85.—*Kitchen Gardening*.—M. A. Rivière, Luxembourg garden; M. Courtois-Gérard, merchant.

CLASS 86.—*Fruit and Fruit Trees*.—M. Decaisme, Member of the Institute, professor; Dr. Guyot, vine-cultivator.

CLASS 87.—*Seeds and Plants of Forest Trees*.—M. Moreau, Judge of the Tribunal of Commerce; M. De Gayffier, Sub-Inspector of Forests.

CLASS 88.—*Hot-house Plants*.—Dr. Chattin, Hôtel Dieu; M. Barillier Déschamp, gardener of City of Paris.

ECONOMIC GROUP.

CLASS 89.—*Instruction of Children*.—M. Flindin, Councillor of State; M. Léon Plée; M. Marguerin, Ecole Murpot; M. Laurent de Billé.

CLASS 90.—*Adult Education and Libraries*.—M. C. Robert, Councillor of State; M. Pompée, School of Jory; M. Demarquay, Surgeon; M. De Mofras, Secretary of Embassy; M. Sebastian Cornu, painter.

CLASS 91.—*Furniture, Clothing, and Food*.—M. Vuillefroy, Sénateur; A. Cochin, Member of the Institute; M. V. Darroux, service of military clothing; M. Moréno-Henriques, Douane; M. Bouffard, merchant; M. Ducuing, economist; M. Jourdain, formerly manufacturer; M. Aimé Sellières, manufacturer.

CLASS 92.—*National Costumes*.—M. Armand Dumaresq, painter; M. Ernest Dréolle, writer.

CLASS 93.—*Sanitary Habitations*.—M. Conti, Chef du Cabinet of the Emperor; M. Degrand, engineer of roads, &c.

CLASS 94.—*Productions of Working Masters*.—M. Mathieu, deputy; M. Auguste Vitu, writer; M. Saint-Yves, engineer of roads, &c.

CLASS 95.—*Tools and Processes of Working Masters*.—

M. Darimont, deputy; M. Van Blarenbergh, engineer of roads, &c.; M. Grohè, manufacturer.

According to an Imperial decree, the appointment of the jurors for the group of the Fine Arts is postponed until the juries of admission have finished their labours.

The election of the latter body has just taken place, two-thirds having been chosen by the body of decorated artists, and one-third by the administration. This election created considerable interest, and the result is such as fully to warrant the experiment. The following are the names of the artists elected:—

In the section of Painting and Drawing (number of votes, 147).—MM. Pils, Cabanel, Gérôme, Ingres, Bida, Hébert, Fromentin, Breton (Jules), Baudry, Meissonier, Gleyre, Théodore Rousseau, Français, Brion, Jalabert, Couture.

In Sculpture, (70 votes).—MM. Guillaume, Barye, Cavellier, Dumont, Bonnassieux, Thomas, Soitoux, Joffroy, Perraud, Cabot.

In Architecture (33 votes).—MM. Duc. (J.L.) Garnier, Duban, Ballu, Vaudoyer, Henri Labrousse.

In Engraving and Lithography (25 votes).—MM. Henriquel-Dupont, Achille Martinet, Alphonse, François, Mouilleron, Charles Jacque, Gaucherel.

To those have been added by the Imperial Commission:—

Section of Painting and Drawing.—MM. Cottier, J. Halphen, Lacaze, Charles Leroux, le Marquis Maison, Frédéric Reiset, Paul de Saint-Victor, le Comte Welles de la Valette.

Section of Sculpture.—MM. Charles Blanc, de Longpérier, Michaux, Soulié, Théophile Gautier.

Section of Architecture.—MM. de Caumont, le Baron de Guilhermy, Albert Lenoir.

Section of Engraving and Lithography.—MM. Ad. de Beaumont, le Vicomte H. Delaborde, Marcellé.

Fine Arts.

ROYAL ACADEMY.—The President, according to annual custom, distributed, on Monday evening last, the medals won by the pupils. Prizes were awarded to drawing, painting, and modelling from the life, copy painting from ancient masters, drawing and model from the antique, restoration of the Theseus, drawing in perspective, &c. The President expressed the desire of the Academy to promote the study of architecture, and at the same time the regret and astonishment they had felt that the prize offered to architectural pupils had not for three years obtained a competitor. He hoped in the coming year for a more encouraging result. Sir Francis Grant then delivered to the students the first discourse since his election as president. He commenced by paying a fitting tribute to the erudition, judgment, and gentlemanly bearing of his predecessor, Sir Charles Eastlake, whose loss was especially felt on those occasions. He then dwelt on the advantages to be derived from intellectual culture and general accomplishments, which would not fail to be reflected in corresponding refinement in the painters' works. He in like manner urged the students to cultivate high tone of mind and gentlemanly feeling, as sureties of success in after-life. He also spoke against the practice of Sunday work. God's blessing could not be expected when His laws were broken; and even on lower grounds jaded powers required a day of rest. The president further observed that students now possessed greater advantages than in former times, therefore more would be expected of them. Not only within the walls of the academy existed better means of study, but likewise the accumulated works by the old masters in the National Gallery secured to young artists great benefits. Sir Francis Grant earnestly recommended the study of Raphael, Titian, Correggio, Claude, &c., among the old masters, and Reynolds and Turner in our own school. By such

appeal to historic works the mere passing fashion of the day might receive correction. He did not deem Pre-Raphaelite painters, however admirable for colour and devotional expression, fit subjects for imitation. The president then continued that there was for all of them one special cause for congratulation. They knew that notice had been received to quit the premises in which they were now assembled; but they had obtained another site equally good, where they would be able to provide exhibition rooms double in extent of the present. It was not intended that the academy should in consequence receive an inferior class of works. The high quality of the exhibition would be maintained, yet he hoped that every picture accepted on its merits might obtain a place. He could assure his hearers that the inevitable rejection of so many good pictures had occasioned the Academy sincere sorrow. It was the students who would chiefly reap the advantages to be secured by the new building. In conclusion, Sir Francis Grant assured all present that he should be happy on every occasion to assist students in the prosecution of their labours. They might come to him as President, without introduction. It may be interesting to know that on the 11th December, 1769, ninety-seven years previously, almost to the very day, Sir Joshua Reynolds, the first President of the Academy, made the first distribution of prizes to its students. He then delivered the second of those discourses, which are now text-books to artists.

ROYAL ARCHEOLOGICAL INSTITUTE.—Mr. George Scharf has given, at a meeting of the Archaeological Institute, an account of the proceedings lately taken for the restoration of the ancient portrait of King Richard II. This portrait, which used to hang in Westminster Abbey, above the Lord Chancellor's pew, was, when recently exhibited in South Kensington, accepted as among the very few authentic works of the fourteenth century. The original picture had been, however, in great measure hidden by successive coats of paint put on by restorers. These have now been removed by Mr. H. Merritt, under the supervision of Mr. George Richmond. The portrait of Richard II., as now revealed, may, it is believed, have been painted from the life.

Manufactures.

SHIP-BUILDING IN CALIFORNIA.—For many years towns such as San Francisco have had recourse to importation in order to obtain their necessary wants. General industry develops itself but slowly in these colonies, peopled from causes such as the discovery of diggings or gold mines. It results from this an increase in the price of land, labour, and provisions, that checks certain enterprises that may be easily replaced by importation. Ship-building, for instance, requires such special conditions, that in places where these conditions are not united, it is not attempted, and it is preferred to order the ships from foreign countries. Formerly the ship-building at San Francisco was limited to the construction of boats, or some decked vessels of insignificant tonnage, intended for coasting trade. At the present time several vessels are built at San Francisco of a size that an older port might be proud of. The Californian ships are usually built of the oak of the country; however, there is on the stocks a schooner; the keel, the keelson, and ribs are of teak, and the deck planking is to be constructed of the same material. The teak is a wood the hardest which is known for ship-building purposes. That wood, at San Francisco, is imported from Batavia. This wood is not more expensive than Californian oak, or imported oak timber. The principal drawback in California to the development of ship-building, is not the want of good shipwrights so much as the high price of labour and the scarcity of timber of first-rate quality in the market. But time will overcome these obstacles, and labour

becomes each day cheaper, and the forests on the borders of the Pacific are only beginning to be worked. When the country is better provided with roads and railways, ship-building will develop itself.

Commerce.

CUBAN EXPORTS.—In September, the Spanish Government abolished export duties in the island of Cuba, and, on the very first day the measure came into operation, 15,000 cases of sugar were declared for export, the daily average having never before exceeded 300; and 374,000 cigars were also declared, in place of the average of 28,000.

WOOL IMPORTS.—The total imports of sheep's wool into the leading ports of the kingdom in October were 82,835 bales, and of goats' wool 3,921 bales. Of the sheep's wool 43,371 bales came to London, 28,517 to Liverpool, 7,830 to Hull, and 3,117 to Leith. The colonial wool received was 7,301 bales, from the Cape and Natal 25,961, and from the East Indies 12,197 bales.

PRODUCTION OF WOOL IN THE ARGENTINE REPUBLIC.—In the province of Buenos Ayres the production of wool has obtained an immense development. The exportation of wool from Buenos Ayres in 1832 was only 944 bales. In 1840 it had increased to 3,677 bales; in 1850 to 17,069 bales; in 1860 to 60,872 bales; and finally in 1864 to upwards of 115,000 bales, the quality of which is not surpassed by that of Australia, which represents a value of £2,200,000 sterling. For the last sixteen years the quality of the wools has been considerably improved by the introduction of certain breeds, especially those of Rambouillet and of Saxony. It is now estimated that the province of Buenos Ayres alone supports not less than 30 millions of sheep.

Colonies.

SOUTH AUSTRALIAN STATISTICS.—It appears from the government returns made up at the end of June, 1866, that purchased land is held by the colonists to the extent of 80 acres to every member of the community, or an increase of two acres on the year previous, and that of this land the proportion cultivated is 16½ acres to every person. As to the amount of taxation paid through the Customs, it is shown that in this colony the rate is 30s. per head, in New South Wales 40s. per head, in Victoria 32s. per head, in Queensland 76s. per head. Then in the matter of the bonded debts the comparison is still more striking:—

	Population.	Debt.	Per Head.
New South Wales...	421,000	£5,638,630	or £13 8
Victoria	632,998	8,733,445	„ 13 16
Queensland	95,100	3,021,186	„ 31 15
South Australia...	165,934	751,600	„ 4 10

These figures tend to show that if ever there was a colony that ought to progress South Australia is one, its burdens being light, and its not being taxed a seventh of the extent of the colony of Queensland. The estimated revenue from the Customs for the year 1867 is £255,000, against £244,261 for the year ended June, 1866, but this increase depends upon next harvest. The revenue from land sales is put down at the reduced amount of £220,000, which the treasurer thinks sufficient, considering that the purchasing power of the community is already small, and that it is the policy of government not to press sales unduly. The amount proposed to be spent in immigration is £25,000, and the total provision made in the estimates for public works is £170,370; but this is inclusive of £147,000 for road purposes, which the government intend to borrow from the immigration fund through the issue of bonds under the Bond Act of 1864.

AGRICULTURAL SOCIETIES IN VICTORIA.—There are 32 agricultural societies and farmers' clubs throughout Victoria, and their revenue for 1865 was £7,069 18s. 1d., which was supplemented by grants out of the vote of the Government to the Board of Agriculture to the amount of £4,000, in a certain proportion to the amount locally received. The £8,500 which the Board has to spend in the current year is allocated as follows:—In aid of agricultural societies, £4,500; premiums, experiments, contingencies, and for national shows, £1,285; expenses of the Board and Council, £175. It may be mentioned that certain national shows, in which the neighbouring colonies compete, are managed by the Board, either alone or in co-operation with the local society in whose district the show is held. The Board also endeavours to be of use in encouraging experimental farming. As showing what the Board of Agriculture and the local societies do among them for the promotion of agriculture by means of competitive examinations, it may be stated that, in the year 1865-66, £5,748 16s. 6d. was given in premiums at shows managed by the societies. The exhibits comprised horses and cattle, sheep and wool, swine, poultry, and dairy produce, implements and machinery, agricultural, vineyard, and orchard produce.

Obituary.

M. VIDÉ, the inventor of the aneroid barometer, died some months since at Paris. The following particulars of his life have been kindly furnished by Mr. W. A. Gilbee:—"Having had an acquaintance with M. Vidé (in connection with my late uncle and partner, his friend and agent), for about 25 years, I beg, in the absence of a more able narrator, to offer some particulars relating to this remarkable and celebrated inventor, in relation with his simple and efficient instrument, thinking they might perhaps be of interest to the readers of your *Journal*. Although his first English patent for the aneroid barometer is dated the 27th April, 1844, M. Vidé's name was scarcely known until recently, his desire for public *clat* being as small as his indomitable will and perseverance were great. The reward he sought was the consciousness of having aided scientific researches, by adding to the meteorological instruments of his day. Still, like many inventors, his fortune was far from being made, and, but for his agent, the bringing out of his invention might have been much longer delayed. M. Vidé was a native of Nantes, in France, and was educated for the bar, but turned his attention to mechanical pursuits, and by dint of many years of strenuous and unremitting exertions, and after repeated failures, he succeeded, the instrument which he called the aneroid barometer being the fruit of his labours, the word "aneroid" signifying without liquid, in contradistinction to the ordinary mercurial or other liquid barometer. Subsequently, improvements were made and patented by M. Vidé in the registering mechanism of his instrument, but without affecting the principle, which remains the same, and is too well known to require description. M. Vidé's rights to the principle of the invention were encroached upon in France, giving rise to lengthened and expensive litigation, which, however, terminated in the acknowledgment of M. Vidé's right to it, by the highest tribunal. Before the expiration of his patent, M. Vidé had realized what was supposed to be a large fortune (too large for counsel to advise an application for an extension of his patent in England), and he sought relief and recreation in travelling to the chief capitals of Europe, his journeys being performed in the most rapid manner that modern improvements would allow, and with total disregard to the wear and tear of his own frame. I am informed that in one of these rapid excursions the seeds of a disease were sown which brought his life to a close."

Publications Issued.

LESSONS IN ELEMENTARY PHYSIOLOGY By Thomas Huxley, LL.D., F.R.S. (*Macmillan*).—This work is primarily intended to serve the purposes of a text-book for teachers and learners in boys' and girls' schools. The object has been to set down in plain and concise language that which any person who desires to become acquainted with the principles of human physiology, may learn with a fair prospect of having but little to unlearn as his or her knowledge widens.

Notes.

MUSIC.—It is said that Dr. Wyldé has purchased the German Bazaar in Langham-place, with the view of building a music-school there, and, in connexion with it, a concert-room and a theatre.

STORM WARNINGS AND WEATHER REPORTS.—The Board of Trade has issued the following circular, dated the 29th of November:—"The Board of Trade have had under consideration the report of a committee appointed by the Royal Society, the Admiralty, and the Board of Trade, to inquire into the constitution and functions of the Meteorological Department, which recommended, as the most important step to be taken, the transfer of the management of the business of the department to a scientific body. The Board of Trade have also consulted the Royal Society upon the subject of this report, and the President and Council of the Royal Society concur generally in the measures recommended by the committee, and are prepared to undertake the duty proposed to them. With regard to the issue of storm warnings, the President and Council of the Royal Society are of opinion that 'at present these warnings are founded on rules mainly empirical,' and therefore should not be issued under the superintendence of the scientific body to whom the discussion of meteorological observations will be committed. The President and Council think, however, that 'in a few years they may probably be much improved by deductions from the observations in land meteorology, which will by that time have been collected and studied; and that the empirical character may thus be expected to give way to one more strictly scientific, in which case the management of storm warnings might be fitly undertaken by a strictly scientific body.' Under these circumstances the Board of Trade are compelled to suspend, from the 7th of December next, 'cautionary storm-warnings,' which have from time to time been issued by the Meteorological Department of the Board of Trade. It is hoped that the warnings may be resumed by the new Meteorological Department at no distant time upon an improved basis. In the meantime the daily 'Weather Reports' will be received and published as heretofore. If at any port or place there is a desire to have these reports, or any part of them, communicated by telegraph on the morning on which they are received, they shall be so communicated, on a request to that effect being sent to the Board of Trade, accompanied by an undertaking to pay the expense of the telegram from London to the port or place.—T. H. FARRER."

Correspondence.

TRADE IN FOREIGN CATTLE.—SIR,—In the *Standard* of Thursday, December 6th, I find a notice of a paper read by Mr. John Irwin at the Society of Arts. Mr. Irwin has committed an error in his calculation, stating the number of cattle in Belgium to stand at about 3½ (cattle) to 1 (population); and this is of great importance to the question at issue, which must serve as

my apology for addressing you. Mr. Irwin mentions specially the latest statistics. Now, the latest census in Belgium was in 1862 (31st Dec.) and the population according to this was 4,836,566 souls; consequently if there were nearly 3½ head of cattle for each soul, the total amount of cattle would be nearly 17,532,551 head, which would be very surprising, because it differs so amazingly from the result of the census of 1838-40, 1846-47, and 1856, which I here transcribe:—

	Souls.		Head.
Population 1839 ..	3,992,241	Cattle 1830 ..	912,740
" 1847 ..	4,337,195	" 1846 ..	1,203,891
" 1856 ..	4,529,560	" 1856 ..	1,257,649
" 1862 ..	4,836,566	" 1862

Not having myself the cattle census for 1862, I leave a blank; probably, according to Mr. Irwin's statistical sources of information, this should be filled up with 1,334,225 head, which would show the progressive increase to be steady and regular, for it is quite impossible that there could have been an increase from 1,257,649 head in 1856 to 17,532,551 head in 1863. The proportion should therefore stand for Belgium at nearly 3½ souls to 1 head of cattle, or about 0.275 (less than ¼) head of cattle for each soul, placing it between Sweden and Holstein, instead of at the head of the list. In further proof of this we have only to look to the table of exports and imports. In 1854 Belgium imported 35,842 head of cattle, and exported 62,709; excess of exports, 17,065. In 1862 Belgium imported 64,882 head of cattle, and exported 59,318; excess of imports, 5,564. Mr. Irwin's mistake was evidently the result of a clerical error, the division having been effected the wrong way. Will you kindly communicate the contents of this note to Mr. Irwin, and beg of him to have the kindness to let me know the name of the book or paper from which he took his statistical data, which seem otherwise very correct, as I am engaged on a paper for one of our magazines, and would be glad to have access to such important material.—I am &c., F. Dwyer, Major, Austrian Army. P.S.—If Mr. Irwin wishes to know the average quantity of meat per head consumed in some of the continental countries and armies, I can give it to him.

Journal of the Society of Arts.

FRIDAY, DECEMBER 21, 1866.

Announcements by the Council.

NOTICE TO MEMBERS.

The large and interesting collection of photographs, illustrative of the Paper read by Mr. Fergusson, on Wednesday evening last, will remain in the Society's room (by Mr. Fergusson's courteous permission) for the inspection of members and their friends during the Christmas week.

CANTOR LECTURES.

The first course of Cantor Lectures for the present session will be "On Pottery and Porcelain," and will be delivered by William Chaffers, Esq. It will consist of six lectures, and will commence on Monday evening, the 21st January next, and be continued on succeeding Monday evenings.

The second course will be "On Music and Musical Instruments," to be delivered by John Hullah, Esq. Arrangements for a third course are in progress.

The lectures will commence each evening at eight o'clock, and are open to members, each of whom has the privilege of introducing one friend to each lecture.

A new list of members of the Society has been printed, and any member can have a copy sent to him on application to the Secretary.

FOOD COMMITTEE.

The Council have passed the following resolution:—

"That a Committee be appointed to inquire and report respecting the Food of the People, especially, but not exclusively, the Working Classes of the people; and that, having regard to the publications of the Privy Council and other documents, which illustrate the defective amount of nutritious food available for the population at large, the said Committee do report respecting the resources which are, or might be rendered, available for the production, importation, and preservation of substances suitable for food, and for improving the methods of cooking in use among the Working Classes."

In accordance with this resolution, a Committee has been appointed, consisting of the following gentlemen, who have consented to serve:—

The Rt. Hon. H. A. Bruce,
M.P., *Chairman of the*
Committee.
The Right Hon. C. B.
Adderley, M.P.
*E. Akroyd, M.P.
*John Bell.
*Professor Bentley.
*W. H. Bodkin, *Assistant*
Judge.
*Harry Chester.
Hugh C. E. Childers, M.P.
Rev. W. L. Clay.
The Right Hon. W. F.
Cowper, M.P.
*Lord De L'Isle & Dudley.
W. Ewart, M.P.
R. Culling Hanbury, M.P.
G. W. Hastings.
*William Hawes.
John T. Hibbert, M.P.
*Chandos Wren Hoskyns.

*Lord Henry G. Lennox,
M.P.
W. H. Michael.
Lord Robt. Montagu, M.P.
W. Newmarch, F.R.S.
F. Pariah.
*Sir Thomas Phillips, Q.C.,
Chairman of the Council.
F. S. Powell, M.P.
C. S. Read, M.P.
G. Selater-Booth, M.P.
The Earl of Shaftesbury.
*Benjamin Shaw.
*Sir James Kay Shuttle-
worth, Bart.
W. T. McCullagh Torrens,
M.P.
*Thomas Twining.
James Ware.
Edward Wilson.
*G. F. Wilson, F.R.S.
Rev. C. Wright.

The first meeting of the Committee takes place this day.

INSTITUTIONS.

The following Institution has been received into Union since the last announcement:—

Werneth (Oldham) Mechanics' Institution.

ART-WORKMANSHIP PRIZES.

The Worshipful Company of Clothworkers have contributed the sum of ten guineas to the Art-Workmanship Prize Fund.

Proceedings of the Society.

FIFTH ORDINARY MEETING.

Wednesday, December 19th, 1866; Sir JAMES FERGUSSON, Bart., M.P., Under-Secretary of State for India, in the chair.

The following candidates were proposed for election as members of the Society:—

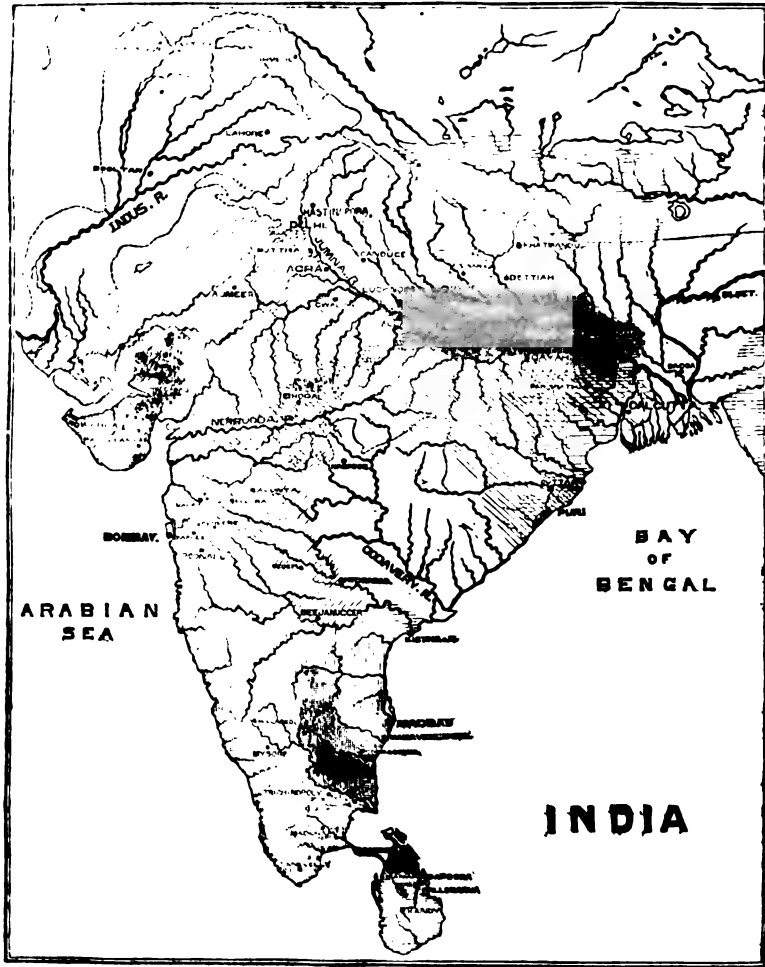

Bevan, Phillips, Albert-terrace, Windsor.
Davis, Sir John Francis, Bart., K.C.B., Athenæum Club,
S.W., and Hollywood, Henbury, Bristol.
Leeke, Henry J., 5, Clarence-terrace, Leamington.
Lewis, Evan, Aberdare.
Phillips, Thomas Henry, 61, Lime-street, E.C.
Pitter, Joseph, 2, Thanet-place, Strand, W.C.
Railton, George W., Alderley-edge, Manchester.
Roberts, Howland, Neilgherry-house, Hampstead, N.W.

The following candidates were balloted for, and duly elected members of the Society:—

Bentley, James, Woodgreen-park, Cheshunt.
Dyke, William Hart, M.P., Lullingstone Castle,
Kent.
Nicholson, William Henry, St. Margaret's, Rochester.
Poole, William, Hentland, Ross, Herefordshire.
Rowley, James Campbell, 2, Clarence-buildings, Booth-
street, Manchester.
Russell, C., Stubbers, Romford.
Wainwright, James Gadesden, Clapham-common, S.
Williams, John Carvell, Everdon-house, Surbiton, S.W.

The Paper read was—

* Those marked thus are Vice-Presidents or Members of the Council of the Society of Arts.

SKETCH MAP OF INDIA,

Showing the approximate Distribution of the four principal Styles of Hindu Architecture, viz. :—

- | | |
|--|---|
| Buddhist, distinguished by horizontal hatching |  |
| Dravidian, by perpendicular lines |  |
| Northern Hindu, by lines sloping to the right..... |  |
| Chalukya and Jaina, by lines sloping to the left |  |

ON THE STUDY OF INDIAN ARCHITECTURE.

BY JAMES FERGUSON, Esq., F.R.S.

At the request of several members of this Society I have undertaken a task which I commence with the unpleasant conviction that it is impossible I should succeed in its performance. When the proposition was first made to me, it was that I should give three or four Cantor Lectures, in which I was expected to make clear all the intricacies of Indian architecture. This I flatly refused to undertake, feeling the utter hopelessness of the task. Had I been asked to explain in four lectures all the peculiarities of Egyptian, Greek, Roman, and Gothic art, I might have ventured, for I could then have calculated on my audience understanding me when I spoke of temples and of churches, or defined the classical orders, or described pointed arches, window tracery, or spoke of aisles, or pinnacles and steeples, or such like objects. The case, however, would be widely different in India. How many in a mixed audience might I calculate upon as able to appreciate the difference between Buddhist and Jaina architecture, or between that of the Dravidian and Bengalee?—or who would know what I meant when I spoke of dagobas, vimanas, mantapas, or similar parts of a building? Without some previous local knowledge on the part of my audience, I felt that the task could not be accomplished in four or forty lectures, and even then with an amount of definition and illustration which is now impossible to contemplate.

The attempt being therefore abandoned, all I propose this evening is to try and point out to you the importance of the study of Indian art, and some of the means by which a knowledge of it may be obtained.

I need hardly add that if I am to treat so vast a subject in the short space of one hour, I must deal largely in dogmatic assertion, and you must take a great deal of what I say on trust, as it will be impossible to stop and explain my reasons on every point, but I trust that the photographs I have placed on these walls will suffice to bear me out on such points, and to convince you that I have at least some good grounds to go upon.

If, however, I am to end in being dogmatical, I must begin by being egotistical; and I hope you will excuse me in this, as it is not for the sake of speaking of myself, but because it appears to me that the shortest and simplest mode of explaining the present position of the subject is by recounting my own experience in regard to it.

When I was in India, between twenty and thirty years ago, the subject of Indian architecture had hardly been touched. Views of Indian buildings had, it is true, been published by Daniell and others, but no attempt had been made to classify them, and the vaguest possible ideas prevailed as to their age or relative antiquity. At that time, thanks to the learning and enthusiasm of Mr. James Prinsep, great progress was being made in the decipherment of Indian inscriptions, and the study of the antiquities of the country, and I determined to try if the architecture could not be brought within the domain of science. For several years I pursued the study almost unremittingly, and bit by bit the mystery unravelled itself. I learnt that there was not only one Hindu and one Mahomedan style in India, but several of each class; that these occupied well-defined local provinces, and belonged each to ascertained ethnological divisions of the people; and I also found out, much to my disappointment, that the presumed antiquity of the rock cut examples was a myth; and that the whole could be arranged into consecutive series, with well-defined boundaries.

When I returned to this country I commenced the publication of the results of my investigations, but the public were not then prepared for such works, and, like most authors in a similar predicament, I tired of publishing expensive books which nobody bought, or read, and which entailed a considerable pecuniary loss on their

authors. There the matter might have rested had it not been that lately photography had come to aid us in our researches. Every day new series of photographs are coming home from India. Almost all the best known buildings have been taken—some very imperfectly, it must be confessed, but still sufficiently well to authenticate or correct previous illustrations, and anyone, at a small expense, may now make himself master of any branch of the subject. For myself, I may say that I have learnt as much if not more of Indian architecture during the last two or three years than I did during my residence in India, and I now see that the whole subject may be made intelligible, and I see how it can be done. The defect of what has been done hitherto is that it has been done without system, and that unless the investigator has such previous knowledge as I happened to obtain when in the East, it is difficult to learn where to begin, and the difficulty will, I fear, remain till some good handbook or grammar of the subject is published. I have attempted something of the sort in the volume of my history just published, but it is meagre and far too short. 300 pages and 200 wood-cuts will not suffice for so vast a subject, and something more must be done before the study of Indian architecture will be easy or popular.

Many may be inclined to ask—Is it worth my while to learn all the hard unpronounceable names which are indispensable to the knowledge of the subject, or to render myself so familiar with all its myriad forms as to be able to detect their affinities or differences? What will there be to repay me for all this trouble? The answer to these questions appears to me to be twofold, and it is what I wish to impress on you this evening. The subject I believe to be important, and worthy of study, first as regards our knowledge of India itself, and in the second place from its bearing on our own architectural development.

Taking India first. It is, of course, difficult for me to guess what information my present audience may have on this subject, but this I know, that, in general society, very few have clear ideas of who the inhabitants of India are or whence they came. With most people the Hindus, or, as they used to be called, the Gentooes, are one people, at least as uniform as the Germans or French, and worshipping certain gods, whom they have superstitiously revered from time immemorial. When you begin to look below the surface you find the case is widely different. In the first place, the valley of the Ganges was, at the very dawn of history, inhabited by races whom we now are forced to call aboriginal, as we know nothing of their origin, and we find detached fragments of them existing in the hills under the name of Bhils, Coles, Gonds, &c. Leaving them for a moment, we find there a people whom we call Aryans, who came into India across the Upper Indus, it may be about 2,000 years before Christ, or even earlier. They first settled in the Punjab; then in the water shed, between the Sutlej and the Jumna; and, lastly, in Oude and further eastward. These were the Sanscrit-speaking races, to whom we owe all the important literary productions of India.

After a thousand years' sojourn in India they lost their purity of race, apparently by intermingling with the aboriginal races, and by the innate decay of enervation by the climate. This enabled a prophet called Sakya Muni, or now generally known as Buddha, to call upon the aboriginal races, and to convert the whole of Northern India to the religion known as Buddhism. It was not till 300 years after his death, which happened in 543, that this faith became the religion of the state. This happened in the reign of King Asoka, about 250 a.c., and for 1,000 years it continued the prevailing religion, though at the present hour there is not a native-born Buddhist in India, and but for the monuments we might almost be allowed to doubt its prevalence.

It is with this religion and this king that our architectural history begins in India. Before his time we have nothing, and in the annexed illustration we have a proof

FACADE OF CAVE IN BEHAR (TEMP. ASOKA, B.C. 250).

that we ought not to expect to find anything. It is well-authenticated example of his reign, and though cut in the granite rock every form and every detail is copied from some wooden original, showing that at the time it was executed stone architecture was unknown in India, and men were only beginning to think of a more durable material. From that time we have hundreds of examples in which we see the wooden forms gradually dying out and being replaced by those more appropriate to stone; and at last, after following it for 1,000 years, we find it gradually fading into the style contemporaneously elaborated by the Jains and Hindus, and dying out with the religion that gave birth to it.

Leaving the valley of the Ganges, we find another great immigration taking place. This time it was that of the Dravidian tribes, and instead of Balkh and Bokhara, from which the Aryan tribes came, their seat was further south, and they crossed the Lower Indus into Guzerat, and before we became acquainted with them had got pressed down by subsequent immigration into the southern angle of the peninsula. They now occupy the whole, or nearly so, of the Madras Presidency, and are one of the greatest building races in the world, but totally distinct from those found further north.

The next great immigrations commenced a century or two before the Christian era, and continued through the centuries immediately following that event. They came across the Lower Indus, occupied Guzerat and Rajpootana, and eventually extended to the Mysore on the one hand, and to Agra and Delhi on the north. The fourth great immigration was that of the Mahomedans, from the 11th to the 13th and 14th centuries. They came across the Upper Indus, and eventually spread down as far as the Mysore, occupying the whole of Indus more nearly than any of the preceding races. The fifth civilization is our own. We are the only people who came, not across the Indus, but by sea, but of course I need not allude either to our ethnology or our art on the present occasion.

Now, what I want to tell you this evening with regard to this branch of my subject is, that all this is written as clearly in the architecture of the country as if it were engraved on the map. No one who travels through the country, and is familiar with such researches, can fail to perceive easily when and where the Buddhist religion arose, and how far it spread—how pure it was at first,

and how it gradually became idolatrous and corrupt, and how at last it perished beneath its own overgrown hierarchy. Nor can he help seeing how the Jaina religion superseded Buddhism among the Rajpoots, and how that eventually degenerated into the religion of Vishnu, which is its present and corrupt form.

The limits of the Dravidian style are equally strongly and clearly marked, and from their architecture we learn how far they ever penetrated northwards, and at what time, and where from, and when they were pressed backwards by the northern races. We can see the aboriginal tribes of Bengal, who were driven to the hills by the Aryans, and who retained their ancient faith in spite of the Buddhist reform, emerging from their fastnesses, in modern times, and gradually extending their style over the plains they had originally occupied. In fact the architecture of the country may be considered as a great stone book, in which each tribe and race has written its annals and recorded its faith, and that in a manner so clear that those who run may read.

All this ethnography, you may object, can be learned from the language of the people, and this has already been done to a great extent. Perhaps it has; and, if you will learn Sanscrit and Pali, and all the Pracrits—if you will master Tamul and Teloo-goo and Canarese—and study Bengallee, Maharattee, Gujerattee, and 50 other dialects, and if you are tolerably familiar, in addition, with Persian and Turkish, you may acquire the knowledge I have been pointing out, provided you can ascertain where all or each of these languages is or was spoken in India, and when it was introduced and ceased to be used. Even then the architecture has the advantage that it is more distinct, that it never shifts its locality, and that it does not change with time: and in India especially, where we have so many rock-cut examples, we know exactly what the religion, what the art, and what the civilization of the people were who excavated them. We stand actually, as it were, beside the people who were hewing the mountain into form, and we can read the thoughts they then were wishing to express.

It is the same with the structural buildings. To take one instance among many. I have here a representation of two temples at Badamee, on the limit between the northern and southern architectural provinces. Anyone at all familiar with the subject will at once recognize the difference between the two. That on the

DRAVIDIAN TEMPLE.

BENGALIAN TEMPLE.

AT BADAMI.

left is a straight-lined low pyramid, divided into storeys and adorned with pilasters. That on the right is curvilinear, with no trace of storeys or pilasters, and instead of the domical form that crowns the one it terminates in a conventional fruit-like ornament. I know that the people who erected the first must have been speaking Sanscrit or some of the allied languages when at work upon it, and that those who erected the other were speaking Bengalee or some tongue with a strong infusion of Sanscrit in its composition. If we knew their dates we could tell when the southern races extended so far north as this, or when the northern people penetrated so far south. So it is all over the country.

It seems almost impossible to over-estimate the value of these stone landmarks in a country where so few books exist, and so little history, and where what does exist is so very untrustworthy. So far as I can form an opinion, the architecture of India is not only the best means of elucidating the manners and customs of the country, but of checking their fables, and is frequently the only means that remain to us; and, if this be so, is it possible to over-estimate its value to those who wish to know who and what the people are or were whom we have undertaken to guide and govern?

It is not, however, only the ethnography that the architecture of India seems so completely to illustrate. It equally seems to fix the ever-varying form of the religions of that country, and to preserve them for our examination. In a country where printing was till very recently unknown, and where the climate is so destructive of writing materials, old books rarely exist, and it was too frequently the fashion to adapt each such succeeding transcription to the taste and feelings of the day. It is, consequently, only by an appeal from the paper to the stone book that we can know how far a religion had become degraded at any time, or when it prevailed, and by what people it was practised. One of the great characteristics of Indian architecture is the profusion of sculpture, which forms an absolutely essential part of it. And in this sculpture, more truly than in any written document, we can read the exact form of faith at any particular period.

There is still another aspect in which the architecture is vitally important, and that is with regard to history. I need hardly tell you that in India there are no written annals which can be trusted. It is only when they can be authenticated by inscriptions and coins that we can feel sure of the existence of any king, and it is only when we can find his buildings that we can measure his greatness or ascertain what his tendencies were, or what the degree of civilisation to which either he or his people had attained.

If the study of the architecture can make all this clear, I think I need hardly say that if anyone wishes to know what India was or is he cannot be far wrong in applying himself to its investigation.

It is practically more difficult to make the second part of my subject intelligible in a few words than it was with the first; but as I shall not have this time to deal with so unfamiliar a subject, or employ so many outlandish names, it may perhaps prove more interesting to my hearers.

In attempting to explain to you the importance of Indian architecture as bearing on our own, you will not of course expect me to recommend that you should copy any of its forms, though I believe there may be principles which it might be well to introduce, and suggestions which there might be no harm in adopting. The great merit, however, of its study I conceive to be the widening of our base of observation, and so enabling students to realise the true definition of the art, for till that is grasped there seems little hope of any improvement in our architecture.

I may perhaps make what I mean clearer by referring to our own recent experience. During the last century, when the education of gentlemen was confined to the classics, we knew and practised only Roman architecture, and as the middle and lower orders of our countrymen had no sympathy with Doric or Corinthian orders, they were content to go without architecture altogether. In the beginning of the century Greek architecture was practically discovered, and eagerly adopted by the highly-educated classes, but in the same manner as the other. We copied it without having any real sympathy

with it. At last we discovered that the middle ages had also an architecture of their own, and one with which we had, or might have, infinitely more sympathy. This was an enormous gain, not only because it enlisted a much wider class in the art, but more because it taught the architects how much wider the field of architectural design was than had been originally supposed. Unfortunately we took to copying Gothic art, as we then copied classical, and so far retarded progress. At last we begin to be tired of reproducing old things, and are beginning to think, instead of copying. The first symptom of this is that classical designs are not so rigidly classical as they were, but a certain amount of Gothic feeling is instilled into them; and Gothic designs are sometimes not so ludicrously mediæval as they used to be, but a certain amount of refinement, and of modern feeling and adaptation is thought expedient in civil, though hardly yet in ecclesiastical architecture. The two are approaching one another. When they are fused we shall have an architecture of our own; and I know nothing so likely to lead to such a result as the study of an entirely foreign style like that of India. I feel certain that no one can familiarise himself with Indian art without feeling that the architects of that country were as successful as either those of Rome or the Middle Ages in reaching the aims they were aspiring to; though in doing this they employed arrangements as different as possible from those we are furnished with, and adopted details and forms diametrically opposed in principle to those we have hitherto been taught to admire. Of course a man requires to familiarise himself with these forms before he can admire them, and he must understand their application before he can appreciate their adaptability; but once he has conquered this, it seems to me impossible he should arrive at any other conclusion than this:—That there is no form into which stone can be carved which is not beautiful if it is appropriate to the purpose for which it is employed, and that no form is preferable in architecture to any other form, except in so far as it is constructively better adapted to express the purpose for which it is placed where it is found.

The principle in fact is the same that pervades all the works of nature. I defy any one to give a good logical reason why the forms of a man's nose, or ear, or head, are beautiful. There is nothing in the shape of an eye, or an arm, or leg, or hand, or foot, that is beautiful abstractedly; but they are all beautiful, because they are exquisitely adapted to the purposes to which they are applied. So in every animal and every plant, when we understand and appreciate its structure; and the highest merit of architecture, and the noblest lesson we learn from its study, is, that of all man's works it is most like those of nature in principle and may be judged by the same rule.

As architecture has hitherto been studied it has been impossible to perceive this: and so long as we continue cribbed in the narrow school of classical or Gothic art it will be impossible to rise to such considerations. Once a man gets out of that groove, and perceives how wide the field is and how certain the result when following certain principles of common sense, the art becomes easy and failure impossible, and that principle may, I conceive, be more easily learnt in India than anywhere else I know of. This facility of learning arises not only from the immense number and variety of the ancient examples in every part of that country, but because you may now see those who can neither read, nor write, nor draw, building temples and palaces as beautiful in form and detail as those of their forefathers, and which are not copies, but elaborated on the same principles as resulted in the productions of our great mediæval cathedrals. But I must not detain you too long with these abstract doctrines. The lesson, I conceive, that every one must learn who studies such an art as that of India is, that a man can hardly fail in producing a good design if he thinks of what he is doing, and how he can do it best. Not only in architecture, but in every similar art, a

thoroughly purpose-like and appropriate design must be permanently successful. The most obvious proof of this is, that in Egypt, as in Greece and Rome; in the middle ages, in India and Cambodia, or China; even in Mexico and Peru; in every age and in every part of the world men, in every stage of civilisation, succeeded in producing beautiful and appropriate objects of architecture. Failure was unknown, till in the fifteenth century some evil-minded persons took it into their heads to revive, by copying classical art. Since that day success has been impossible, with all our civilisation and power, with all our mechanical skill, for since then nothing but failure after failure has marked the architecture of Europe. If, however, architects could once be taught to think, independently of copying, I feel convinced they might easily surpass all that has hitherto been done, and I do not know how they could learn this so easily and so pleasantly as by the study of an art which differs from all they have hitherto been accustomed to admire, but which still attains its ends as certainly and as successfully as is done in any of those styles with which we have up to this time been familiar.

Turning from these principles to the suggestions that may be derived from the study of Indian art, we approach a subject that admits of infinite illustration. I must, however, confine myself only to such as will explain what I mean, without attempting to do more. One of the best illustrations for the purpose that occurs to me is that of the arrangement of Jaina domes. Everyone

DIAGRAMS OF INDIAN DOME CONSTRUCTION.

will, I fancy, admit that abstractedly the dome is the most beautiful form of roof that has yet been invented, but there are very great difficulties in fitting its circular outline to the square and rectangular form of our halls and churches, and it is in consequence rarely employed in Europe.

In India they have surmounted these difficulties with great success, and generally in the following manner. As a rule the dome rests on eight pillars, but as an octagonal outline is necessarily a weak one, they almost invariably add four pillars, one on each angle, which makes up the number to 12, and the figure to a square. This in itself forms a very pleasing pavilion, and is very generally used in this form. When an extension is wanted two pillars are added on each face, making a quasi-cruciform plan with 20 pillars; or again four are added on each face, making 36 pillars, or again five on each face, making up 56 pillars, which is the largest number I ever saw employed in a single porch.

Now, I have no hesitation in asserting that the pillars of the porch are more artistically arranged than any equal number in any building in the West. In the first place, the octagon in the centre has the happy property that when its sides are produced into a square they are in the ratio of 10 to 7, and this proportion consequently prevades the whole structure, the length of the greater and lesser aisles being in the same ratio. In Gothic buildings the ratio of the side to the centre aisles is as one to two generally, and the height of the principal one is also doubled. Here they are of one height, and just in that proportion which is best suited to give dignity to the central without overpowering the side aisles. By this arrangement, also, the principal aisles are longer than the minor ones in the same ratio, as they run along the diagonal of the square. But the greatest beauty of the arrangement, perhaps, is the position of the dome in the centre exactly where dignity is wanted. The only attempt at a similar effect in Gothic architecture is at Ely. The central lantern there is beautiful in so far as it follows this arrangement, and fails just because it does not carry it further.

Externally the effect is as happy as it is internally. The breaking up of the external parts gives a play of lights and shades, and a sparkling brilliancy of effect, not to be obtained by any other means that I am aware of, where the salient and re-entering angles give those vertical lines which the Gothic architects sought, somewhat clumsily, to attain by the employment of buttresses and other mechanical expedients.

Fortunately, any one who wishes to form an opinion as to the beauty of this arrangement internally can do so by paying a visit to the Church of St. Stephen's, Walbrook. It is avowedly Sir Christopher Wren's master-piece, and, both on the Continent and in this country, allowed to be one of the most beautiful classical interiors erected in modern times. The success is entirely owing to its architect having hit upon the same idea as the Jaina architect. In some respects it is inferior to his work, but this arises either from the space in the City being limited, or from Sir Christopher Wren not having carried the principle far enough.

It is not only, however, in constructive arrangement that the Indian architects might afford important suggestions. There are probably few things our Gothic antiquarians are so justly proud of as our window tracery; but I question if there is anything in Europe of that class so beautiful as the windows of the Bhuddar at Ahmedabad. There is in them just that admixture of constructive form with conventionalised nature, which makes up the perfection of decoration in all styles; and if those windows were glazed with coloured mosaic glass in that brilliant harmony so general in the East, it would be difficult to match them for beauty in their class from examples in any other style. Besides these, however, there are some hundreds of examples of the same class of decoration at Ahmedabad used merely as ornament, and consequently hardly constructive, but

such as might be freely copied in metal or in terra cotta, and if used appropriately would be more beautiful than anything of the kind we have yet seen.

One other peculiarity of our Gothic style, to which we are accustomed to turn with pride, is the form of the pendants from our Gothic roofs. Those, however, which the Jains in Guzerat hung from the centre of their domes are not only more beautiful in form, but far richer in ornament, and with every detail so exquisitely designed for the place in which it is put, that our Gothic architects must yield the palm to them in many respects.

It would be easy to go on multiplying examples of this sort but time will not permit, and without detailed illustration it is impossible to make the subject understood, and I shall not therefore attempt it. Before concluding, however, let me call your attention to another subject, though its interest is more archaeological than artistic. You have all heard what a bone of contention the age of cromlechs, and dolmens, and menhirs is to our antiquaries, and how much divine wrath the discussion excites in certain bosoms. Now here is a new fact for discussion. In the spring of the present year a surveyor, luckily not a railway surveyor, for had it been the latter the monuments would before this have been utilized, but one employed in the trigonometrical survey, in cutting his way through the Neermull jungle, half-way between Hyderabad and Nagpore, came to a group of cromlechs and crosses, of which he made some photographs and sent them home. The cromlechs are identical in every form with those in Brittany and Wales. The crosses, nine to ten feet in height, are such as might be found in Ireland or in Kensal-green Cemetery. That they are of Christian origin can hardly be doubted, and that they are of the same age as the cromlechs seems a certainty, and that they belonged to the same people. Who those people were, and when they lived, I must leave to others to determine. All I wish to point out here is that it is another point of interest in the study of architecture in India.

Allow me, before concluding, to recapitulate as briefly but as clearly as I can, the principal points on which I have dwelt in the preceding paper, in order that you may see how I have made out my case, or made myself understood.

I consider the study of Indian architecture important because it affords the readiest and most direct means of ascertaining the ethnological relations of the different races inhabiting India. It points out more clearly than can be done by other means how they succeeded each other, where they settled, how they mixed, or when they were absorbed.

In the next place, I consider it important, as it affords the best picture of the religious faiths of the country, showing how and when they arose, how they became corrupted, and when and by what steps they sank to their present level.

It is also, I believe, important because in a country which has no written histories it affords almost the only means that exist for steadying any conclusion we may arrive at, and is a measure of the greatness or decay of the dynasties that ruled that country in ancient times.

These considerations refer wholly to India, and to the importance of the study as bearing on Indian questions only; but I consider it as important also, because of its bearings on architectural art in our own country. First, because by widening the base of our observations and extending our views to a style wholly different from our own, we are able to look at architecture from a new and outside point of view, and by doing this to master principles which are wholly hidden from those whose study is confined to one style so mixed up with adventitious associations as our local styles inevitably are.

It is also important because architecture in India is still a living art. We can see there, at the present day, buildings as important in principle as our mediæval cathedrals erected by master masons, and by the same principle

and in the same manner that guided our mediæval masons to such glorious results.

It also is, I conceive, important as offering many suggestions which, if adopted in a modified form, might tend considerably to the improvement of our own architectural designs.

Lastly, I consider the study worthy of attention from the light it may expected to throw on some of our own archaeological problems.

Besides these seven there are many other reasons that I could urge to prove that the study is worthy of more attention than it has hitherto received; but if I have succeeded in making these at all clear, they are amply sufficient for my purpose. If you feel at all with me on the subject, I need no apology for concluding by saying that if Indian architecture is worthy of study, it is worth while that something should be done to obtain the materials requisite for that purpose; and I do hope that some sort of organization may be got together to collect and bring home such representations of Indian buildings as may render the study easy and accessible to all. A good deal has been done lately, but it has been done without system. Those temples only have been photographed which are situated near to where some artist with the necessary apparatus happened to reside. Many of the most important are still unrepresented. In no instance—except one—have they been accompanied with the plans or measurements or descriptions necessary to make them intelligible, without at least a very disproportionate amount of study. By organisation all these difficulties might be avoided, and with it I think the results would be such as would surpass the most sanguine anticipation.

If anything is to be done it ought to be done quickly, for in a tropical climate like that of India "decay's effacing fingers" work much more rapidly than in a temperate climate. Vegetation there is also an active power, always tending to tear down temples and destroy the most elaborate buildings; and there is a third power more perniciously active than either in the shape of the barrack department, which is fast obliterating beauty in the land. Within the last few years one-half of the palace at Delhi has been pulled down to make way for a regimental barrack. The fort of Gwalior has still more recently been handed over to the department, and everywhere, from the causes above-mentioned, destruction is stalking over the land, so that unless something is done, and done quickly, to perpetuate by representation the forms of those beautiful buildings, it may be too late, and their memory pass away for ever.

As I hinted, when I commenced, might be the case, I am afraid that what I have said has taken rather too much the form of dogmatic assertion, but I appeal from myself to the walls; and I feel sure if any of you will take the trouble to examine, with any degree of care, the photographs there displayed, you cannot fail to be convinced that the study of Indian architecture is worthy of the attention of every true friend of India and of every true lover of art.

DISCUSSION.

Mr. HENRY COLB, C.B., remarked that if anything were wanting to convince Englishmen how much there was in India of which they were ignorant, it was the able paper they had heard this evening. His own impression was that they knew very little indeed of India, excepting what they read in price currents of grey shirtings, twills, cotton twist, indigo, &c.; of the people of India they knew very little; and of their architecture still less. He thought it hardly too much to say that there were scarcely half-a-dozen architects in this country who could pass even a preliminary examination in Indian architecture; and yet here was the great fact before them that there was an architecture, whether beautiful or ugly did not affect the question, which might be said to be the history of a people living in a state of consider-

able civilisation even 500 years before the Christian era. There were so many points presented in the paper that he could only venture to offer a few remarks on one or two of them. He was greatly surprised at the number of photographs exhibited on the walls this evening, and he thought if they wanted a proof of the great value of photography to art they found it now before them. Photography, in representing the human face, did not, perhaps, often make it beautiful, but it certainly gave most accurate representations of architecture and sculpture. That the architects of this country should know very little about Indian architecture was not surprising when they recollected that even within the memory of members not older than himself, they knew very little about Gothic architecture. Fifty years ago nobody knew anything about Gothic architecture, and he remembered being sent to look at the new church of St. Luke's, Chelsea, as something wonderful and novel; and yet they knew how great a revival there had been in that branch of art. If such had been the case with Gothic architecture, he thought that eventually they might hope to have some knowledge, at least, of the architecture of India. Not more than a hundred years ago Horace Walpole built that structure which was then thought to be excellent Gothic, at Strawberry-Hill; and scarcely fifty years had elapsed since Wyatt, in Durham Cathedral, exercised his taste in what he considered to be Gothic; and yet at the present time there was not an architect's pupil who would not consider himself disgraced if he had produced such work. He therefore did not despair of seeing Indian architecture studied in this country, but he wished to be understood that he did not desire to see it copied. While upon this subject he might mention that visitors to Paris next year would see a building in connection with the exhibition there, the design of which was somewhat in the form of a Mohammedan temple, suggested by Mr. Hope's book on architecture. In the English department of that exhibition it had been found necessary to erect a building to contain several boilers, which were the first place to be exhibited as specimens of manufacture, and also to be used to drive the machinery. Of course, in connection with the boilers there must be chimneys, and it was desired to have them ornamental: the building must also be extremely airy, so as to make it as cool as possible. Looking over Mr. Hope's work on architecture they found a representation of a mosque of which Syeed Oosman was said to have been the builder, and this gave them, in addition to extremely ornamental forms, like chimneys, colonnades, which afforded open spaces for the public to inspect the boilers in. It was most remarkable how much influence the display of Indian productions shown in the Exhibition of 1851 had had upon our taste, especially in the manufacture of carpets and other fabrics. Mr. Peter Graham, a competent witness, was present, and could testify to this. Instead of flaring patterns in perspective, they had decorous flat patterns, on which they could place furniture without feelings of discomfort, and it was the fact that a large trade had since been established in Musulipatam carpets. The same influence, he believed, would ultimately be exerted by the architecture as by the manufactures of India. He also remembered that in the Exhibition of 1851, whilst they had these beautiful patterns designed by the benighted people of India, there were beside them some most abominable imitations of European patterns. Indeed, there was nothing so bad as when an Indian attempted to copy European art; and he confessed he had some fear lest the schools of design in Calcutta, Madras, and Bombay, instead of leading the natives to advance in their own styles of art, would create a hybrid style, the most detestable ever seen. In his opinion we had a great deal more to learn from the Indians than we could hope to teach them in the designing of patterns, and he protested against schools of art in India, which should corrupt native talent and taste. He might mention

another point. He read in the *Builder* a little time ago, that for the University of Calcutta it had been determined to adopt the Doric style of architecture. It might possibly be right to have Doric columns in the University of Calcutta, but it could hardly be right that they should be of cast stucco imported from England. Could they conceive anything more likely to debase Indian art than taking cast stucco columns from England to Calcutta? Mr. Fergusson had alluded to the importance of having some kind of systematic mode of collecting information on the architecture of India. He was quite sure, supposing they none of them cared at all about art, they must nevertheless feel an interest in the millions of human beings who were at present subjects of Queen Victoria, and must long to know something about this remarkable people. He would ask how that rude cross and cromlech, shown in a diagram on the walls, could have got into the place where it was described to have been found? It was a veritable duplicate of Kit's Cotty-house in Kent, and yet it was in the midst of a dense jungle. Let them try and penetrate the history of such things as these. Mr. Fergusson had suggested that they should go on systematically obtaining photographic representations of objects of art in India. He (Mr. Cole) hoped some plan would be arranged by which we might be able to have in this country a systematic collection of photographs of Indian buildings; there were already skilful photographers high up the hills in India, who were in possession of thousands of these photographs—and he hoped we should soon see them in this country. He was enabled to state that it was intended that in the Indian court of the Paris Exhibition Indian architecture should be represented. In addition to photographs he would suggest casts. Only the difficulty of cost, which Englishmen very soon overcame, stood in the way of procuring casts of all the typical buildings of India. The public money had been already employed in obtaining casts of the finest objects in Italy, Spain, and France. We had recently imported into this country, at a cost of between £2,000 and £3,000, a cast of the beautiful gate of the convent of Santiago, in Spain; and if we were to have these casts from Spain, it would be well to have them from India also. This was the more important when it was recollected how rapid was the destruction of such works in that country from various causes; and while on this subject he would read the following extract from a work on the architecture of Ahmedabad, which showed how wantonly even those who ought to respect such monuments sometimes treated them:—

“Seedee Syeed’s mosque at Ahmedabad is now built into the north-eastern corner of the modern wall of the ‘Bhudder.’ Its position exposed it in after times to more than usually rough treatment. After being desecrated by the Mahattas, it has been converted by the British into one of the public offices, and has been hacked about to suit official convenience as much as the Chapter House at Westminster. But its principal glory still remains intact in two windows of perforated marble, which may be safely affirmed to be unrivalled through out the East. Their dimensions are ten feet wide by seven high.”—*Architecture of Ahmedabad*, pp. 46, 47.

Though he sympathised with the feelings that would abstain from robbing a country of its treasures, yet he thought when they were converting palaces and mosques into barracks and offices for Government clerks, they might be allowed to put in a word on behalf of saving treasures like those described by Mr. Fergusson, and applying them to more appropriate uses. If the India Museum in Whitehall could not be adequately extended, some other place might be found in which those rich stores of ancient art might be deposited. Members would recollect that in 1852 this Society announced its intention of forming a large and comprehensive exhibition of Indian art. A correspondence on the subject was opened with the Indian authorities, and their late President, the Prince Consort, was consulted, and gave his cordial support to the plan. Various difficulties, however, prevented the realisation of the scheme, and the objects already collected were handed

over to the authorities of the Dublin Exhibition. If the Society would, at a future time, again take up the idea, and hold a complete Indian Exhibition, embracing a proper representation of architecture, coupled, perhaps, with a complete colonial exhibition, he believed a most interesting and valuable display would result. Speaking as a member of the Society, and not as one of the Council, he would urge upon the members, if they took an interest in the subject, to endeavour to get up a thorough representation of the arts and manufactures of India as well as of the products and raw materials of its commerce. On the occasion to which he had alluded, in the year 1852, there was great difficulty in providing a building for the exhibition, but that difficulty would in a year or two be removed. There would then be in existence a building, the great Central Hall, which would be sufficiently large to accommodate an exhibition of this kind, besides a good many other things.

Colonel Scott, R.E., said, as it appeared that the publication of the works by Mr. Fergusson on Indian architecture had been discontinued, he would suggest that, now a much deeper interest was taken in the subject, means might be found to carry on the work to completion. He would also take the opportunity of asking Mr. Fergusson to what extent he considered the architecture of any one of these races of India had influenced the architecture of the race that succeeded it, and whether in the architecture of the present day any purer system was followed, or whether what was styled by Mr. Cole a hybrid character of architecture now prevailed in India.

Mr. Fergusson replied, on the first point alluded to, that he did not feel it to be desirable to resume the publication of the works referred to, inasmuch as photography had so largely supplied the place of the large lithographic drawings by which the works were illustrated. He had, however, in a later work (which was complete, though not yet actually published), gone through the whole subject again with considerable additions. What he would prefer would be to take up the whole subject *de novo*, in a separate work, amply illustrated. The only consideration was that of expense, for such a work would never pay, and it was hard to expect an author to spend his money as well as his time; so that as there was no public fund applicable to such a purpose, the work must remain in abeyance till means could be found to publish it. With regard to the second question, the styles in India had changed like those in this country, but each was a complete indication of the race of people to which it belonged. Each style differed from the preceding one, but was entirely without foreign admixture; and when they were familiar with the whole, the ethnology of the people was distinctly to be traced in the different styles. Where European influences prevailed architecturally, as in Lucknow and Hyderabad, the style had become corrupt and bad to the last degree, and all Mr. Cole had said was not half the truth.

Mr. J. CRAWFORD would not attempt any criticism of the interesting paper read by Mr. Fergusson. Indeed he was not competent to do so; for Mr. Fergusson certainly was the best-informed man in the country on the subject he had brought before them. There were some points, however, on which he entirely differed from him. For instance, the Aryan theory he utterly disputed. Mr. Fergusson would have it that India was chiefly peopled from abroad, but that he (Mr. Crawford) did not believe. He believed that Nature made India a fertile country, and peopled it just as every other portion of the world was peopled. That there had been invasions of India in different ages there could be no doubt, and the invading tribes soon became merged in the native population. Mr. Cole had argued that we knew nothing of India except through the price currents of the markets; but he (Mr. Crawford) entirely dissented from this, and contended that we knew a great deal about India. Mr. Cole had perhaps not made it his study, but many persons had devoted the best part of

their lives to the subject, and ought to know something about it if they did not. The architecture of India was certainly wonderful and curious, though he thought not very beautiful or graceful; and he contended that we were a more advanced people in this respect than those of India. He was not for imitating Indian architecture; but in many respects they might well imitate our architecture, and, for his part, he believed they would improve in proportion as they imitated it. Very much remained to be done in the way of improving domestic architecture in India. Their temples were large and gorgeous, but they had, in fact, no domestic architecture, and their dwellings were mere huts. All that had been done in the way of architecture had been bestowed upon their false gods; and he knew of no Indian architecture except that which was of a religious character.

Mr. PETER GRAHAM ventured to hope that Mr. Fergusson, in addition to allowing his valuable collection of photographs to remain in that room during the Christmas week, would permit them to be further exhibited at the South Kensington Museum for some time longer. It would, he believed, greatly gratify the public and render service to art in an architectural point of view. Mr. Cole having appealed to him with regard to the influence exerted upon the manufactures of this country by the Indian department of the Exhibition of 1851, he had no hesitation in stating he entirely concurred in the views of that gentleman. Followed up as that was by the exhibition at Marlborough-house, for which he believed they were mainly indebted to the personal exertions of Mr. Cole, a great and beneficial influence had been exercised upon the taste not only of manufacturers, but the public at large. He believed he was warranted in saying that in the choicest specimens of ornamentation of the *cinque-cento* period there might be traced an influence derived from eastern objects of art that had been seen by the artists of that period. This could be discerned most distinctly; and he thought they could not do better than study those works—he did not mean as copyists—but as affording suggestions by which taste in the manufactures of this country might be improved.

Mr. ROBERT RAWLINSON, C.B., said that when he looked at the numerous photographic representations of these buildings on the walls of the room, and while listening to the eloquent remarks of Mr. Fergusson with regard to them, he could not but ask himself the question—what was the purpose and utility of such large structures as these? And when they were called on to admire them as beautiful pieces of construction, they could only do so by considering the kind of people who constructed them, the climate in which they were placed, and the purposes they were applied to. He must express his opinion that architects even at the present day did not sufficiently consider what were the purposes for which their buildings were required. Huge public buildings were erected, and subsequently certain “dodges” had to be resorted to make them habitable. That was especially the case in the Treasury-buildings, where all sorts of contrivances were resorted to to produce ventilation; and looking at the outside of the houses in London generally, they could not but notice all kinds of hideous appliances employed to induce the smoke to go up the chimneys. As a sanitary engineer he felt that before they went to the study of Indian architecture they should learn to perfect their architecture at home, and make it really useful. Looking at the representation of the great Dravidian Temple (p. 72) he had no hesitation in saying, in a sanitary point of view, it was an abomination, though possibly it might have architectural merits. It could not be lighted as it should be, nor could it be sufficiently ventilated. At the same time many valuable lessons might be learned from the East, especially their mode of making and arranging tiles, of using mortar, and of construction generally. The employing architects and engineers, and allowing them to send out ideas from this country for use in India, was an enormous waste of the public money. He knew that many

things sent out from this country to India served no better purpose than affording a good commission to the parties who gave the orders for them. In water-works construction it was evident that the Hindoos were in advance of us. There were reservoirs in India, 2,000 years old, and we might learn a lesson from them in this respect. A water supply, however, was about to be provided for Calcutta by a conduit 14 or 15 miles in length, from the Hooghly into the city. It would hardly be believed that that conduit was to consist of cast-iron pipes, sent from this country, to be laid in a marshy subsoil full of salts, where it could only last about twenty years. If that conduit had been built of Hindoo bricks, by Hindoo workmen, it would have been executed at half the cost, and might have lasted 2,000 years. He happened to know that in India there was a vast deal to be done in the way of building, of various kinds, for years to come. There was an army to be maintained at less cost of life than was the case at present, and several millions of money were to be spent in providing adequate barrack accommodation and improving the military stations of the country. He did not think it was a wise step to turn attention to these disused temples for hints as to the best mode of construction, but he did think the works should be constructed of native materials and by native labour, though upon the best plans that modern civilization could suggest.

Mr. J. BEAVERINGTON ATKINSON said the subject introduced this evening suggested one or two inquiries. The first was how far the Mohammedan architecture, of which there were such beautiful examples in the room, could strictly be called Hindoo. The date of that architecture was 1200 of our era. They were perfectly well acquainted with it in other portions of Asia, and also in some parts of Europe. They knew what it was in Cairo and Constantinople, and also in Spain. The Mohammedan architecture which they found in India was, he ventured to say, except in some minute details, that which was known as Arabian architecture planted in a new soil. They had the glorious dome and pointed arch peculiar to that architecture, which gave it a significant character wherever it was seen. Then, with regard to the ethnology of architecture, that was a very vague and conjectural term, and he ventured to ask whether, in order to get at anything like the origin of Indian architecture, they must not go back to a date far anterior to that of the oldest building represented by these photographs. If he had rightly read the works of Mr. Fergusson he believed the earliest building of which they had a record was something like 250 years before Christ, whereas Thebes and Memphis were supposed to have been founded 2,000 years before Christ, and Rome 750 years; whilst the great period of the Greeks was, he believed, nearly cotemporaneous with some of the photographs exhibited. Therefore, he would ask Mr. Fergusson how much further it was possible to go back in chronology in order to arrive at the ethnography of the arts of India, and whether between the eastern and western architectures there could be traced any correspondence as to the details. As to the exact merits and position of Indian architecture it would be presumption in him to offer an opinion. One criterion of merit in architecture was the relative perfection of the figures employed in decoration. Supposing these buildings to be contemporaneous, or nearly so, with the Greek temples, their artistic position would be somewhat indicated by the drawing and modelling of the figures in these façades as compared with the great Grecian works of art.

Mr. PHILIP PALMER remarked that the late Sir Joseph Paxton, in his plan of the exhibition building in Hyde-park, illustrated the principle of building by the multiplication of parts, but if he understood Mr. Rawlinson rightly, he appeared to think that a building of that form could not be well lighted and ventilated. They could hardly expect glass to be used in such structures

in India; but it had been shown that in this country it was possible to erect buildings on that principle and at the same time to secure thorough lighting and ventilation.

Mr. FERGUSON, in reply upon the discussion, said Mr. Rawlinson laboured under a mistake in the views he had expressed relative to the square form of temple he referred to. It was impossible within the limits of a paper to point out all the details, but there were no separate apartments in the building, as Mr. Rawlinson had supposed, but the building, of which the plan was given on p. 74, was in fact a vast porch, standing on 56 pillars, and was perfectly open, the ventilation being of course admirable. The Dravidian Temple belonged to a different style of architecture and a different age altogether. He had endeavoured to make it clear that he by no means wished these productions to be copied. All he said was that there were principles in these buildings which were worthy of the study of architects, and it was by going to foreign styles, where they were not hampered by association, that they could most clearly understand what the true principles of architecture were. With regard to the remarks of Mr. Crawford, as to the absence of domestic architecture in India, that gentleman must surely be aware of the existence of numerous large and beautiful palaces which, in point of form and ornamentation, were equal to anything in Europe. In reply to the question of Mr. Atkinson, as to how far Mahomedan architecture was Hindoo, and why he had applied the term Mahomedan to it, he would refer to the circumstance that when the Mahomedans went to Constantinople they did not take with them the architects of Cairo, Syria, Spain, or Persia, but they literally copied the church of St. Sophia, which they found there, in the works which they erected in that city. Wherever the Mohammedans went they introduced no style of their own, but employed the native people to build their mosques for them; and this accounted for the fact that some of the most beautiful Mahomedan buildings in India were purely Hindoo from first to last. With regard to the ethnography of the buildings, he could not in India get beyond 250 years before Christ, but, as far as general knowledge on the subject went, from the building of the first pyramid in Egypt down to the present day in India, and down to the 13th century in Europe, there was not a single building which did not more or less mark the ethnography of the people who built it. What gave the architecture greater interest was the fact that they could trace this ethnological relation not only in India but also in Africa and China, and other parts of the world. Indian architecture itself formed but a small branch of this subject, though a pleasing and important one, because, from the want of inter-communication, they retained their peculiar idiosyncracies to a larger extent and more distinctly than any other people he knew. With regard to the request made by Mr. Graham, he should be happy that the photographs should go to South Kensington; but he hoped before long there would be a better collection in that establishment.

Sir THOMAS PHILLIPS, Q.C., said, before the closing of the discussion on the admirable paper they had heard, it might not be inappropriate to the presence of the chairman (Sir James Fergusson) that the meeting should pronounce what he was sure they all felt, viz., that it was the duty of the Government of this country to do what in them lay to preserve as far as possible the recollection of those great architectural works throughout our Indian dependencies. Without entering into the disputed question of how far those buildings were really beautiful, there seemed no doubt that, as the rulers of a great people, who had occupied a territory extending over a considerable part of the globe for a period of 2,000 or 3,000 years, it was the duty of the British Government to preserve, as far as might be, the memory of those great and distinctive works of art. Happily, we were in possession of an art which enabled

us to preserve the representation of these great monuments at small cost and with great accuracy; and he could not doubt that means would be taken for obtaining, especially by means of photography, such memorials as might be regarded as objects of real national interest. Mr. Fergusson had intimated that he had been asked to deliver a series of lectures on this subject, but had felt it necessary to decline doing so, from a conviction that he could not, in the limits of four lectures, bring before the public that accurate view of India which he desired; but four lectures would surely do more than one. They had listened to one with the greatest interest, and all who had done so, he was sure, would desire that it should be multiplied. He appealed to Mr. Fergusson, on account of his known devotion to the subject, the thorough love he had for it—and he could appeal on no higher motive—to gratify the Society by giving a course of lectures on Indian architecture.

The CHAIRMAN said the evident interest with which the meeting had listened to the very valuable paper which Mr. Fergusson had delivered, made him feel that it would be a mere matter of form on his part to propose that the meeting should accord their most grateful thanks to that gentleman. But he could not omit the opportunity to say how greatly the gratification he had felt at the honour conferred upon him, in being invited to occupy this distinguished chair, had been enhanced by the deep interest he had felt in listening to Mr. Fergusson's paper. It was certainly an unusual thing for an Under-Secretary of State for India to vary his ordinary duties, which he hoped were not altogether useless, by attending such a meeting as this and hearing such a subject discussed. He was usually confined to the drier matters of how to make Indian railways pay; how to pay the public servants in India; and too often perhaps, how not to pay them. In some of the speeches delivered this evening, rather pointed allusions had been made to the responsibilities of the home government of India, in which he had the honour to hold a humble position; and some slight imputation was cast upon the government on account of what were considered breaches of taste in connection with public works in India. It should, however, be remembered that the government of India was mainly conducted in that country; and not only were the public works promoted there, but the duty of preserving the ancient monuments of the country must be discharged by those who were on the spot. Great as the influence of this Society was, there were kindred societies in India, which showed that Europeans in that country were not unmindful of the subject which had been treated this evening; and the Society at home might be doing wrong in taking the matter out of their hands, inasmuch as through their agency, working through the government of India, they might accomplish the end in view. Undoubtedly it was desirable to possess authentic records of these monuments of ancient times, but it might be a question, with those who had to administer the scanty revenues of India, as to how far the public funds should be devoted to such a purpose. He ventured to think that if they wished to obtain these records from India, it could only be done for the most part by private enterprise; at the same time he was quite sure that the men at the head of the government were far too enlightened to be unmindful of these works of art, and that they would only be too happy to facilitate opportunities for procuring the memorials referred to, for any benefit thus conferred upon the arts in this country would be reflected back upon the people of India themselves. He believed the more the people of this country—especially the educated and learned classes—were led to bend their thoughts towards that great dependency, which involved such deep responsibilities upon ourselves, the greater would be the amount of benefit to the people of India; and he hoped that indirectly this might be the means of attracting more of the capital of this country to the development of the commercial re-

sources of India, while at the same time our rule there was not unmarked by attention to those arts which refined and civilised mankind. He was sure he carried with him the feeling of the meeting in tendering to Mr. Fergusson their cordial thanks for the paper he had favoured them with.

The vote of thanks having been passed,

Mr. Fergusson, in acknowledging the compliment, said, in answer to what had fallen from Sir Thomas Phillips, that on the present occasion he had made no attempt to describe the architecture of India, but only to illustrate two or three principles, which he thought would show the importance of the study. He had just completed a treatise on the subject, which would form a considerable portion of the second volume of his "History of Architecture," and he hoped that by this means, and by promoting the production and exhibition of photographs of the principal works, to do more to promote this study than he could hope to do by a course of lectures such as Sir Thos. Phillips had asked him to deliver.

PAYMENT OF FEES BY STAMPS.

In consequence of the Act which provides for the collection of fees in public departments and offices, by means of stamps, the Lords Commissioners of the Treasury give notice, with respect to the Companies Registration Office, that from and after the 31st day of December, 1866, the fees payable in that office shall be collected by means of stamps; and they direct that the following rules be observed:—

1. The stamps to be used for collecting the fees payable to the Registrar of Joint-stock Companies shall be procured and paid for by the persons liable to pay such fees.

2. All documents tendered for registration shall be according to the proposed forms, and bear an impressed stamp denoting the amount of fee payable for the same.

3. Where any such fees are payable in respect of any thing to be done in the Companies Registration Office, the person requiring such matter to be done shall make application for the same in the form kept for that purpose in the office, and an adhesive stamp denoting the amount of the fee so payable shall be affixed to such form of application.

4. On the necessity thereof being proved to the satisfaction of the Registrar, with his consent, the stamp denoting the amount of the fee payable may be either impressed on or affixed to any copy, second certificate, or extract so applied for in lieu of being affixed to the form of application.

5. All adhesive stamps affixed to any paper presented to, kept in the possession of, or delivered out by the Registrar, shall, before the Act is done in respect of which the fee denoted by such stamp is payable, be cancelled by some officer in the office of the Registrar.

6. That when any stamp has been cancelled without having been legitimately used, and the Registrar of Joint-stock Companies has granted a certificate that any particular stamp is a fit subject for allowance, it shall be competent for the Board of Inland Revenue to allow the amount thereof.

PUBLIC WORKS EXECUTED IN PARIS DURING THE PRESENT YEAR.

As the time approaches when masons' work must be suspended for the season, it is natural that the chroniclers of Paris should take reviews of what has been done for the improvement and beautifying of the city during the current year, and the list of works completed or under hand is surprisingly long.

In the old city, the Isle de la Cité, the restoration of the noble pile of Notre Dame has been terminated after a labour of twenty or more years, the handsome new

building, or Palace of the Tribunal of Commerce, has been completed, the enlargement and improvement of the Palais de Justice has been pushed forward, the old Conciergerie and the Prefecture of Police, forming parts of the great pile the construction of which was commenced by Charlemagne, have been almost rebuilt, large new barracks have been erected, between Notre Dame and the Palais de Justice, for the Garde de Paris, with new buildings for the staff of the *sapeurs-pompiers* (military firemen), and that of the municipal guard, and an immense mass of old houses has been demolished to make room for the new hospital of the Hôtel Dieu, the walls of which are beginning to appear above ground. Little now remains of the interesting, romantic, dirty, and unhealthy *cité*, the heart of Paris for so many centuries, and still the Paris of the historian, the poet, the novelist, and the antiquary.

On the left bank of the Seine, large additions have been made to the station of the Orleans Railway, an *ouvroir*, or workhouse, by the Board of Public Charity, the continuation, still in progress, of the circular railway round Paris, the building for the Universal Exhibition next year, the completion of the great trunk sewer, and a church and market at Montrouge.

It is on the other side of the river, however, that the most extraordinary changes have taken place and the most important works have been executed or commenced. The corner tower of the Tuileries, called the Pavilion of Flora, with its remarkable sculpture, has been completed, a large portion of the gallery which connects the Tuileries with the Louvre has been rebuilt, and the remainder is in progress, and the spire of the Hôtel de Ville has been reconstructed: the heights of the Trocadéro have been completely changed, and a great Place formed there opposite to the Exhibition building, and the work is now being continued over the old village and quarries of Chaillot, an enormous undertaking; connected with this new Place, named after the Roi de Rome, the son of Napoleon the First, are the grand avenue of the Emperor, and the avenues of Josephine and Alma; in another part of the town the great Boulevard of Magenta has been opened from the Château d'Eau on the main boulevards across the Boulevard de Strasbourg and the old suburb of Clignancourt, by the foot of the hill of Montmartre, and across the plain of Saint Denis to Saint Ouen, a small town on the banks of the Seine, in a straight line for four miles; a wide street has been opened, and houses are in course of construction between the Pont Neuf and the great central market of Paris, and two other streets have been made in the same quarter; the completion of the great market itself is progressing rapidly, and the whole will be finished in a year or so; three streets have been opened up in the old dense neighbourhood of the Faubourg Poissonnière; a long street, called the Rue de Puebla, has been pierced from La Petite Villette to Charonne, in order to open up the sites upon which is being formed the new cattle market and abattoirs of Paris, and the park of the Buttes Chaumont.

Amongst special buildings which have been partially or wholly built are thirty schools, five new churches, eight other sacred edifices repaired, and two new mairies. The Great Northern Railway Station, one of the largest in Europe, has been completed. An ornamental garden has been formed around the Expiatory Chapel, which marks the spot where the remains of Louis XVI. and Marie Antoinette were concealed by the royalists until the restoration, and which had been opened up by the formation of the Boulevard Haussmann, which, also, has been completed this year. The great circular Place de l'Europe, the converging point of six streets, named after six European capitals—London, Berlin, St. Petersburg, Constantinople, Madrid, and Vienna—has been entirely removed, and replaced by a six-way iron bridge over the Western Railway, which formerly was tunnelled below, and a fine new street, called the Rue de Rome, has been constructed parallel with the railway; the works neces-

sary for the widening of the railway at this point, and the formation of the street in question, had to be carried through solid strata of stone, in some places as high as a three or four story house.

The buildings of the Conservatoire des Arts et Métiers in the Rue St. Martin have been much enlarged, and some curious old buildings in the neighbourhood uncovered and brought to light. The compound bridge over the Seine at Auteuil, for the Circular Railway, has been finished; two or three markets have been rebuilt, on the plan of the great central Halls; the Bank of France is being enlarged and beautified; and many other public buildings have been under the hands of architects and builders. In addition to all this, the ancient outer boulevards, which form a circle around Paris of about sixteen miles in extent, have, to a great extent, been metamorphosed, widened, planted with trees, and will eventually form a grand promenade, with two roads for vehicles, a ride in the centre, and wide avenues for pedestrians.

Such is a hasty sketch of the works completed and carried forward in the city of Paris during the present year, and certainly neither ancient nor modern history can produce a parallel case. The map of Paris has been almost re-made, and no question of cost, convenience or interest seems to have been allowed to stand in the way of the completion of the work.

One arrangement, rendered extremely necessary from the great width of the streets and open places in Paris, has been borrowed from London, namely, the establishment of refuges for foot passengers at dangerous crossings; the form adopted is a large paved circle, with a handsome candelabrum of four or five lights arranged in a pyramid in the centre, and so great are some of the spaces formed by the intersection of wide boulevards, that in some instances two and even three refuges have been constructed in one open space.

Manufactures.

THE CULTIVATION OF THE MULBERRY TREE.—The following information on the cultivation of the mulberry tree in the kingdom of Siam will not be without interest. It is chiefly in Laos, or the kingdom of Lieng-Mai, a tributary to Siam, that the rearing of silkworms is carried on on some scale. The greater part of the silk produce is employed on the spot by native industry, so that very little of it comes to the Bangkok market. The annual export of this product does not exceed 50,000 kilogrammes (50 tons). Of late years several lots of it have been shipped for Europe. The Laos silk is of an excellent quality, but the means used for spinning are very imperfect, so that this product is placed amongst the inferior qualities. The Anamese, who are established in the neighbourhood of Bangkok, rear silkworms, but in small quantities. They understand the method of their treatment better than the inhabitants of Laos and Cambodia, and their products are better able to compete with the good qualities of China and Japan; but the whole of the silk produced by them is used for domestic purposes, and none is found in commerce. The mulberry is the object of special care in Laos and Cambodia; but it equally succeeds in all the Siamese provinces, and the rearing of silkworms might be successfully carried on there, as proved by the attempts at Bangkok, which is less advantageously situated. It appears up to the present time that no epidemic disease has made its appearance either in Laos or in Cambodia. The Anamese employed in the rearing of the silkworms from eggs from Laos have observed that after that they have been reproduced three or four times a fresh stock should be obtained; this, however, seems to indicate a germ of disease. Should the worms a few days after hatching seem ill and not likely to succeed, the air is changed by taking them somewhere else; this often pro-

duces the desired result. If some crops are lost it is not due to the epidemic. The eggs are transformed into cocoons at the end of a month. Three or four crops of silk are usually produced yearly, during the months of May, June, July, and August. They can be reared during other months of the year, but with less success.

SPECTACLES.—The manufacture of spectacles appears among the Birmingham trades as early as 1784, and was doubtless carried on some years earlier. The "goggle spectacles" of our grandfathers were made here in large quantities, and the patterns remained unchanged till about 60 years ago. Even as late as 1820 hampers of spectacles were sent away like packages of nails or chains, to be distributed throughout the country. The frames were large, thick, and clumsy, mostly of some sort of white metal, varying according to price. As soon as steel wire became adapted for spectacles, a lighter and more elegant article was produced. At present there are at least ten manufacturers engaged in making spectacles, and about 200 hands are employed, Birmingham being the chief seat of the trade. Women and girls are employed chiefly in the manufacture of spectacles. The making of the light steel frames, now popular, and of the silver and gold frames, too, employs men and boys, while the grinding of the glasses and the fitting-up of the spectacles is frequently done by women and girls. Over 3,000 pairs of spectacles are made at Walsall weekly.

AGRICULTURAL IMPLEMENTS.—It is estimated that the iron consumed in South Staffordshire in iron fencing, farm gates, hurdles, and such like articles used for agricultural purposes exceeds 10,000 tons per annum, as upwards of 4,000 tons are consumed by one firm alone, and many other manufactories of similar articles have sprung into existence of late years in the neighbourhood of Wolverhampton and Bilston.

Commerce.

NEW SYSTEM OF PICKLING VEGETABLES.—Some experiments have recently been made by Messrs. Burgess and Sons with some newly-invented machinery which that firm have erected for working Manfield's system for the preservation of vegetables. The novelty of the new process consists in its effecting in a few hours, by means of atmospheric exhaustion and condensation, that which has hitherto taken months to accomplish. The machinery consists of a large air-tight chamber or receiver, capable of containing 100 gallons of vegetables, fitted with two sets of air-pumps for exhausting and condensing the air in the receiver; an air-tight tank to contain vinegar communicates with the receiver, the whole of the machinery being worked by a Lenoir gas-engine. The metal parts of the machine with which the vinegar comes into contact have been made exclusively of platinum. The method by which the pickling process is attained is as follows:—The vegetables are placed in the receiver under atmospheric pressure; all superfluous moisture is expressed without in any way injuring them. The air is subsequently exhausted by means of the vacuum-pumps, when spiced vinegar is admitted and forced into the fibres of the vegetables by an atmospheric pressure equal to 45 lb. to the square inch, or about three ordinary atmospheres. When this operation is over, the pickles are found ready for the table. The patentee of this system of preserving does not claim the merit of having invented any new principle, as a somewhat similar plan has been used in creosoting railway sleepers; he merely claims the novelty of having utilised for practical purposes the well-known air-pump experiment of exhausting the air from a piece of wood and impregnating it with mercury. The method of pickling hitherto employed has been to cut up the materials and then simply cover them with hot or cold spiced vinegar, trusting to time for it to soak in, which process takes some months before the vegetables lose their

natural rawness, and acquire the desired flavour. This is the home-made plan, but it is said to be seldom employed commercially, as the wholesale manufacturer has often to keep hundreds of hogsheds of vegetables for months; and as the capital lost by keeping such a quantity in vinegar would be large, brine is the medium they are kept in until required for pickling; but as the strongest and best vinegar made is not sufficient to counteract the effects of the salt absorbed by the vegetables kept in that manner, acetic acid is used for the purpose of neutralising it, after which the pickling proceeds in the ordinary manner.

STEAM NAVIGATION IN NORWAY.—The competition between the English and Norwegian steamboat companies, whose vessels run between Christiana and Hull, has given a great impulse to steam navigation in the first of these. Considerable cargoes follow each other each week at excessively low freights. Should this state of things continue for some time, it will have the effect of lowering the price of a great number of goods. There are weekly six vessels on the Christiana, Hull, Copenhagen, and Lubeck lines, to which have been lately added three steamers that run fortnightly between Christiana and Hamburg, and between Christiana and London.

GOLD MINING IN ITALY.—It cannot fail to be encouraging to those interested in the development of the Italian gold mines to find that the returns continue to increase gradually. Another remittance from the Pistarena, Vallanzasca, and Val Toppa mines has been received, amounting to about 1,357 ozs. of fine gold, of the value of about £4,400. The yield per ton of the Pistarena ore, treated during fifty-two days, has been over 2 ozs. of gold per ton of ore. This mine has now returned, since April 1st, upwards of £9,000 worth of gold.

Colonies.

QUEENSLAND.—The total imports for 1865 amounted to £2,505,559, which is an enormous amount, considering the smallness of the population, which clearly shows that the taxation of the colony was not very large, or so much would not have been imported. The total cash receipts, in 1867, are estimated at £847,540 from revenue proper—the actual expenditure would be £688,919. Considerable discussion upon the statement and the proposed tariff took place, the members representing town constituencies contending that the new duties would fall heavily upon the poorer classes and scarcely touch the squatters. Sugar-growing is making good progress in the colony of Queensland. An increased quantity of land is being planted on the shores of Moreton Bay, both at the Cabulture in the north, and the Logan, Albert, Punpana, and the Nerang rivers, on the south of the bay. At various places on the coast new plantations are being established. On the Mackay River alone there are six estates on which upwards of 160 acres are already planted, and ploughing was proceeding vigorously. On the Mary River some extensive machinery has recently been erected, the settlers there going into sugar-growing with a will.

LEGISLATION IN NEW SOUTH WALES.—A bill introduced into the Colonial Parliament to remove restrictions in distillation has been thrown out on its second reading by a majority of 22 to 17. Its object was to relieve the growers of Australian produce generally from disabilities under which they at present labour. At the present time the owners of vineyards may distil for the purpose of fortifying their wines to a certain extent, but they cannot bring into the market the spirit they produce, except in that way, and thus there is annually wasted a large quantity of produce which otherwise might be utilised. The Government objected to the measure, on the ground that it would destroy the revenue and lead to great demoralisation. But while they would not re-

move the restrictions to distillation in regard to the whole range of colonial produce from which spirit can be obtained, they were willing to make provision for allowing the wine-maker to place his surplus brandy in bond, and thus bring it into the market. A bill has been introduced by the Colonial Treasurer to permit the sale of brandy distilled by the owners of vineyards from grapes the produce of such vineyards. It was read a second time without opposition, and has passed through committee without amendment. Several very useful measures have been introduced by the Hon. Minister for Lands. One of these is to provide for the prevention and cure of diseases in sheep. Some years ago, as many as 300,000 sheep were diseased at one time. It was with great satisfaction, therefore, that the announcement was received not long since that the flocks of this colony were entirely free from scab. It is believed that by passing the measure now introduced, it will be possible to check the spread of diseases should they unfortunately again appear. A kindred measure relates to diseases in cattle.

Publications Issued.

THE ILLUSTRATED RECORD AND DESCRIPTIVE CATALOGUE OF THE DUBLIN INTERNATIONAL EXHIBITION, 1865. By H. Parkinson and P. L. Simmonds. (*E. and F. N. Spon.*)—This work, which contains two hundred and fifty illustrations on wood, stone, and steel, photographs, &c., is published under the sanction of the executive committee, and is an elegantly got up volume, extending to nearly 600 pages. It comprises a large fund of important information on the industries of Ireland, and the progress made in manufactures since the first International Exhibition in that country. Besides special reports of the juries, there are valuable preliminary reports on the industrial, colonial, and fine arts departments by the several superintendents, and interesting sketches by gentlemen who visited different foreign courts to promote the objects of the exhibition. The statistical and general official information of the results of the exhibition, as compared with the different ones that preceded it, will prove of importance at the present time to all those officially engaged on the Paris Exhibition.

LITTLE EXPERIMENTS FOR LITTLE CHEMISTS. By W. H. Walcott, F.C.S. (*T. J. Allman.*)—This work is intended to give a systematic direction to those desirous of chemical experiments which young boys so constantly delight in. Each experiment is most carefully detailed, and the most minute directions are given, in every case, for performing the experiment, followed by a description of the result that should be effected, and how it takes place. The work is thoroughly elementary and unencumbered with any but the commoner chemical terms. A lad thus becomes accustomed to dealing with chemical substances, and by the time he has gone through the book is in a favourable condition for commencing the systematic and scientific study of chemistry.

HISTOIRE DES CONNAISSANCES CHIMIQUES. By M. Chevreul. Vol. 1. 8vo. Paris.—Anything coming from the pen of so celebrated a chemist as M. Chevreul is sure to command attention, and the volume of which the title stands above is the herald of a very important work, a complete history of chemical knowledge. M. Chevreul's object is the production of a solid and systematic work—not a popular one; and he has commenced his labour by a very complete introduction. This preliminary volume is divided into five books. The first treats of the general notions of natural philosophy, in which the writer makes known his own views respecting controverted theories and definitions; the second is a dissertation upon the province of chemistry; the third treats of the connection of chemistry with the history

of living beings; the fourth, and most remarkable, book presents a general view of the whole round of the sciences; and the fifth deals with man himself, as the constructor of the sciences, that is to say, on the methods by which his faculties have worked to that end. The volume, which is but the *avant-courier* of a great work, might almost have borne the title of the connection of the sciences.

Notes.

PARIS EXHIBITION.—Among other speculations and novelties proposed to be sent to the Paris Exhibition from Brazil the following are named:—A large collection of Indian and other native weapons and utensils for the chase and fisheries, native dresses, the dried powdered flesh of the large native fish, much used as food, the *piacura*, guarana, a kind of native chocolate, obtained from the fruit of the *Paullinia sanbilis*, and the trade in this, owing to a foreign demand, has, of late years, reached a large extension; specimens of paper, made from maize, bananas, and other indigenous fibres, of which the supply is unlimited; tucum, a fibre obtained from the leaf of a palm, much used for making hammocks; another fine and strong fibre, called curana, is much used for the same purpose, and especially by the Indians for the strings of their bows. It is obtained from a species of *Agave*, a plant allied to the pine-apple, and although very abundant, has yet no commercial value as an article of export. An extract of Paraguay tea is now used in place of the yerba, or powdered leaves and branches of the tree. Dr. Ubatuba, who prepares this, has also given his attention to an *extractum carnis*, by a process of his own, which he is carrying out on a large scale, and which is said to be preferable to and cheaper than that adopted in Uruguay. From Bahia there will be sent a collection of 104 specimens of barks suited for dyeing and tanning. Local exhibitions have been held in the chief towns of all the provinces of the empire.

SUBSCRIPTIONS IN AID OF THE SUFFERERS FROM THE LATE FLOODS IN FRANCE.—The subscriptions collected for the relief of the most necessitous sufferers from the late inundations throughout France amounted at the end of last week to 3,221,155 francs, or £128,846. This is a large sum considering the many demands that have of late been made on the charity of the nation, and the losses that have been sustained by the failure of the silk crop, the sad condition of the silk trade, and the devastations of the locusts in Algeria; the lists are not yet closed.

THE ORPHAN ASYLUM OF THE PRINCE IMPERIAL.—The annual report of this valuable institution, which has been described in the columns of the *Journal*, has just appeared, and shows what valuable service it has done for the poor children of Paris. Since its creation the directors have received contributions from private persons to the extent of more than £12,500, the subscription during the past twelve months alone having exceeded £1,200. The augmentation of the revenues of the Orphelinat has allowed the council to extend its benefits, and 99 children have been admitted since November, 1865; of these more than one-third were made orphans by the cholera; the Empress, having visited the hospitals of Paris, expressed a desire that the doors of the asylum should be open to all the male children whose parents were victims of the epidemic; a committee was charged with the duty of collecting the necessary funds, and seeing the wish of the Empress accomplished. The object of the institution is first to instruct orphan boys, and afterwards to place them to learn a trade, and watch over them until they are of an age and in a condition to take care of themselves. Since the establishment of the asylum, ten years ago, more than five hundred children have been admitted, and although

they were the offspring of parents who, in most cases, died early, either from weakness of constitution or overwork, there have only been thirty-one deaths; during the current year, out of 335 pupils and dependents on the institution, there have been but three deaths, which is evidence of the sanitary condition of the establishment. The maximum age of admission is limited, in practice, to eight years, and the actual average age is seven years eight months. The trades to which the lads are apprenticed are principally those of the cabinet maker, blacksmith, shoe maker, tanner, engraver, watch maker, painter, and engineer; eleven pupils out of the whole number sent out of the school into the world have preferred the army and navy. Twenty-four children were admitted into the asylum the other day on the occasion of the Empress's birthday. It will be seen that the asylum is not yet a large establishment, but it is an admirable institution, and will doubtless go on increasing in importance and usefulness.

Correspondence.

LIMITED LIABILITY.—SIR,—Having been present at the reading of Mr. W. Hawes' paper on the 28th ultimo, "On the effect of Limited Liability on Commerce," and heard part of the discussion thereon, allow me, as a former mercantile man, to state my ideas of the cause of the disastrous results of many useful undertakings. 1. In the declaration of railway dividends, instead of making the capital £100 to vary with the small differences in dividends on this very magnified scale (i.e., if we couple 5 per cent. with £100, 8 per cent. marks £100, 10 per cent. is £200, 4 per cent. is £80), which has been one great cause of changes in fortune, it would have been far better to declare £5 or £6 per annum the interest on the original £100 subscribed, and give the extra dividend as a return of part of the said £100, thus:—The original holder receives £8 per cent.—that is £8, and £2 back—£98 remains; the £100 share is now only £8 per annum and £98 to be returned; at 9 per cent. dividend (or £8 above £8) remains £95 and £6 per annum; at 10 per cent. dividend (or £4 above £8) remains £91 and £6 per annum; thus, granting a stability in the price of this first-rate investment for the small savings of the middle classes. For *primâ facie*, what ought to be securer than land and houses, and ready money business, passengers' fares, &c.? Also Parliament should only consider whether the capital laid out in a novel undertaking is too exhaustive; thus, e.g., had the Liverpool and Manchester Railway been for ten millions of pounds per statute mile, this should have been rejected; but as the total for 30 miles was only £800,000, which might be the damage to our war or mercantile marine afloat in a great hurricane—this amount expended on land in this country should not have met with opposition, in consideration of the probable uninterrupted communication during the whole year, and new methods of field-draining, quarries, &c., that might be discovered, independently of the creations of genius which Parliament cannot direct. 2. As regards the banks, one fruitful cause of distress is the destruction of the salutary control exercised by the honest and capable banker and bill broker. Formerly, the foreign merchant got his bill discounted by the said broker, say at $\frac{1}{2}$ per cent. under the Bank of England current rate, and the said broker rediscounted it at $\frac{1}{4}$ per cent. under the bank current rate to the capitalist, who kept it till it was due. If paid, another amount was taken by the broker from the merchant; if not, the credit of the latter was diminished, if not stopped. Now, to save these little per-centages, merchants are directors of joint-stock banks; the partner of a firm and director of a bank tells his brother directors "they may safely discount for ten times the old

amount presented by the firm;" and if the speculations of the firm turn out unsuccessful, we have widespread ruin, and the goods assets of the firm are bought at a reduced rate by others, who would otherwise have gone to the regular producers. It has happened too often that the bulk of the joint-stock bank capital has been lent to one house alone. 3. The manager of a private partnership of a few partners can say to them, "I have only made 7 instead of 12 per cent. of your capital this year." They will reply, "We manage to live at the rate of 6 per cent., so that we are not losers, and approve of your caution." But the joint-stock manager, who has so many little shareholders to please, with their £20, £30, £50, and each with a vote, knows these men will not be satisfied with a reduced rate, having once launched into the luxuries which a 10 or 12 per cent. dividend will give them. And, in fact, the 16 per cent. dividend is generally made up of the legitimate 5 per cent. on capital subscribed, and the 1 per cent. turn of the market on the tenfold deposit amount. 4. In undertakings such as the Great Ship Company, which came out in £1 shares, is it not commercially absurd to intrust such a vast professional structure to the fostering care of petty tradesmen, who know nothing of the technicalities of the shipbuilding and shipowning trade, instead of seeking at least £100 shareholders? In Prussia, there is an official director attached to the company's board, to see that the other directors do not extravagantly squander the shareholders' money; also an official executor to every estate, who receives from the family executor the realised assets, and takes charge of them for the minors and absentees—similarly to our Accountant-General in Chancery, but with much less expense and circumlocution. Had proper unanimity been observed, and a uniform charge of 3d., 2d., 1d. per mile established, we would not have in provincial towns competing railway lines running for miles close to each other, and with separate stations, involving expense and trouble for passengers and goods in traversing a short distance in a country town to go on another line of rails (e.g. Leamington). Would it not be better for the working classes to establish streets of three-floored houses within a walking distance of their workshops, than to tempt them by daily pennyworths of railway ride, which in hard times would have been found some little alleviation of distress? I would respectfully but strongly recommend that the small insurances from £50 to £100 on tools and furniture should be favoured, especially for the young and newly-married workmen. The premium, even loaded with Government duty, would only require them to keep quietly at home one or two Sundays in the year, instead of spending the same amount of Government duty in taxes on beer and gin. In case of fire, &c., they would get their cash to replace their furniture, instead of going to the tally-shop; which is not so urgent for the elder class of workmen, who have their £100 or £150 in the savings-bank at hand in case of a calamity by fire or water. I have just jotted down these few ideas, which have been many years present to my mind, as effectual remedies against some of the disasters that unlimited reliance on shareholders' capital has produced. Thus, if a Rothschild leaves at Jones Lloyd's a balance of £500, and a little Mr. Smith £2,000, Jones Lloyd traded on £2,500; but in a joint-stock company the manager trades on the Rothschild millions and the Smithian thousands—the key of subsequent ruin to all shareholders.—I am, &c., S. M. DRACH, F.R.A.S., &c.

Announcements by the Council.

CANTOR LECTURES.

The following is the syllabus of the course of Six Lectures "On Pottery and Porcelain," illustrated by specimens of various manufactures, and by photographs and diagrams, to be delivered by WILLIAM CHAFFERS, Esq. :—

LECTURE I.—MONDAY, JANUARY 21, 1867.

ANCIENT POTTERY.—Introduction. Assyria and Chaldaea, Egypt, Greece, Etruria, Rome, &c.

LECTURE II.—MONDAY, JANUARY 28.

MAIOLICA.—Italy, Spain, Persia, &c.

LECTURE III.—MONDAY, FEBRUARY 4.

FAYENCE.—France, Spain, Portugal, Russia, Sweden, Denmark, &c.

GLASS OR STONE WARE of Germany and Flanders.

DELFT WARE, &c.

LECTURE IV.—MONDAY, FEBRUARY 11.

ORIENTAL PORCELAIN.—China, Japan.

LECTURE V.—MONDAY, FEBRUARY 18.

EUROPEAN PORCELAIN.—Italy, Germany, France, Holland, Belgium, Russia, Poland, &c.

LECTURE VI.—MONDAY, FEBRUARY 25.

ENGLISH POTTERY AND PORCELAIN.—Early History, continued to the beginning of the 19th century.

The lectures will commence each evening at eight o'clock, and are open to members, each of whom has the privilege of introducing one friend to each lecture.

A new list of members of the Society has been printed, and any member can have a copy sent to him on application to the Secretary.

Proceedings of Institutions.

MANCHESTER MECHANICS' INSTITUTION.—The distribution of the prizes, medals, and certificates to the students in classes at the Manchester Mechanics' Institution at the last examinations of the Department of Science and Art, the Society of Arts, and the Union of Lancashire and Cheshire Institutes, took place on the evening of the 14th December, in the lecture-hall of the Institution. Mr. Oliver Heywood, the president of the Institution, occupied the chair, and there were also present—Mr. T. Bazley, M.P., the Mayors of Manchester and Salford, the Rev. Canon Richson, Mr. W. Fairbairn, LL.D., Mr. Thos. Lawton, visiting agent to the Union of Lancashire and Cheshire Institutes, Mr. H. B. Forrest, Mr. D. Fielon, Mr. J. Plant, and others. There was a very large attendance. Letters of apology were received from the Right Hon. H. A. Bruce, M.P., Mr. James, M.P., Mr. Cheetham, M.P., and Mr. Alderman Rumney. Mr. Jarrett, the secretary of the Institution, read a statement of the number of successful candidates at the several examinations, and of the prizes awarded. He stated that, at the examination of the Department of Science and Art, 153 candidates presented themselves, of whom 102 were successful. There were 25 first class,

21 second class, 59 third class, 23 fourth class, and 46 fifth class, making a total of 174 certificates of honour gained; last year the total was 293. Two silver and two bronze medals were also awarded at the last examination. At the Society of Arts examination 62 candidates presented themselves, of whom 48 were successful. Certificates were awarded as follows:—8 first class, 26 second class, 23 third class, making a total of 57; last year the total was 63. Mr. John Peiser, one of the vice-presidents, had intimated his intention of giving a sum of £5, to be awarded in three prizes, to the students most successful at the next examination in book-keeping, the class which Mr. Peiser is desirous to encourage. At the Union of Institutes examination, 41 candidates presented themselves; 19 in the higher grade, of whom 13 were successful, and 22 in the lower grade, 13 of whom were successful. Three of the higher grade students obtained prizes offered by the Union, in addition to certificates. In connection with the next Society of Arts examination, the president will continue his prizes of £5 and £3 each to the two students whose aggregate success for the years 1866 and 1867 shall be greatest; Mr. Leppoc repeats his £5 prize to the first-class candidates in arithmetic; and Mr. Peiser, as before stated, offers £5 to the pupils in the book-keeping class. Mr. Alderman Rumney again presents a prize of £5 to the most successful students in the science classes; and the president will give two prizes of £1 each to the two best candidates at the next Union of Institutes examinations. —The chairman having distributed the prizes, proceeded to deliver a very appropriate and effective speech, in which he dwelt upon the past history, and future prospects of the Institution, and summarized the educational efforts which had been made during the past few years. He specially alluded to an important meeting on the subject of compulsory education which had been held in the Town Hall on the previous Monday.—Mr. T. Bazley, M.P., moved a resolution declaring that the system of examinations as conducted by the Department of Science and Art, the Society of Arts, and the Union of Institutes, was conducive to the progress of general education, and therefore deserving of approval and support. He had been very much gratified with the conduct both of the successful and unsuccessful students. He remembered that his friend, Mr. Fairbairn, 40 years ago, was instrumental, in connection with the late Sir Benjamin Heywood, in calling into existence this institution; and Mr. Fairbairn had given another impulse to the cause of education by advocating with eloquence and with pecuniary power the formation of an engineering professorship at Owens College. After remarking upon the advantages of education to the young, and the necessity of freely providing it to the children of the very poor, he combated the worthless objection, as he considered it, to free education, that it was degrading to the parents of the children to whom it was extended, by reminding them that the principle of free education was at the foundation of our universities and public schools. The people of the Continent and of America were in advance of us in this respect, and set us an example which we ought to follow. The Mayor of Manchester briefly seconded the resolution, which was supported at some length by the Mayor of Salford, and unanimously carried. Mr. W. Fairbairn moved a vote of thanks to the donors of the special prizes. Mr. Forrest seconded the resolution, which was carried unanimously. On the motion of the Rev. Canon Richson, a vote of thanks was given to the president, and the proceedings terminated.

OPENING OF THE INTERCOLONIAL EXHIBITION.

This Exhibition was formally opened at Melbourne by his Excellency the Governor on the 24th October last, in the presence of a large concourse. The first of these gatherings took place in 1854, anticipatory of the Paris

Exhibition held in the following year. It was a creditable display for the period, a light structure of wood and glass having been erected for the purpose. The collection of articles constituted, however, rather a bazaar than an exhibition, most of them having been supplied by fancy goods men and general importers. Native produce was but poorly represented, and out of the entire list of exhibitors only thirty-six were in a position to contribute to the Australian court at the Paris international gathering. The Exhibition held in 1861 was a great improvement on its predecessor, the articles exhibited of local growth and manufacture being numerous and interesting. The building constructed in 1864, with the addition of an annexe nearly as large as itself, was used on this occasion. It resulted in the Victorian court achieving a proud position at the International Exhibition of 1862. These two events, however, though notable in Melbourne annals, sink into insignificance when compared with the magnificent undertaking which was recently inaugurated. Both in conception and execution this third Exhibition stands out as a grand and peculiar one. For the first time, the various colonies of Australasia meet in friendly competition at an independent gathering. It had been many months in preparation, and the interest attaching to it gradually increased, as exhibition after exhibition, in preparation for the central one, has been held in the large provincial towns of Victoria and the capitals of the neighbouring colonies.

The Commission nominated for the purpose was appointed a year ago. It was speedily perceived that the structure which had served for the previous exhibitions would be utterly inadequate to accommodate the collection which the various colonies might be expected to bring together; and one of the first important acts of the commission was to decide on uniting with the trustees of the Public Library in erecting an edifice worthy of the occasion, and suitable for the requirements of a museum after the temporary purpose had been served. It appears, however, that only the foundations and lower walls of the great hall and octagon are permanent; the superstructure is of wood, and the beauty of the interior is solely owing to its large size and to the elegant decorative colouring which has been laid upon it, under the superintendence of Mr. E. T. Bateman. The buildings occupied by the Exhibition consist of a great hall, a spacious octagon leading to it from the Public Library, two open-air courts on each side of this octagon, a northern wing containing the machines, a southern wing devoted to the pictures, and a large iron annexe, entered from the central hall by a short covered way. In addition to these there are the unoccupied portion of the garden in the rear of the building, the basement underneath the picture-gallery, set apart chiefly as dining-hall and refreshment-rooms, but also with cellars devoted to the exhibition of preserved meats, wines, beers, &c., of which there is a fine collection.

At the date originally fixed by the commission as the limit for the receipt of applications for space, very few had come in; it therefore became necessary to extend it from time to time, until at length applicants became almost more numerous than welcome, and the decided success of the undertaking was assured. This lateness of entry, however, has led to some confusion, both as regards position in the rooms and accuracy in the catalogues.

A few minutes before twelve, so complete were the preparations, that Mr. J. G. Knight, the secretary to the commissioners appeared with bound copies of the "Exhibition Catalogue." As noon struck the vice-regal party arrived. His Excellency, Lady Manners Sutton, and family appeared at the entrance communicating with the Public Library, and proceeded to the dais, and at the moment the band and chorus of 300 performers commenced the National Anthem. As it concluded Sir Francis Murphy, the acting president of the commissioners, stepped forward and read an address, in which,

after the warmest expressions of loyalty to Her Majesty, the commissioners proceeded as follows:—

"By the munificence of Parliament we are now assembled in a hall unequalled in the Southern hemisphere, and which, for extent and accommodation, as well as excellency of workmanship, will, when finished, be a lasting monument of the public spirit of our Parliament and the enterprise of our people. A report in detail of our proceedings will be laid before you, together with essays illustrative of our great national resources and of the social condition of the country, freely contributed by some of the most eminent men in our community. It is also our duty to inform your Excellency of the cordial manner in which this Exhibition has been supported by all classes in this country, and of the intelligent help which we have received from the manufacturers and workmen of every kind, to whose practical and generous efforts we are indebted for much of our success. We congratulate your Excellency on the arrival among us of representatives from New Caledonia, being part of the dominions of His Imperial Majesty the Emperor of the French; and also of the important city of Batavia, part of the dominions of His Majesty the King of the Netherlands, bringing to us the products and manufactures of their respective countries, and pledging themselves to a friendship and brotherhood in the objects of this undertaking. We further show to your Excellency that by the public spirit, intelligence, and industry of our sister colonies, we have gathered within these walls a collection of natural products proving the richness of their industrial resources, and a collection of works of art, manufactures, and machinery exhibiting the genius of their artists and the enterprise and the skill of their workmen, contrasting in friendly competition with our own—all being suggestive of a future time when the Australian colonies will be great and prosperous states, rivaling European kingdoms in all that is worthy of rivalry, and bound together by a united and loyal affection towards the British crown, as well as by the blessings of industry and peace. We earnestly hope that this Exhibition may be as productive of increased intercourse, of friendly relations, and of all the industrial advantages among these southern colonies, as exhibitions of a similar kind have been among European nations; being an additional proof, even in these southern seas, of the forethought and sagacity of the good and illustrious Prince Albert, whose memory will be ever revered, and associated with exhibitions of industry and art."

The report of the Organisation Committee was also handed to the Governor. From this document it appears that the great hall of the building is 220 feet in length and 82 feet in breadth, containing 17,000 superficial feet; the rotunda, 3,000; the north and south wings, 4,250 superficial feet each. Owing to the numerous applications for space by the intending exhibitors, the buildings were found inadequate to meet the demand, and it was therefore deemed advisable to erect the eastern annexe, containing 7,800 superficial feet, and even subsequently to increase its size by 3,000 superficial feet, giving a grand total of 38,600 superficial feet. The objects for exhibition were divided into six great classes:—Mineral products, animal products, agricultural, horticultural and indigenous vegetable products, manufactures and the useful arts, the ornamental arts, and machinery.

A fine collection of specimens of precious stones has been brought together through the energy of the Rev. Dr. Bleasdale. The banks in Melbourne have contributed valuable specimens of the precious metals, while from the various mining districts beautiful collections of quartz intermixed with gold have been forwarded. A pyramid is shown illustrative of the quantity of iron produced in Victoria from the year 1861 till a recent date. This structure is intended for transmission to Paris. There is a fair collection of samples of wool from the local exhibitions held since harvest, assisted by

agricultural societies of Victoria, have afforded an opportunity of obtaining the best and most varied samples of grain. Australian wine is well represented; and the specimens of indigenous woods, and their products, collected by Dr. Mueller, deserve particular attention.

Products from the exhibitions held at Ballarat, Sandhurst, Castlemaine, Beechworth, &c., have separate courts allotted to them; and complete collections have been presented from the districts of Wangaratta, Duncolly, Clunes, St. Arnaud, and others. The sister colonies—New South Wales, Queensland, South Australia, Tasmania, and New Zealand, are worthily represented by most complete collections of their various products and manufactures.

The north wing has been set apart for the arrangement of various kinds of machinery; and three engines, of twenty, sixteen, and four horse power each, are erected in the adjacent court, to afford motive power. The south wing is intended for the exhibition of paintings. In the open courts are fountains of the most beautiful and novel descriptions, which will add much to the success of the flower shows intended to be held from time to time, and arrangements for which have been made with the Horticultural Society of Victoria. Pipes from the Yan Yean Water Reservoir have been laid all over the buildings, so as to allay all apprehension of accident from fire.

In the eastern annexe will be found carriages of all descriptions manufactured in Victoria.

Much information, in the form of essays, has been provided by gentlemen in public departments, and ordered for publication; and it is intended that these works shall also be published in the French language. Mr. Brough Smyth, of the mining department, has furnished a description of the mineral resources of the colony. Professor McCoy, professor of natural science in the University of Melbourne, makes a report upon recent and fossil zoology. Mr. Selwyn, government zoologist, has presented an elaborate treatise on the physical geography, geology, and mineralogy of Victoria. Dr. Mueller, scientific botanist, a varied essay upon botany and the general vegetation of the Australian continent. Mr. Ellery, the Government astronomer and director of the meteorological department, gives an interesting description respecting the atmospheric changes of the climate and other observations made at the Melbourne Observatory. Mr. Archer full statistics of the colony.

Lists of jurors were in course of preparation, and a medallion has been designed, which it is intended to attach to a handsome decorated card to be presented to those considered worthy by the jurors of this distinction.

His Excellency, having made a suitable reply, congratulating the commissioners on the success of their efforts, declared the exhibition open.

The musical part of the ceremony now began. First hymns were sung the Old Hundredth Psalm, arranged for the band, and then by Mr. Horsley. Handel's Hallelujah Chorus was then performed, and the performance concluded with a grand march composed by the conductor for the occasion.

The object of the inauguration being now over, cheers were given for the Exhibition, the Queen, and the great champion. Up to the latter part of the afternoon, 1,737 holding season tickets passed through the doors.

EDUCATION IN FRANCE.

of the cause of education, general as well as special, and have contributed as well as for adults, is being aided as much as possible by public distributions of prizes and honours in all collections of parts of France. One of these public meetings was held at Privas, in the Ardèche, when a large number of both denominations, magistrates, public officers, and members of the *Conseil-Général* of the department, and 200 schoolmasters and teachers were present. The prefect addressed the meeting, and presented, amidst the cheers of the assembly,

the Cross of the Legion of Honour to M. Manson, a public schoolmaster of Vernoux. At Mont-de-Marsan there was also a large gathering at the invitation of the Prefect of the department; M. Guillonnet, deputy, presided, and, amongst other things, made allusion in his address to the new school of secondary special education, just inaugurated in the town. "Special education," said M. Guillonnet, "responds to a pressing necessity; in past times the State favoured the education of the upper classes, which alone could attain it; now, and in future, it aims at the teaching of the greatest possible number; this is its duty, because the places which heretofore were reserved for a few privileged people are now open to all the world. In a society like ours the democratic level, having effaced the differences which existed between the military and the manufacturing classes, between the magistrate and the farmer, between the advocate and the tradesman, the development of industry, agriculture, commerce, and speculations of all sorts, opens to human industry a wider field than that of public employment and the learned professions. . . . The Government has comprehended and well fulfilled its duty, and, certainly, the result which will accrue from the new organization of public instruction will be one of its noblest achievements." A teacher named Ducasse was then invested with the new decoration of an Academic Officer—the palm branches—and returned thanks on behalf of himself and his fellow teachers for the sympathy extended to them by the authorities of the department. The Prefect of the Loire also presided at a similar meeting at Saint Etienne, and was supported by the *councils* and other bodies, public officers and teachers of the department. Here, also, the Academic palms of the rank of officer were bestowed on M. Delorme, professor of design in the Lycée, for his gratuitous exertions during five months in improving the education of eighty foremen of works. The director of the Ecole Normale, the inspectors of primary education, and the prizemen of the adult classes, were afterwards entertained at dinner by the inspector of the Academy. At Constantine, in Algeria, the public distribution of awards occurred on the last day of September, under the presidency of the general of division commanding the province, assisted by the councillors and public officers. The inspector of primary instruction reported the results of the past scholastic session with respect to adult education. Out of 1,204 persons who attended the classes 286 could neither read nor write, and 143 could read only; at the end of the session 104 who had begun without any education could read and write, and 46 others could read with tolerable facility. Of the others they had all either improved themselves in what they had learned before or acquired new attainments. Some of the students had, in spite of bad roads, walked many miles to the school and back every evening. The municipal council of St. Ismier, in the Isère, voted a hundred francs in aid of the teacher of the adult classes, M. Hurmite, but this worthy master refused to accept the money, but desired it to be devoted towards the expenses of the new school now in course of erection.

The *Conseil-Général* of the department of the Oise has decided on the organization of an inspection of the labour of children in the factories of the department, and has recommended that this duty be performed by the inspectors of the common schools, voting, at the same time, an allowance of 1,200 francs to be divided amongst the inspectors in proportion to the services performed.

COMMERCE AND CURRENCY.

The *Produce Markets Review*, in an article on the currency question, after speaking of the differences of opinion that have existed on this subject, says:—

"At the present time there is, it seems, so far an approach to a common ground or partial assimilation of views, on the part of the mercantile world, that a re-

stricted currency is supposed to be more or less associated with those periodical financial crises for which it is so difficult to discover a remedy. It may not be amiss, therefore, at the present moment to inquire how far our system of currency has kept pace with the vast extension of our commerce during the period of seven years, commencing with the year 1858 and ending with 1864, the last year for which correct official returns can be obtained. The comparison would have been still more complete had it been carried back for ten, fifteen, or twenty years; but as no imports of specie were registered at the Custom-house previously to the month of October, 1867, it is evident that no calculations could be considered as complete which should exclude from consideration so important an element as the imports of gold and silver coin. The total value of our exports and imports, in other words, of our external commerce for the year 1864, amounted to £487,571,786, against £304,366,611 in 1858, showing an increase for 1864 of £183,205,175, or of rather more than 60 per cent., in our foreign trade. Although it is impossible to give even relative figures for the increase in our internal trade, it must have augmented in quite as large a proportion as our foreign trade. In addition to these causes for an increased demand for currency, it will be remembered that weekly wages have universally risen of late years; and as they are paid in actual coin, the greater demand from this cause alone must be considerable. To estimate approximately the increase in our currency, we must add together our coinage and imports, deducting all exports:—

The Gold and Silver coin, issued from Mint, from 1858, to 1864..	£41,929,364
Add Imports of British Coin during the same period	£8,026,423
	£49,955,787 (a)

From this we must deduct the value of the exports of British coin, the value of the worn coin, re-coined, the decrease in Bank-note circulation, and the money exported by emigrants to British colonies, and by other travellers, during this period of seven years, a large portion of which would not come back: thus, then, we get

Exports of British Coin, from 1858 to 1864	£32,137,304
Worn Coin re-coined in same period	699,003
Decrease in Bank-note circulation	341,218
Money exported by 1,110,000 emigrants, and by travellers, say ..	5,000,000

£38,177,922 (b)

Deducting (b) from (a) we get as a result an increase of nearly £12,000,000 in our currency; whilst our external commerce alone was £187,000,000, or more than 60 per cent. greater. There can be no doubt, in fact, that the increase in currency for many years past has not kept pace with the advance in trade. In answer to this, it may perhaps be urged that by means of cheques and bills and the clearing-house system, the rapidity of our circulation has so much increased as to meet all the requirements of trade. This is undoubtedly the case in ordinary times; but it is on the approach or during the existence of a panic that the real trial occurs, for then cheques, drafts, or bills become partially useless, and the demand is almost general for notes and coin. The serious nature of the issue raised may be gathered from the statements made in Mr. J. B. Smith's recent pamphlet on the currency, that the Bank of England and three other joint-stock banks had, at the beginning of last May, only £8,065,080 of cash in hand, against liabilities of £87,913,182. It is true they held securities, but in times of panic even Consols are unsaleable. This state of things is most serious, and unless steps are taken it must inevitably become worse, because trade must continue to increase while the supply of gold and silver cannot augment in the same proportion, and the issue of notes

is limited by law. The banks, from their constitution, must continue to lend money out; financial crises will recur with greater frequency, and if at any time confidence is shaken in the main sources of money supply, such as our large banks, the results must be disastrous. A craft that can sail in smooth water only, and is unable to survive the perils of a storm, is after all but a poor specimen of naval ingenuity. Our currency ought to be sufficiently elastic to expand or contract with the demand, and if this cannot be done with a gold medium, additional recourse must be had in times of pressure to the safety-valve of notes. To cure the evil, various remedies have been proposed; the Bristol Chamber of Commerce, and the Currency Reform Association, suggest the desirability of removing the issue department from the control of the Bank of England, and substituting a National Bank of Issue, "independent of trade and the Government." Without pretending fully to discuss the various issues to which this arrangement might lead, we may remark that the impossibility of adequately performing the functions of banking and issuing has been frequently dwelt upon by many of our ablest financial authorities. 'It is a serious difficulty,' observed a writer in the *Economist*, two months ago, 'that the same bank which keeps the ultimate reserve should also have the duty of lending in the last resort. The two functions are in practice inconsistent—one prescribes keeping money, and the other prescribes parting with money, and no ingenuity can in critical situations fulfil both.'

Fine Arts.

EXHIBITION OF THE WORKS OF THE LATE HIPPOLYTE BELLANGÉ.—The collected works of Bellangé are to be exhibited in February, in the rooms of the Ecole des Beaux Arts in Paris; and after the exhibition, the sketches of the artist and such pictures as belong to his family will be sold by public auction. Bellangé's last production, "The Guard Dies but never Surrenders," which the artist touched while on his death bed, but which remains still unfinished, is amongst the relics to be sold. It is a remarkably fine specimen of the painter's style, in spite of its incomplete condition, and formed a most attractive object at the Paris Salon this year.

ANNUAL MEETING OF THE FRENCH ACADEMY OF FINE ARTS.—The annual public meeting of this Academy was held a few days since, and was crowded as usual. The principal business of this meeting is the announcement of prizes awarded, and of the subjects selected for future competitions; one of the Trémont prizes, of 2,000 francs each, was awarded between M.M. Mathieu and Lecomte Dunout, painters, and the other to M. Vogel, composer of several operas, including the "Siège de Leyde," and the "Moissonneuses," performed at the Théâtre Lyrique. M. Vogel, finding little demand for great operas, produced, not long since, an opera buffa for the smallest theatre in Paris, the Folies Marigny, in the Champs Elysées, and the President expressed a hope that the prize awarded to him would enable him to surmount the difficulties which stood in his way, and give his attention to works of a higher character. The Lambert prize of 1,300 francs was given to M. P. Nauteuil, painter, to aid him in overcoming difficulties in which he had fallen, in consequence of his father's death. The Deschaumes prize of 1,500 francs, founded to aid young architects without fortune, who have relatives dependent on them, was divided between M. Marcel Boisvert, and M. Méquer. The latter artist was, at the age of twenty-six, a workman in a factory, when his arm was broken by machinery; the limb was incompletely cured, and he was compelled to seek a new occupation; he studied architecture, while getting his living by writing, and afterwards obtained employment as conductor in the department of the Pont-et-Chaussées, and supported his mother and sister. The prix Leclerc was awarded to M. Dutert, architect,

for a design for a monument commemorative of the visit of the Emperor to Algeria. The subject proposed for the same prize next year is "a monumental bridge, situated in the midst of a great city, at the point of an island, magnificently decorated, and presenting an edifice consecrated as a souvenir of a universal exhibition of industry." These terms accord exactly with the position of the Pont Neuf, which touches the point of the island of the old city of Paris, where stands the equestrian statue of Henri IV., and the rebuilding of this bridge, and of the quaint old triangular Place Dauphine, once a court quarter of the town, has long been under consideration. Seven treatises were sent in for the Bordin prize, the subject being the teaching of sculpture amongst the Greeks and modern nations, and the Academy marked its appreciation of the value of these works by multiplying the prizes; that of 2,000 francs was given to MM. Louis and René Mesnard, joint authors; a second prize of half that amount to M. Henry D'Escamp, and honourable mention to a third treatise. The subject for the Bordin prize next year, as already announced in these columns, is the effect of national circumstances, politics, morals, and religion on the Beaux Arts; and for 1868 the analogies and differences which appear between Greek and Roman architecture; the authors being instructed to point out, either on the evidence of facts, or by deduction, what artists and artisans contributed to the construction and decoration of the public and private edifices either of Greece or Italy, and what was the civil and social condition of such artists and artisans. The business of the meeting terminated with an historical notice, by M. Beulé, of the life and works of the late sculptor, Francisque Duret, producer of the well-known "Neapolitan Dancer," in the Luxembourg Gallery, "The Improvisatore," the statue of Rachel in Phèdre, and of many other fine works.

Manufactures.

AGRICULTURAL MACHINERY IN AMERICA.—Mr. James Howard, in a paper on this subject, recently read before the Farmers' Club, says:—"In England, as you are all aware, an enormous demand has set in during the last twenty years for improved agricultural implements. This has mainly arisen from a more correct appreciation of the value and advantages of good machines. In America, owing to the high rate of wages and the difficulty of obtaining an adequate supply of labour, agricultural machinery calculated to save manual labour has been an absolute necessity. Without the reaping machine the crops could not be harvested, and without the thrashing machine they could not be brought to market. Hence the trade in agricultural implements has reached gigantic proportions. From inquiries I made I found that at least 100,000 reaping and mowing machines are made annually in the States. I was there during the harvest—everywhere the reaper was to be seen going; the scythe or the sickle was just as exceptional as the reaping machine was in England ten years ago. The thrashing machines were very inferior to ours, though the Americans were very apt to think they were far ahead of us, and that we were a very slow people; their machines were almost exclusively worked by horse-power. One farmer on the banks of Lake Ontario, who had ten horses yoked to his thrashing machine, seemed much surprised that in England we did all our thrashing by steam-power. He had never heard of such a thing. The implements of the farm, if we except reapers, are of very inferior design and build to our English machines. I thought one great want in American farming was good storage drills and horse-hoes to follow. In a country where labour is so scarce and dear, the hoeing of the corn crop by animal power would be an immense boon. The drills are not made with a storage; consequently, the drilling is bad, rendering the use of the horse-hoe im-

practicable; and, as labour is so dear, in most cases the corn and the weeds seem to be left "to grow together until the harvest." Nearly the whole of the implements are furnished with a seat for the men to ride—the idea being to get more work out of the labourers. I found the prairie farmers very desirous of having a good "gang plough," as it is called, on which the ploughman could ride. I told them if the men had easier work, it would be at the expense of the horses. As reaping machines are used, and in consequence open furrows undesirable, the land is frequently ploughed as follows:—A short ridge is set in the middle of the field, the plough passing not only up and down each side, but a furrow is taken off in going round at each end. By this means the plough is always in the ground, and the whole field ploughed without leaving an open furrow. A field may also be commenced by ploughing a furrow all round the outside, and finishing in the middle. The American farmer is not satisfied, as we are, with one team ploughing an acre per day; but expects from each team of a pair of horses two acres to two and a-half acres. I rather doubted so much being done; but was over and over assured by both masters and men that two acres and a-half were not at all an unusual day's work. The furrows, I must tell you, are over a foot wide—none of your fancy ploughing-match style. The land is also generally much lighter than our English soils, and the ploughing is, according to my notions, very much too shallow—a fault not at all uncommon on this side the Atlantic. Steam ploughs have not yet been introduced. Several attempts have been made; but as all the schemes have been with engines to travel over the surface—after Romaine's plan—no wonder they have not succeeded. On the prairies there would be no difficulty in constructing machinery capable of breaking up twenty or even twenty-five acres of such land per day, and this with only three men. Where labour is so scarce, and time such an object, the advantage of the steam plough would be immense. In Iowa I saw a very simple and efficient apparatus called a "horse pitchfork" for raising crops on to the stack, a horse simply drawing the load over a pulley. I also saw a hay-loader attached to the rear of a waggon, and which gathered up and elevated the crop on to the vehicle, thereby saving much manual labour."

IRON BEDSTEADS have been long made for use in hospitals, workhouses, and barracks; but it is not more than thirty years since the trade was fairly established, and iron and brass bedsteads began slowly to find their way into the houses of the middle and lower classes, and the less important sleeping rooms in the best houses in the country. One of the advantages which metal bedsteads possess is the facility with which they can be put together, or taken down, owing to the simplicity of the joints by which the several parts are united. It is a simple dovetail joint, and consequently requires no nut, cotter, or other loose part liable to be lost or to get out of order; and its superiority over its predecessors is attested by the fact that except in officers' bedsteads, those for lunatic asylums, and some few other special cases, it has superseded all others. At the same time that the dovetail joint was adopted, a very convenient and cheap method for making the head and foot rails of iron bedsteads was introduced. This consists of uniting the separate parts of the rails consisting of pieces of rod iron, round, oval, or any desired section, by means of castings in chills or iron moulds. From the date of the introduction of these improvements, about twenty years ago, the trade has developed rapidly. In 1849 there were not more than eight manufacturers who could be reckoned as established in the trade, and of these four or five belonged to Birmingham. Since then the number of well-known makers in that neighbourhood has increased to twenty, and the number of finished articles produced weekly from about 400 or 500 to 5,000 or 6,000. These are absorbed in nearly equal quantities by the home and foreign trades. There are a few manufacturers in London, and some very small ones, hardly worth

notice, in other large towns; but nowhere except in Birmingham and London, and hardly in London, can the manufacture be said to exist as a trade. It is carried on in various continental countries, particularly in France, Italy, and Spain. In Birmingham there are probably from 2,000 to 2,500 persons employed in the manufacture, without reckoning the subsidiary trades of tube-making, malleable iron casting, &c.; of these about half are boys, and one-sixth girls and women.

TOBACCO MANUFACTORY AT NICE.—This manufacture, which before the annexation was carried on in a small and unhealthy locality, now occupies a vast and handsome building, with a better ventilation than that prescribed by science for barracks and hospitals. Under the Sardinian government it gave employment to about two hundred women; now it gives occupation to seven hundred and twenty men. The average day wages, which were formerly 40 centimes, are now 1 fr. 51 cents. for women, and the men can earn about 3 frs. 56 cents. The average rate of wages for apprentices is fifty-four centimes. It is anticipated that five years hence from fourteen to fifteen hundred persons will be employed. In France there are seventeen tobacco manufactories, each of which has its own speciality; that of Nice having acquired a reputation for the superiority of its cigars, *bouts coupés* and *bouts roulés* at five centimes each.

SERICULTURE IN SYRIA.—The principal localities in the province of Aleppo where the mulberry is cultivated and sericulture is carried on, are the districts of Antioch, Orfar, and the neighbouring countries. The rearing of silkworms there is susceptible of a considerable development, especially in the vast plains of Hamk, situated between Aleppo, Antioch, and Alexandretta, where the land offers all the desired conditions; but the scarcity of manual labour, and the vicinity of lawless tribes, have been great obstacles up to the present time to agriculture. These districts have not been spared from disease any more than other countries where sericulture is carried on. In the towns of Arsons, Payas, and Karadach, in the district of Antioch, where the annual produce formerly amounted to about 44,100 lbs. of silk, there has been a considerable reduction. Since the first appearance of the epidemic it has not entirely disappeared from any of the localities that have been smitten with it. In this country the peasants alone devote themselves to the rearing of silkworms; and it is by great efforts and labour that they have been enabled to pass through the crisis that has so desolated the country. A great number of persons have cut down their mulberry trees in order to cultivate the land, and more especially to grow cotton. Those who, possessing sufficient land not to have been reduced to this extremity, still continue to cultivate the mulberry, though always giving preference to other cultures, being persuaded that the disease once produced is transmitted from the worm to the seed (egg), have been obliged to procure healthy seed from places that are known to be exempt from the epidemic. Although their endeavours have not been always successful, it appears that last year a very healthy seed was obtained from Tchandir, a village situated near the river of the same name, a tributary of the Costrus, about ten leagues to the north of Adalia (Satalia). This seed has been most successful everywhere it has been employed, but for the first time only. The silkworms that were hatched from it produced an unhealthy seed, and the worms from it were directly attacked by the disease, and sericulturists are obliged for the future to use exclusively the Tchandir seed, which it is necessary to import every season from Tchandir. The great demand has rapidly augmented the price, which last year was as low as five piastres (11½d.) per dram. This year it has been sold for double the price, and it is much sought after, as its yield is in the proportion 80 drams of silk to one dram of seed. Although the province of Aleppo has suffered greatly from the epidemic, it is to be hoped that by the intro-

duction of the new seed, the results of which have been most advantageous, the evil will be overcome, and that ancient prosperity will reappear.

Commerce.

INTERNATIONAL CURRENCY.—By the terms of the monetary convention recently concluded between Belgium, France, Italy, and Switzerland—the four governments which have already a uniform system of weights and measures—bind themselves to the adoption of one uniform gold and silver currency throughout their states. For the complete execution of the scheme of an international currency, the copper coinage should also have been assimilated, but at present the experiment is limited to the gold and silver coinage; though, as coins of the latter denomination will be included, in value as low as 0.20 of a franc, or about 2d. of our money, the uniformity will be sufficiently general for all practical purposes. The gold coins are to be five in number, of the value of 100 francs, 50 francs, 20 francs, 10 francs, and 5 francs respectively, all of a certain weight, size, and value prescribed in the terms of the agreement. Similar rules apply also to the silver coinage, which is also to comprise five pieces, in value 5 francs, 2 francs, 1 franc, 0.50 franc, 0.20 franc respectively. Each state is to have the power to refuse all coins “whose weight shall have been reduced by wear to the extent of 0.50 per cent. below a certain fixed allowance in the case of gold, and 0.5 in silver, or where the stamped impressions shall have been effaced.” Two years only are allowed for the withdrawal of the existing circulation, and the contract is to remain in force for a period of fifteen years, when the results will be carefully investigated. It is also provided that “the right of acceding to this convention is reserved to any other state which shall accept its obligations, and which shall adopt the monetary system of the union in whatever relates to gold and silver specie.” The *Produce Markets' Review* observes that this movement in the direction of uniformity, initiated at present by only four of the European governments, is one that, like our free-trade system, or railway communication, or the employment of steam-vessels, or any other ideas of a similar character, originating in the mental activity of the present century, will surely make its way sooner or later amongst all nations which would not behind the age in which we live. The question of an international currency is, in fact, a question of the adoption or rejection of the decimal system, and though there is much that can be urged in defence of other systems, the superior merit of convenience, facility, and correctness in making calculations, must surely outweigh any advantages that may result from the fact that a given number admits of being subdivided into a greater number of divisors. The number 10, for instance, has but two divisors, 2 and 5, whilst 12 can boast of having twice as many—2, 3, 4, and 6. It is not to be denied that there are advantages to be found in existing systems of calculation, but the decimal system alone insures us a rapid and infallible method of performing the arithmetical calculations most in use, whilst it enables us entirely to dispense with others. Those who are practically conversant with the details of work performed in any large counting-house, know by experience the amount of labour and time required for “casting out,” as it is technically termed. It is within limits if we estimate the saving of labour in calculation that might be effected in this direction by the adoption of the decimal or metric system of coinage, weights, and measures, at about 25 per cent.; that is to say, where a man now employs one hundred clerks he might do the work with seventy-five.

COMMERCE AND INDUSTRY OF TCHÉFOU.—Tchéfou is situated most favourably for commerce. The French have established there a naval station, and a store of coal procured from Northern China. The British navy

also possesses an island situated in the bay that serves as depôt and hospital. Ships of war of both nations constantly anchor there. Tchefou is the nearest port to Pekin, and is at no time of the year blocked up by ice. From this place during the winter, at the arrival of each mail, the couriers of the embassies and commercial correspondents leave for Pekin and Tientsin. Should the progress of European influence one day induce the Chinese Government to establish free trade, it cannot be doubted but that Tchefou will become a free port open to all kinds of merchandise, and also the great entrepot of European commerce in Northern China. The silk-growing districts bordering on this town are as yet all but unexplored, and in no case have been cultivated. They contain, however, for the regeneration of the exhausted races of the silkworm, resources that might be very valuable if they knew how to turn it to account. The wooded mountains of the environs feed, in fact, a species of wild silkworm that spins a brown silk, the quantity of which might be brought to market would not amount to less than 12,000 bales yearly. The quality of these silks varies according to the various modes employed for the winding, and the care used in this operation. The fabric which is made of it is called in the country *ponges*, and 100,000 pieces of it might be purchased annually. The province of Tchefou also furnishes a large quantity of fine yellow silk. In 1861 and 1862 a thousand bales of this silk were exported; but since a very small quantity of it has been sent in the market, being exclusively employed by the silkweavers of the country for the manufacture of fabrics for local consumption. Formerly, the greater portion of the silk fabrics worn in the north came from Foochoo and other manufacturing towns in the south. This trade has ceased since the devastations of the southern provinces from rebellions, and at present the value of silks imported to Tchefou only amounts to about 1,200,000 francs, or £48,000 annually. The silk trade can only attain some importance in this port by the necessity of the interchange of products of the soil for European goods.

MERCHANT NAVY OF NORWAY, SWEDEN, AND DENMARK.—In 1864 the merchant navy of Sweden was composed of 3,198 vessels, the total tonnage of which amounted to 381,162; and the number of Norwegian ships, according to the returns of 1865, amounted to 5,407, of a total tonnage of 1,058,847. The figures show that the total number of vessels of the United Kingdom of Sweden and Norway amount to 8,605, and represent a tonnage of 1,440,009, and give employment to about 48,300 seamen. An increase of 570 vessels, the total tonnage of which amounts to 5,990, has taken place in the merchant shipping of Denmark within the last two years, which formerly was composed of 3,079 vessels, of the total tonnage of 74,140, now numbers 3,649 vessels, with a total tonnage of 80,130; this shows an increase of 8 per cent.

THE TRADE OF OSTEND.—The last vessels employed for the cod fishery have now returned to Ostend, and the last sales of this fish have been effected. This year 13,683 tons of cod-fish have been taken by the Ostend fishermen, of which 13,137 tons is Doggerbank cod, and 546 tons from Rockall and the Feroë Islands. This shows an increase of 871 tons on the take of last year, which amounted to 12,712 tons. The quality is excellent, and finds a ready sale. The number of vessels employed in this fishery was exactly the same as that of last year, namely, 166; and the Ostend fishermen still continue to go to Doggerbank in preference to any other spot. The oyster trade has not made any decided improvement on that of last year, although there has been an important reduction in prices. The oyster merchants of Ostend are now bound, by an agreement amongst themselves, to keep up the prices of oysters, and this is partly owing to the general thinning of the beds. This price, however, is considerably below that of 1865. Lobsters are likewise an article of an important trade; they are usually

imported from Norway, and are sold at from one to six francs each, according to their size, or whether alive or dead.

IMPORTS AND EXPORTS.—The value of the goods imported into the United Kingdom in 1865 amounted to upwards of £271,000,000; and that of the exports, of British produce and manufacture, to nearly £166,000,000 sterling. Twenty-five per cent. of all our import and export trade arises out of commerce with the eastern countries—India, China, Egypt, Japan, and Australia.

CUSTOMS.—The annual Customs' report for 1865 shows a satisfactory result as regards the commerce of the port of London. In all departments of trade there is an increase, which is most marked in the case of tea, as the tendency exists to concentrate such cargoes in the port of London. The quantity of tea entered here for home consumption amounted, in 1865, to no less than 61,000,000lbs., which produced 62½ per cent. of the whole duty collected in the United Kingdom.

COAL EXPORTS.—The exports of coal in the nine months ending September were 7,586,500 tons, against 6,938,213 tons and 6,615,915 tons for the corresponding periods of 1865 and 1864. The shipments have increased more or less considerably this year to Russia, Sweden, Denmark, the Hanse Towns, Spain, Italy, Brazil, and British India; but they have decreased to Prussia, Holland, and the United States.

THE BAMBOO, which grows abundantly in most of the West India Islands, has been for some time past largely exported from Jamaica to New York in bales and bundles for the purpose of being manufactured into paper, and has been proved equally as valuable as rags.

Colonies.

TEA CULTIVATION IN AUSTRALIA.—The following is from the *South Australian Register*:—"The idea that the China Tea-tree is a delicate plant, and that its success in a climate like this is impossible, will probably turn out to be a great fallacy, if the matter is fairly tested. We are therefore glad to see that the Government have purchased £50 worth of seed, and that a portion of it is to be carefully sown in the Botanic Garden, whilst the remainder is to be distributed throughout the colony, so as to try a variety of situations and soils. From a great deal of information on the subject, which we have obtained from Dr. Schomburgk, it appears that the China Tea-plant may be easily acclimatised in South Australia, for it is a plant which successfully resists drought, frosts, and other severe atmospheric changes. What is particularly important to us is, that so far from a large quantity of moisture being required, it is, in fact, injurious to the plant; and therefore in Asia its cultivation on a large scale is pursued chiefly on the tops and slopes of hills, where good natural drainage is secured; but it flourishes equally well in the soil of plains, where the water does not lodge so as to form puddles about the roots of the trees. As to the soil required, the best is vegetable mould, largely mixed with sand; but it also grows well in many other soils. It takes good hold of the ground, and flourishes in those spots where a thin stratum of earth overlies metamorphic slates, intersected by trap rock, or where the subsoil consists of stony fragments or packed boulders of coarse granite. As to the mode of preparing the ground, sowing the seed, and treating the young plants, we will proceed to give our readers all particulars, as supplied by Mr. Sterndale, who is practically acquainted with the subject, to Dr. Schomburgk. That gentleman says it matters not whether the land for a tea plantation be flat or highly inclined, provided that the soil be suitable and sufficiently drained; but on no account should the land be liable to be flooded or swamped during the rains. Manuring or irrigation are quite unnecessary, unless when applied to weakly seedling plants under the age of twelve months. That the plant is excessively

hardy has been proved by experiment at various altitudes, from 200 to 10,000 feet above the sea level, at which last great height it is found wild in the forests in the form of a hard wood tree, of a height of 25 ft. by 1 ft. diameter, of which the extreme age is unknown. These trees are exposed to storms, snowfall, and frosts, which congeal the streams to the thickness of several inches of ice, while in other localities they are occasionally subjected to hot winds and long drought, under which cereal crops perish for lack of moisture. The general practice in preparing the land is by the ordinary system of ploughing, unless in rocky or precipitous places, where the ground is loosened with a pickaxe to the depth of one foot, for the reception of each seed or plant, the intervening spaces being left undisturbed. Tea plants in Asia flower from about the middle of August to that of February, and the seeds ripen in about thirteen months. All the plants do not come into flower at once, but some are in flower in September, others in November, December, or January. Many throw out a second set of flowers in March, April, May, and during the winter; so that from the same plant unripe and ripe seeds and flowers may be gathered at one and the same time. The first year the number of plants varies from one to seven. The seeds are contained in a capsule. To ascertain when they are ripe, open the capsule, though green, and if their colour is a nut-brown they are ripe; if not ripe, they are of a reddish colour mixed with white. If the seeds are allowed to remain on the bushes a short time after they are ripe, the capsules burst and they fall out. It is necessary, therefore, to remove them. The plants are usually placed at five feet distance from each other, which takes about six pounds of seed to the acre. If the seed be fresh, the general practice is to plant it out at once in the spots where it is intended to permanently remain. This is done by digging a hole, with a pickaxe or mattock, one foot deep, filling it with the loosened earth, and sticking the seed about three inches below the surface. In cases of experiment with inferior seed, or upon untried land, it is most advisable to plant in nursery beds, about six feet in width, into which the seeds are dibbled or drilled at two or more inches apart from each other. The most suitable season for this operation is the commencement of the winter rains, as the moisture materially assists their germination. Some will germinate in four or six weeks, but many will lie dormant for four months, and in most cases none will grow until the advent of the rains. Young small seedling plants stand extreme cold badly; if, therefore, they germinate at such a time, they ought, in a new climate, to have a top dressing of manure, and to be protected by branches or grass, which, when the sun shines, should be removed, to give them the advantage of its beams. In this manner small plants may become fit for removal in two months. As soon as the young plants are three inches high they ought to be weeded, for if weeds are allowed to remain they draw them up, and thus make the plants thin and weakly. It matters not though the weeder, in removing weeds, disturbs seed germinating, as they can easily be put in the ground again. Moreover, the advantage given to the young plant, by opening up the soil around them is great, and more than compensates for the injury done. Plants are sometimes raised from layers and cuttings. The most favourable seasons for these operations is when the sap is beginning to rise and in full action, as during the rains. Seedling plants ought not to be transplanted until eight inches high, and in planting them on the slopes of steep hills care should be taken to place them horizontal to the dip of the land, as the earth is not so liable to be washed away from the roots by the heavy rains. Tea leaves ought not to be gathered until the third year, and then during the rains, in order to allow the bushes to attain a considerable size. If the plants are allowed to grow out long leading shoots in the second year, these

ought to be nipped off in order to induce the plant to throw out lateral shoots, and become of a thick and bushy form, yielding abundance of leaves. The leaves are gathered during the rains, the number of pluckings of each plant being four, and in very wet seasons five, with an interval of from four to six weeks between each. Each plant will yield in the third season about half a pound of raw leaves, or two ounces of manufactured tea of a superior quality, giving an average of about 80 lbs. to the acre. Two years more will increase the yield tenfold, being 1½ lbs. of manufactured tea to the plant. The process of gathering the leaves is extremely simple, and is chiefly performed by women and children. All old and fibrous leaves are left upon the tree. The young leaves are stripped off with the hand, an inch or so of the soft and succulent stalk being taken with them. The finest kind of black tea (Pekoe) is prepared from the tender buds at the extremity of the twigs, and for this purpose is kept apart from the rest. From the remainder are manufactured the more common kinds, viz.:—Souchong, Pouchong, Congou, Bohea, Young Hyson, Hyson, Gunpowder, Imperial Gunpowder, &c. A woman accustomed to the work will gather in a day from 16 lbs. to 20 lbs. of raw leaves. The proper time for sowing the seed in this colony (South Australia) is from June to August—the present is therefore a favourable opportunity for commencing."

PRESERVED MEAT.—Under date October 27th, the *Melbourne Argus*, an Australian journal of great repute, refers to the operation of a new company on the Clarence River, for preserving meat and making extract of meat after Liebig's plan. The preserving is after the usual English process, but with the great advantage of its being performed where meat is rarely over 1½d. per lb., and where, therefore, the picked joints are alone packed. The herds of Australia have the advantage of being derived from English cattle, and are only second to them in excellence. The preserved meat is of course principally intended for ship use, and a considerable portion will be sold in the colonies. The extract of meat will probably come to this country, and an opportunity of comparison will be afforded between that which is made of the wild cattle in South America, such as is now being largely sold in England, and the extract made of the progeny of our own English bulls. The *Melbourne Argus* states that the operations of the company are likely to be very extensive.

Publications Issued.

A HISTORY OF BANKS FOR SAVINGS IN GREAT BRITAIN AND IRELAND. By William Lewins, author of "Her Majesty's Mails." (Sampson Low.)—This work gives an accurate account of the early history of savings' banks, and deals fully with their parliamentary history. With respect to the latest modification of the savings' bank principle as exhibited in the measures brought about within the last few years by Mr. Gladstone (to whom the work is, by permission, dedicated), the author's endeavour has evidently been to treat all the questions involved fully and impartially, and great pains has been taken to secure perfect accuracy both as to facts and figures. In reference to by far the most important measure relating to this subject, namely, the establishment of Post-Office Savings' Banks, the following extracts will not be without interest:—"Much that remains to be told of savings' bank reforms, and of other proposals to supplement the system by fresh provisions, may be told in connexion with the life of a gentleman to whom reference has already been made. Amongst those who have devoted much time and immense labour to bring about a better state of things in savings' banks, the foremost place is undoubtedly due to Mr. Charles William Sikes, of Huddersfield. Mr. Sikes, the son of a private banker of

that town, was born in 1818. We will pass over his early years, only remarking that he received a commercial education, and, in 1833, entered the employ of the Huddersfield Banking Company, the third or fourth joint-stock bank established in this country. It was while Mr. Sikes was cashier of this bank,—which, like other private banks, received deposits above £10, and allowed interest at the current rate,—that his attention was arrested to the question of banks for the people. He witnessed a considerable number of instances of workmen who, beginning with a few pounds, had silently amassed what was to them a little fortune of one, two, and even three hundred pounds; and he became deeply impressed, as he himself informs us, not only with the idea that the number of these provident working people was far less than it ought to be or might be, but that the social and domestic results for good that would ensue would be absolutely incalculable, if bank depositors among the working classes became the rule instead of the rare exception. About this time—the era of the free trade agitation—there was great distress in the manufacturing districts, and Huddersfield, like the rest of the West Riding towns was heavily visited. . . . Mr. Sikes tells us that he had already begun to feel, that though much might be done for the working classes by kindly and temperate advice, the greatest share of the work of their social elevation would have to be achieved by their own individual efforts; he came to the conclusion that his work might well lay in endeavouring to stimulate the poor to more provident habits; and that, if there was anything in the constitution of such societies as were formed expressly to foster these habits which stood in the way of the poor man, the obstacles ought either to be quickly removed, or some new organisation must be planned to effect this purpose. With this end in view, Mr. Sikes addressed a long letter to the editor of the *Leeds Mercury*, in 1850, which was subsequently republished in the form of a pamphlet, and widely circulated, recommending the formation of what he called ‘preliminary savings’ banks.’” The author then gives an account of the successive steps which Mr. Sikes took to accomplish the objects he had in view. In 1854 he appears to have published a pamphlet, entitled “Good Times; or, the Savings’ Bank and the Fireside;” an admirable little annual for the class for which it was written, and which obtained a large sale. For some time, however, he appeared to have “carefully abstained,” says the author, “from saying anything that would tend to lessen the influence or usefulness of the existing savings’ banks; but in the year 1855 the time would appear to have arrived when it became necessary to attempt some reforms in their constitution and management.” In 1856 he addressed an exhaustive letter to the Chancellor of the Exchequer, the late Sir G. Cornewall Lewis, on “Savings’ Bank Reforms.” Mr. Sikes deserves the credit of having been the first to point out the inherent defects in all parts of the savings’ bank system, and the first to suggest an entirely fresh form of management. Everything that an ingenious marshalling of figures, an array of argument, and even eloquence could do, Mr. Sikes did, but all appears to have been equally unavailing. The Chancellor of the Exchequer made attempts, as we have before seen, in the House of Commons, to improve the organisation of savings’ banks, but without success. When the Committee on Savings’ Banks was appointed, in 1858, Mr. Sikes was called as a witness. He again described the plans which he had suggested in 1856, and which had undergone little or no modification since that time. The author proceeds as follows:—“Confining ourselves at present to the origination of the principle of Post-office Banks, without reference to the wonderfully simple and efficacious scheme afterwards organised, we find that several different gentlemen had between the years 1850 and 1860, and acting entirely unknown to each other, matured plans, and in one way or another actually proposed them, to remedy

the deficiencies of the existing banks, on some such principle as that eventually adopted. To Mr. Sikes belongs the undoubted merit and honour of having independently originated and matured a plan of operation more or less equal to the object in view; of having persevered in the object of bringing the matter prominently before the public; and of being so fortunate as to have proposed his scheme at a period when the country possessed in Mr. Gladstone a statesman of extraordinary versatility and power at the head of its financial operations, and who had given abundant evidence of his willingness to grapple with uncommon difficulties where a need is proved and the principles of a measure are shown to be sound. Having matured his plan in June, 1859, Mr. Sikes communicated it to Mr. Edward Baines, the member for Leeds, in the form of a printed letter; and this gentleman, well known for his wide sympathy with the industrious classes, after studying its details, expressed his warm approval of the project, and engaged to bring it under the notice of Sir (then Mr.) Rowland Hill, the secretary of the Post Office. That there was now no indisposition—if ever there was—on the part of the authorities to such a measure is evident from the reception it met with at their hands, as shown by the letter below.* Encouraged to persevere, Mr. Baines and Mr. Sikes had an interview with the secretary and some of the principal heads of the departments of the Post Office, when the draft of a plan was read to them for working such a measure. The next step which Mr. Sikes took was to place himself in communication with the Chancellor of the Exchequer, Mr. Gladstone, and he was met by a cordial acknowledgment. The letter, in which the scheme was explained, was then given to the public, and was read before the Social Science Association which met in Bradford in the autumn of that year, Lord Brougham having also mentioned the matter in his inaugural address. Several Liberal newspapers went warmly into an advocacy of the principles of the measure, if not of the measure itself; and in the early part of November, 1859, the members of the Huddersfield Chamber of Commerce strengthened the hands of their townsman by passing an unanimous sentence of commendation upon it; and not only so, but they resolved to send Mr. Sikes’s pamphlet to all the Chambers of Commerce in the kingdom, recommending them to support the plan, which several of them eventually did. During the interval, Mr. Gladstone had amply fulfilled his promise to give the subject his best attention. . . . The scheme may be said to have now soon passed out of Mr. Sikes’s hands, and to have fallen into those of others, who saw that it would be necessary largely to remodel it, in order to make it fit into the machinery (of the working of which Mr. Sikes was necessarily ignorant) upon which it would have to be engrafted. On the 16th September, 1861, the Post Office commenced business with 301 offices as Savings’ Banks, gradually increasing the number until in March, 1866, there were 3,369 Post Office Savings’ Banks in the United Kingdom, of which 452 are in the metropolis, and in December last there were £11,819 open accounts, the amount accumulated being £8,626,400—an average of £10 13s. 4d. each depositor.”

HANDY BOOK OF RULES AND TABLES FOR VERIFYING DATES. By John J. Bond, Assistant-Keeper of the Public Records. (*Bell and Daldy*).—No book of any importance on this subject has been published since that

* Mr. Rowland Hill to Mr. Baines, M.P., 2nd August, 1859.—My dear Sir,—With modifications which could readily be introduced, Mr. Sikes’s plan is, in my opinion, practicable so far as the Post Office is concerned. The plan also appears to me to be practicable in its other parts; but on these I would suggest the expediency of taking the opinion of some one thoroughly conversant with ordinary banking business, and who is acquainted also with savings’ banks. I need not add, that if carried into effect, the plan would in my opinion prove highly useful to the public, and in some degree advantageous to the revenue. I should be most happy, when the time arrives for doing so, to submit it for the approval of the Postmaster-General.—Faithfully yours, ROWLAND HILL.

by Sir Harris Nicholas, based mainly on the French work entitled "*L'Art de Verifier les Dates.*" The present work is the result of twenty years' experience in dealing with the chronology of public records and ancient documents, and sets forth, in a very lucid manner, the importance of a thorough comprehension of the changes of style in writing dates, especially in connection with legal and other documents. In the introductory preface, Mr. Bond illustrates this by quoting some instances where the change of style has been overlooked by historians and others. One of these, taken from M. Guizot's "*History of Oliver Cromwell and the English Commonwealth,*" is as follows:—"Anne of Austria and Cardinal Mazarin thought it fitting that the young King of France should make some effort to save the life of the King (Charles I.) his uncle, and Louis XIV. accordingly wrote two solemn letters to Cromwell and Fairfax; but before M. de Varennes, who was appointed to deliver them, had left Paris, Charles I. was executed." These two letters are dated "Saint Germain, 2 Fevrier, 1649," corresponding in fact with the 23rd of January, 1648-9 in England; and as the king was executed on the 30th January, 1648-9 (according to the English computation), in all probability there was time for the messenger to have arrived in London between the 23rd and 30th of January. That the alteration from the Julian, or old style, to the Gregorian, or new style, was not made in England until the year 1752, is a fact which has evidently been overlooked. When the adoption of the Gregorian, or new style, into Great Britain was decided upon, a Bill (24 George II. 1751, cap. 23), which Mr. Bond quotes at length in his preface, was passed, and excited general unpopularity. Hogarth, in his painting called "*The Election Dinner,*" has introduced a placard, illustrative of the feeling prevalent amongst the majority of the people, bearing the words, "Give us back our eleven days." To notice in detail each portion of the book would occupy more space than is at disposal; it may, therefore, suffice to state that the more important features are, the information relating to the time of the adoption of the new style in various countries and states; the concise and excellent tables for finding Easter Day; the tables of regnal years; the French revolutionary calendar, and comparative tables of dates and days of the English calendar and the revolutionary calendar, and the perpetual calendar, which has been noticed already in this *Journal*. As a specimen of typography, the book reflects the greatest credit on Messrs. Whittingham and Wilkins. From the foregoing remarks it will be seen that the work is invaluable to persons engaged in the law and literary pursuits, and affords an amount of information interesting to the general reader.

Notes.

CHIMNEY SWEEPING.—It is stated that our present system, in which the machine heads or brushes are formed of woody fibre, is very imperfect for thoroughly cleansing the chimneys, especially in removing the hard lumps of soot which accumulates in them. A new brush has been invented, in which the woody fibre of the brush or head is replaced by steel. The brush itself is a hollow tube of iron, on to which is loosely put four box wood collars about half an inch thick, each having a circular groove in it, for the insertion of numerous finely-tempered steel bars, which radiate from the centre of each collar; the four being firmly bolted together by suitable brass work; this forms an elastic brush, closely resembling those in common use, but with this essential difference, the steel bars, being very elastic, penetrate the whole and every part of the aperture of the chimney in their ascent, no matter how awkwardly built, and allow the light soot to fall through them, and do not put it on the roof; and in their descent thoroughly remove all the hard, so that

there is none left in the chimney to take fire. The inventor, Mr. Thomas Welton, urges this as a manifest advantage over the usual machine; and, in addition, enumerates the following advantages:—It will promptly extinguish a fire in the chimney without damage to the brush. It will core a new chimney without climbing. It can be easily taken to pieces and repaired at a trifling expense by almost any person. It can have a ball and chain attached, so that it may be used from the roof. It fits the brass joints and canes at present in use. It will in many cases cheaply cure a smoky chimney by simply keeping it clean. It will at once, by its use, arrest the accumulation of the hard, tarry masses of soot in kitchen chimneys, builders' workshops, and other buildings where wood, refuse of vegetables, spillings of fat, bones, cuttings of leather, and bituminous coal are burned.

CANADIAN RAILWAYS AND TELEGRAPHS.—The government return for the year 1865 shows that there were in that year 2,148 miles of railway in Canada open for traffic. Their cost has been 121,543,189 dolrs. The receipts for 1865 amounted to 10,910,678 dolrs. The total working expenditure was 5,778,343 dolrs. Renewals cost 1,356,769 dolrs. The Grand Trunk line, 1,377 miles in length, had 38 deaths by accident in the year; the Great Western, with 345 miles, 15; the Northern, with 97 miles, 5. There are three telegraph companies at work in Canada—the Montreal, the Provincial, and an American company, the Vermont and Boston, which has 43 miles of telegraph line in Canada. The total length of the lines in 1865 was 4,978 miles; the number of messages sent 479,331.

NITRO-GLYCERINE FOR BLASTING.—Some interesting experiments have lately been made in the canals of Neuchâtel with nitro-glycerine, in order to detach some large blocks of rock on the right bank of the Areuse, for the purpose of constructing a dam across the river, to prevent the materials occasioned by landslips being carried down by the floods. The first hole was drilled half-way up the side of the mass of rock facing the river, 21 feet in depth and two inches in diameter, and was charged with only six pounds of nitro-glycerine; the block of rock that was detached was about 300 cubic metres. A great part of the debris fell into the river.

OLDEST NEWSPAPER IN EUROPE.—At Ghent (Belgium) there is a Flemish newspaper published, the *Gazette van Gend*, which, perhaps the oldest in Europe, will have been in existence for the last two centuries on the 1st January, 1867. As a souvenir of this anniversary the subscribers are to receive a copy of the oldest number at present in existence. It bears the date of 8th September, 1667. The copies, which have been made by means of photography, have succeeded so well, that it is difficult to distinguish the copy from the original.

JOINERS' WORK.—An importation of joiners' work has lately been made into this country from Stockholm, consisting of panelled doors, jamb-linings, architraves and skirtings, machine-made and well put together, of excellent workmanship and of first-rate material. They are made to English sizes, and have been offered for sale at prices considerably below those which are given for English work and material of the same quality. It is understood that the machines which have been employed in making them are of English manufacture, imported into Sweden.

PARIS EXHIBITION OF 1867.—It appears that the Emperor has asked the King of Prussia to send one of his model schools to the Exhibition; accordingly, not only will there be the *fac-simile* of a Prussian village school, but the master's house and the playground. The school-room will contain the books, maps, copy-books, &c., in present use in every Government school of that kingdom, besides specimens of essays, extracts, &c., actually done by Prussian school children. Those who take an interest in popular education will be able to judge of the advances of instruction in that kingdom.

POPULATION OF PARIS.—The number of inhabitants at the present time in Paris is 1,825,274. The census made at different times give the following numbers:—

	Inhabitants.
In 1292	215,861
1553	280,000
1718	509,000
1755	576,000
1784	680,000
1800	547,756
1817	713,966
1841	935,261
1846	1,053,897
1851	1,053,262
1861	1,696,131

As to the number of houses in Paris, the author of *Paris, Ancien et Nouveau*, reckons in 1685, 23,223 houses facing the street, not counting those in courts or gardens. Sauval, in 1733, gives 25,000 houses in round numbers. Germain Brice, in his *Description de Paris*, only gives 22,000 in 1752. M. Husson, in his book the *Consommations de Paris*, remarks on the inaccuracy of Sauval, who gave the number of houses in Paris as 25,000, nineteen years previous to Germain Brice, who gave 22,000 only. The *Miroir de l'ancien et du nouveau Paris*, published in 1807, gives 30,000 houses. In 1812, the *Dictionnaire des Rues de Paris*, by La Tynna, reckons 29,400; this is evidently an exaggeration, as by the official census taken in 1817, there were only 26,801; in 1841, 28,699; in 1846, 30,221; in 1851, 30,770; and in 1855, 31,650.

EXHIBITION AT PERNAMBUCO.—The Exhibition at Pernambuco, that was held during the month of October, was closed on the 20th of that month, as the articles, selected by a special commission to be sent to the Paris Exhibition, had to be first sent to the Exhibition at Rio Janeiro, where a fresh selection will be made, to decide which are to be sent to France. As there is but little manufacturing industry at Pernambuco, the articles exhibited were but few, and of little interest. The natural products, on the contrary, were numerous and important. Without mentioning cotton, coffee, and sugar, of which there were magnificent samples, there was a fine collection of woods, textile plants, flour prepared from the banana, arrowroot; a kind of vegetable fibre, admirably adapted for the manufacture of ships' cables, being indestructible by sea water; a clay of a whiteness and unexceptionable purity, suitable for the manufacture of porcelain; the carnauba, a material from which candles of a tolerably good quality are made, and which is also used by sculptors and medal engravers, on account of its plastic qualities and charming yellowish-brown tint; a considerable quantity of well-known medicinal plants, the greater part of which are extensively used in Europe. The collection of woods alone well repaid a visit, amongst which the *Secupira* is especially worthy of note, as being well adapted for indestructible railway sleepers, a specimen having been kept under water for eight years, and being as sound as when first cut from the tree. Amongst the vegetable tissues, those of macaiba, of tucum, of canapixo, and of banana; the first, especially, are of an extreme fineness, and, at the same time, of great resistance; a fishing-net made of macaiba thread would last a great deal longer than one of common twine, and it is evident that very beautiful and solid fabrics might be manufactured from it.

Correspondence.

INDIAN ARCHITECTURE.—SIR,—I should have been very glad to make a few observations on Mr. Fergusson's paper, had I not feared to protract the discussion. From the time that Mr. Fergusson first brought forward the subject of Indian architecture, I have always

felt that it is one of great importance in relation to the promotion of art. It illustrates the catholicity of art, and being, as Mr. Fergusson says, free from our own conventional associations, it enables us to study principles without prejudice, and more particularly to ascertain the characteristics of beauty. Beauty is assuredly no recognisable feature in the architecture of India. As to the indispensable connection of fitness and utility with beauty in Indian and other architecture, I am less confident. Forms and details in Indian architecture have no necessary relation to utility, whether they are beautiful or otherwise. Mr. Fergusson is justified in including in his scope Mussulman architecture, for the reasons he has stated, and I can confirm some details. The Mussulman system is not an abolition of previous systems, but a continuation of them. Hence, in religious theories and practices, in jurisprudence and in administration, in poetry, in architecture, and in numismatics, we trace the influence of preceding nations and of the localities in which the new worship is introduced. Hence the necessary distinctiveness of style in Egypt, Spain, Persia, and Turkey. In Turkey, as he says, some buildings for Mussulman worship are simply conversions of Byzantine edifices; others are based on them; Greek architects were in the first instance employed, and now, in many cases, Armenian architects and artists. These architects and artists, whether Mussulman or rajah, are of the class described by Mr. Fergusson—they read little, they draw little—but they study nature, and employ experience and common-sense; and their expedients, handed down from ages and consecrated by experience, are well deserving of attention. It is thus that schools of art are maintained now as in the middle ages—in some cases by the practitioners of the arts, in some cases by monastic institutions, as by members of the bodies of dervishes. All these considerations bear upon the ethnographic value of architecture. This, with other circumstances, was well developed by Mr. Fergusson in his uncompleted works on the philosophy of art, and especially of architecture; and it illustrates the principles upon which architecture and art generally are to be studied. It must be, as he has shown, by observance of the general connection of all art and knowledge on one basis of the unity of science and truth. We shall elevate architecture by bringing it into closer communion with the great body of science, and by bringing to bear upon it the resources and appliances of the world of knowledge. Architecture is, undoubtedly, a great instrument for ethnography, neither more nor less so than philology, but under the same conditions, and this leads me to endeavour to define more forcibly than Mr. Fergusson did, the ethnographic value of architecture. We need no more expect from architecture than from language the functions of precisely determining the race of a people. Architecture, like language, is communicated wholly or partially. Greek architecture or Greek language may be used by an alien people, but we have two results—first, the historical incident of the communication of this Greek element; and, second, its modification by the people to whom communicated. Architecture resembles in its functions the literary functions of language. Just as technical words of Greek or Arabic are communicated to other languages, so are the elements of art; and wherever we find distinctions in this respect we must look for ethnographic differences in the source or origin, in the races to which communicated, or perhaps for both together. This suggests itself with regard to the Hellenic and Ionic art. Hellenic art may have resulted from the adaptations of Egyptian forms by an Hellenic people—Ionic, from the adaptations of Assyrian forms by a people of Asiatic constitution. Whether as regards the past or the present, Indian architecture merits study. For the past it enlists the scholar; for the present, as being a living school of architecture and art, it calls upon the practical man to study and apply its principles.

Until we succeed in creating in England a living school of art, we shall still, as we do now, halt short of a satisfactory result, with all the labour and all the effort we have applied.—Yours, &c., HYDE CLARKE.

STORM SIGNALS.—SIR,—I have learnt with much regret the recent decision of the Board of Trade on storm signals, and think their circular should not pass altogether without remark. Admiral Fitzroy was a man who spent a lifetime in the study of meteorology as applied to weather prognostics; and towards the close of his life established a method of signalling on the coast the approach of storms, with a view to caution our seafaring population against approaching danger. The thing is organised, signals erected, the people to a certain extent used to them, and it seems a pity that all he has done should now be abolished; it seems a slur upon the memory of a man who has doubtless done much good in calling the attention of the people to the great use of the barometer as a weather-glass. Might not the signals be under the care of the local government, and the rules for using them given by the Board of Trade or some scientific body? We are told, in answer to that query, that these warnings are founded on rules mainly empirical, and, therefore, should not be issued under the superintendence of a scientific body. Admiral Fitzroy says, in his report published in May, 1864, "That we have proved experimentally how winds and weather may be foretold with general accuracy for two days, at least, in advance, our reports since 1861 have shown." Now, if I were told that such prophecies were "founded on rules mainly empirical," I should say, no doubt of it; the Admiral certainly very much overshot the mark there; but with storm warnings the case is different altogether. By the barometer we have never-failing indications of great storms, and it is only great storms that the sailor fears; moreover, as it would be necessary to lay down certain definite rules for the guidance of those in charge of storm signals, I would suggest that it should be an instruction to them to hoist a signal "Caution," whenever the barometer is below 30 inches, and falls at the rate of three hundredths per hour; and one of "Danger" whenever it falls at the rate of five hundredths per hour; and that the reasons why these signals are hoisted should be published. As I think that Admiral Fitzroy's judicious efforts to save life should not be altogether set aside, I would suggest to those in authority that this proposition should receive their consideration, feeling satisfied that it is altogether free from the charge of empiricism.—I am, &c., ROBT. H. C. WILSON.

 Piston-rods, packing—3200—J. Barwick and S. Tyndall.
 Portable cases—3019—N. M. Marin.
 Powder shaks—2198—C. M. Fontenoy and J. N. Dogfield.
 Printing machines—3196—R. and H. Harriell.
 Printing surfaces by photography, preparing—3113—R. H. Courtenay.
 Projectiles—3204—P. Palmer.
 Railway breaks—3077—J. and W. Kitchen, and S. Samuels.
 Railway crossings—3202—J. and E. Firth.
 Railway engines and carriages, connections between—3144—W. Butler and A. Dalgety.
 Railway trains, signalling apparatus for—3182—J. Smeeton.
 Railways, fog signals upon—3166—T. Barker.
 Reaping machines—3031—T. Wardlaw.
 Roads—3379—W. H. P. Gore and E. Gore.
 Rugs, &c.—2884—E. Huxley.
 Safety lamps—3045—B. Thomas.
 Salts, soda and potash—3097—J. K. Leather.
 Shades—3085—F. Tyerman.
 Smoky chimneys, preventing—3188—D. S. Chater.
 Submarine excavations—3026—W. E. Newton.
 Sugary substances, saccharifying—3146—E. T. Hughes.
 Telegraphic despatches, confirming—2977—E. J. Payne.
 Textile fabrics, cleansing—2967—W. S. Macdonald.
 Vessels, holds, discharging bilge water from—3176—A. Herman and H. Brethauer.
 Vessels, raising sunken—3067—T. McComas.
 Wadding—3103—W. E. Gedge.
 Water, purifying—3055—C. J. Wahab.
 Weaving, looms for—3190—E. L. Fraire.
 White lead—3133—W. R. Lake.
 White lead—3180—H. A. Bonnevillie.
 Yarns—3116—J. H. Johnson.

INVENTION WITH COMPLETE SPECIFICATION FILED.

Nails—3328—W. R. Lake.

Journal of the Society of Arts.

FRIDAY, JANUARY 4, 1867.

Announcements by the Council.

ORDINARY MEETINGS.

Wednesday Evenings at Eight o'clock :—

JANUARY 16.—“On Mercantile Marine Legislation, as affecting the Number and Efficiency of British Seamen.” By Captain TOYNBEE, F.R.A.S.

JANUARY 23.—“On the Iron Permanent Way used on German Railways.” By T. A. ROCHUSSEN, Esq.

JANUARY 30.—“On Artificial Illumination.” By D. N. DEFRIES, Esq.

CANTOR LECTURES.

The following is the syllabus of the course of Six Lectures “On Pottery and Porcelain,” illustrated by specimens of various manufactures, and by photographs and diagrams, to be delivered by William Chaffers, Esq. :—

LECTURE I.—MONDAY, JANUARY 21, 1867.

ANCIENT POTTERY.—Introduction. Assyria and Chaldea, Egypt, Greece, Etruria, Rome, &c.

LECTURE II.—MONDAY, JANUARY 28.

MAIOLICA.—Italy, Spain, Persia, &c.

LECTURE III.—MONDAY, FEBRUARY 4.

FAYENCE.—France, Spain, Portugal, Russia, Sweden, Denmark, &c.

GRES OR STONE WARE of Germany and Flanders. DELFT WARE, &c.

LECTURE IV.—MONDAY, FEBRUARY 11.

ORIENTAL PORCELAIN.—China, Japan.

LECTURE V.—MONDAY, FEBRUARY 18.

EUROPEAN PORCELAIN.—Italy, Germany, France, Holland, Belgium, Russia, Poland, &c.

LECTURE VI.—MONDAY, FEBRUARY 25.

ENGLISH POTTERY AND PORCELAIN.—Early History, continued to the beginning of the 19th century.

The lectures will commence each evening at eight o'clock, and are open to members, each of whom has the privilege of introducing one friend to each lecture.

A new list of members of the Society has been printed, and any member can have a copy sent to him on application to the Secretary.

SUBSCRIPTIONS.

The Christmas subscriptions are due, and should be forwarded by cheque or Post-office order, crossed “Coutts and Co.,” and made payable to Mr. Samuel Thomas Davenport, Financial Officer.

PRIZES TO ART WORKMEN.

The works sent in competition for the Prizes offered this Session will be placed in the Great Room, for the inspection of Members and their friends, on and after Wednesday next.

The following is a catalogue of the works received :—

FIRST DIVISION.

WORKS TO BE EXECUTED FROM PRESCRIBED DESIGNS.*

1. CARVING IN STONE.—Panel, after chimney piece by *Donatello*, by J. Daymond, Jun., 4, Edward-street, Vauxhall-bridge-road, S. Price £8.
2. Ditto, Gothic bracket, by E. J. Price £5.
3. Ditto, by John Edward Daly, 33, Medway-street, Westminster, S.W. Price £15.
4. Ditto, by John Barker, 4, John-street, Marlborough-road, Chelsea, S.W. Price £12.
- *5. Flowers carved in Caen stone, by W. H. Holmes, 101, Dean-street, Soho, W.
- *6. Head, in marble, “*Ecce Homo*,” by J. P. F. Jones, 4, Surrey-villas, Nunhead-green, Peckham Rye, S.E. Copies made for £5.
- *7. Basso relievo, in marble, representing the Arts and Sciences, by the above. Price when finished £20.
- *8. Ditto, in marble, by the above.
- *9. CARVING IN STONE.—“Christ blessing little Children,” by H. Francis, Reigate-heath, Surrey.
- *10. Ditto, “First Steps in Life,” by the above.
- *11. Ditto, specimens of letter-cutting in stone, by the above.
- *12. MODELLING IN PLASTER.—National emblems, arranged by J. Daymond, Jun., 4, Edward-street, Vauxhall-bridge-road, S. Price £8.
- *13. HEAD IN CAEN STONE.—“Winter,” by T. Herne, 22, Werrington-street, Oakley-square, N.W.
14. CARVING IN WOOD, after design by *Holbein*, by T. E. Mayle, 33, James-street, Stockwell, S.
- *14a. CARVING AND GILDING.—A Glass Frame, designed and carved by W. M. Holmes, principal part of the Flowers by Mouatt (deceased), gilt in double mat and burnished by Messrs. Buchholz, Venning, Chowne, sen., Ettershank, Connor, and Allen; exhibited by J. H. Wyatt, 101, Dean-street, W.
15. REPOUSSÉ WORK IN METAL.—Executed in iron, after the Martelli bronze mirror case at South Kensington, by G. Page, 39, Douglas-street, Northampton-road, Clerkenwell, E.C. Price £20.
16. Ditto, by J. S. Nicholls, 4, Everilda street, Hemingford-road, Islington, N. Price £5.
- 16a. Ditto, on silver cup, by X. Y. Z. Price £30.
17. Ditto, on silver, by V. U. (Unfinished.)
18. Ditto, “Raphael’s Three Graces,” in silver, by Joseph Hakowski, 59, Frith-street, Soho-square, W. Price £20. Copies at £15.
- 18a. Ditto, “Three Graces,” in silver, by X. Y. Z. Price £12.
19. Ditto, “Three Graces,” in copper, silvered, by Charles Yerman, 14, Gerrard-street, Islington, N.
20. Ditto, “Three Graces,” in copper, by Alexander Dufour, 36, Cleveland-street, Fitzroy-square, W.
21. Ditto, “Three Graces,” in copper, by W. Holliday, 14, Nailour-street, Islington, N. Price £15.
- *22. Ditto, Portrait of the late Viscount Palmerston, by the above. (Sold.)
- *23. Ditto, Group, in copper, “Abundance,” after *J. Van Eycken*, by Thomas James Bowman, 3, Rheidol-terrace, St. Peter’s, Islington, N. Price £7 10s.
- *23a. Ditto, “Raffle-leafage.” Price £5.

* Those marked with an asterisk (*) are not after the prescribed designs.

24. **HAMMERED WORK IN BRASS.**—Adapted for use as a bracket, by W. Mansfield, 72, Bishop's-road, Camberwell New-road, S.
25. Ditto, by E. Millward, 35, Little Clarendon-street, Somers-town, N.W.
26. Ditto, by Albert Edward Millward, 13, New Compton-street, Soho, W.
27. **HAMMERED WORK IN IRON.**—Ditto, by Alfred Millward, 35, Little Clarendon-street, Somers-town, N.W.
28. Ditto, by G. H. Price £5 10s.
29. Ditto, by James Gwillim, 19, Sidney-square, Mile-end, E. Price £15.
- *30. Ditto, by the above. Price £20.
- 30a. Panel for a screen, by W. Letheren, Lansdown Iron Works, Cheltenham.
- *31. Ditto, by William Cunliffe, St. Peter's-street, Burnley. Price £5 6s.
- *32. Ditto, Bread-basket, designed by A. W. Bloomfield, Esq., architect, for East Sheen Church; executed by T. Winstanley, 7, Stanhope-street, Clare-market, W.C. Price £12.
33. **CARVING IN IVORY.**—Medallion portrait of Flaxman, by J. W. Bentley, 22, Sherwood-street, Golden-square, W. Price £10.
24. **CHASING IN BRONZE.**—Bust of "Clytie," by Frederick Beech, 52, Great Colmore-street, Birmingham. Price £16 16s.
35. Ditto, by H. B. Batchelor, Jun., 149, St. John-street-road, E.C. Price £14.
36. Ditto, by T. Nichols, 4, Everilda-street, Hemingford-road, Islington, N. Price £15.
37. Ditto, Ornament, after *Goutier*, by R. Reynolds, 15, Oak-village, Kentish-town, N.W. Price £15.
38. Ditto, Ornament, after *Goutier*, by G.
39. Ditto, Ornament, after *Goutier*, by H. J. Hatfield, 16, Alfred-street, Tottenham-court-road, W.C. Price £15.
- *40. Ditto, Statuette of "Caractacus," by the above.
- *41. Ditto, Group, "Jacob Wrestling with the Angel," by the above.
- *42. Two miniature frames, raised and chased by the above.
43. Engraving on metal, after arabesques, by G. S. B. Price £3 10s.
44. Ditto, by G. Berry, 31, Brewer-street, Golden-square, W. Price £4 4s.
45. Ditto, by William Rowe, 4, Larkhall-lane, Clapham, S. Price £3.
- *46. Ditto, by Gilles McKenzie, Tudor-street, Sheffield.
- *47. Ditto, by the above.
- *48. Ditto, by the above.
- *49. Ditto, on silver cup, by the above.
- *50. **ENAMEL PAINTING ON COPPER.**—"Madonna and Fish," after *Raphael*, by Frederick Lowe, 13, Wilderness-row, E.C.
- *51. Ditto, "Boy and Doves," after *Raphael*, by Walter J. W. Nunn, 10, Gardour-street, Bromhead-street, Commercial-road, E. Price £5.
52. **PAINTING ON PORCELAIN.**—"Two Children," in *Raphael's* cartoon of "Lystra," painted on a vase, by Edwin Saunders, Messrs. Battam and Son, Gough-square, E.C.
53. Ditto, "Two Children," painted on a vase, by W. J. W. Nunn, Messrs. Battam and Son, Gough-square, E.C.
54. Ditto, "Two Children," by F. D. Bradley, West-parade, Mount-pleasant, Stoke-upon-Trent. Price £4 4s.
55. Ditto, "Two Children," by John Slater, Field-place, Stoke-upon-Trent. Price £3 3s.
56. Ditto, "Two Children," by William Slater, Field-place, Stoke-upon-Trent. Price £3 10s.
57. Ditto, "Two Children," by William H. Slater, Oakhill-cottages, Stoke-upon-Trent. £5 10s.
58. Ditto, ornament, by F. D. Bradley, West-parade, Mount-pleasant, Stoke-upon-Trent. £5 5s.
59. Ditto, Ornament, by Alexander Fisher, 5, Clyde-street, Stoke-upon-Trent.
- *60. Ditto, Ornament, plateau in blue, after design by *Maestro Ludovico*, by the above.
- *61. Ditto, Pair of door finger-plates, majolica style, by Miss L. Leila Hawkins. Price £5 6s.
- *62 & 63. Ditto, Circular-plates, subjects from the "Signatura" ceiling, by W. P. Rhodes, School of Arts, Stoke-upon-Trent.
64. **DECORATIVE PAINTING, Ornament**, by John Slater, Field-place, Stoke-upon-Trent. Price £3 3s.
65. Ditto, by 4.
66. Ditto, by Charles Pfänder, 28, Bayham-street, Camden-town, N.W. Price £6 5s.
67. Ditto, after a picture frame in the South Kensington Museum, by the above, £13 10s.
68. **WALL MOSAICS**, after *Bertini* of Milan, by Samuel Cooper, 2, Waterford-terrace North, Walham-green, W.
69. **DIE SINKING**, after *Wyon's* "Head of Prince Consort," by W. E. Bartelle, 4, Chichester-place, Wandsworth-road, S. Price £15.
70. Ditto, by J. W. Minton, 9, Royal Mint, E.C. Price £20.
71. Ditto, by Albert Heness, 3, Egbert-street, St. George's-road, N.W. Price £10 10s.
72. **GLASS-BLOWING.**—Exhibited by Dr. Salviati, 431, Oxford-street, W. Produced by *Marco Seguso*, of Murano.
73. **BOOKBINDING.**—After an Italian specimen, "Quintus Curtius," by John Jeffrey, 23, Upper Marylebone-street, W. Price £7.
- *74. Ditto, Early Florentine style, "Histoire de la Porcelaine," by Louis Genth, 30, Brydges-street, Covent-garden, W.C. Price £35.
- *75. Ditto, "Œuvres de Lorize Labe," by the above. Price £8 8s.
- *76. Ditto, case specimen of Mosaic, by the above, £10 10s.
77. **ILLUMINATIONS.**—Specimen by Charles Pfänder, 28, Bayham-street, Camden-town, N.W. Price £5 10s.
78. Ditto, by Miss Mary R. David, 4, Anderson-street, Chelsea, S.W. Price £5 5s.

SECOND DIVISION.

WORKS TO BE EXECUTED WITHOUT PRESCRIBED DESIGNS.

WOOD CARVING.—(a.) *Human figure in the round, in alto or in bas relief. Animals or natural foliage may be used as accessories.*

79. "Egeria," by J. W. Gould, 33, Bayham-place, Camden-town, N.W. Price £15.
80. "Cynthia," by the above. Price £10.
81. "Autumn," Female Head in satin wood, by G. F. Bridge, 3, Vincent-square, S.W. Price £5 10s.
82. A Finial carved in oak, by R. Davison, 28, Winchester-street, South Belgravia, S.W.
83. Original Group in walnut, "Wallace at the Battle of Stirling," by John Lucas, 82, Long-acre, W.C. Price £31 10s.

(b.) *Animal or still-life. Fruit, flowers, or natural foliage may be used as accessories.*

84. "Dog's Head," by E. Dujardin, 46, Camberwell-grove, S. Price £2.

(c.) *Natural foliage, fruit, or flowers, or conventional ornament, in which grotesque figures or animals may form accessories, preference being given where the work is of an applied character for ordinary decorative purposes, as representing commercial value.*

85. Panel. "Bird and Flowers." by E. Dujardin, 46, Camberwell-grove, S. Price £10.
 86. Panel in Lime Wood, by J. S. Booth, 19, Malden-road, Kentish-town, N.W. Price £10 10s.
 87. Camera Truss Leg, by R. Baker, Messrs. Holland and Sons, Gillingham-street, Pimlico, S.W.
 88. Vase of Flowers and Conventional Bracket, by G. H. Bull, 16, Millman-mews, Millman-street, W.C. Price £23.
 89 & 90. Design for Damask Table Linen, by Miss A. Kemp, 27, Hereford-square, Brompton, S.W. Price of No. 89, 15s.; No. 90, 10s.
 91. Design for a Book Cover, by Miss Mary R. David, Price £1 10s.
 92 & 93. Designs for Damask Table Linen, by the above. Price 10s. each.
 94 & 95. Works in Oil, by Charles Maiben, 40, West Hill-street, Brighton.

WORKS EXECUTED AND FINISHED BY MACHINE.

Exhibited by Charles J. Hill, 6, Albany-street, Regent's-park, N.W. :—

- 96—98. Three Groups in Ivory. Price £15.
 99. "Head of H.M. the Queen," in Ivory. Price £5.
 100. "Greek Head" in Steel. Price £8.
 101. Ditto, in Malachite. Price £5.
 102. Case with Two Proofs from Engravings on Steel for Surface Printing, and two "Medusa's Heads." Engravings and dies in hand. Price £4 each.

Proceedings of the Society.

FOOD COMMITTEE.

The first meeting of this Committee took place at the Society's House, on Friday afternoon, 21st Dec., Mr. HUGH C. E. CHILDERS, M.P., in the chair. There were also present Mr. John Bell; Mr. Harry Chester; Mr. W. Ewart, M.P.; Mr. W. H. Michael; Lord Robert Montagu, M.P.; Mr. F. Parish; Mr. F. S. Powell, M.P.; Mr. Benj. Shaw; Mr. Edward Wilson; Mr. G. F. Wilson, F.R.S.; and the Rev. C. Wright.

Mr. HARRY CHESTER, having been requested by the Chairman to open the proceedings by an explanatory statement, commenced by saying that, when he moved in the Council of the Society of Arts for the appointment of this Committee, to investigate the very grave and difficult questions with which it was to deal, he was well aware that they could not be satisfactorily dealt with except by a committee selected with more than ordinary care, and presided over by a chairman more than ordinarily capable of guiding them by his experience and wisdom. He was happy to say that the composition of the Committee left nothing to be desired; and that the Chairman of the Committee, the Right Hon. Henry Austin Bruce, M.P., was singularly well-fitted for his post. The subject of the food of the people had for some time past occupied the attention of the Council of the Society, and the circumstances of the present day made it more than usually expedient to take some more definite action upon it. They were all aware that the Privy Council and other public authorities had published statements showing that the people of

this country were insufficiently fed; that there was a great want of sufficiently nutritive food. This was not merely a question of humanity and charity; it was a very grave national question, vitally affecting "arts, manufactures, and commerce," and the very sources of national strength. The first thing was to see clearly in what directions this committee could usefully act, and what it must necessarily avoid. Nothing must be done to interfere in any way with the operation of the laws of political economy, nor with the natural action of trade; but the Society of Arts might in this as in other matters do good service by ventilating the subject, by collecting and distributing information, by repeatedly calling attention to the principal needs and the best suggestions for supplying them, by offering medals and premiums for various inventions of improved processes, and generally by bringing the resources of science to bear on the wants and difficulties of those branches of arts, manufactures, and commerce, which are concerned in the production, importation, preservation, and preparation of articles suitable for food. His hope that this was a subject with which the Society of Arts might usefully deal had been greatly encouraged by the cordial manner in which those noblemen and gentlemen who had been invited to serve on the committee had responded to the invitation. The most lively interest had been expressed; and the two or three who had declined to serve had given sufficient reasons for so doing. It would no doubt be observed that, with the single exception of Professor Bentley, a member of the Council, there were no medical men on the committee. This arose from no inability to appreciate the importance of medical knowledge and experience in such a matter, nor from any unwillingness on the part of the medical profession to assist the Committee. From many of the most distinguished members of that profession the heartiest offers of assistance had been received; but the truth was, that the medical experts were so numerous, and perhaps the differences of opinion among them were so considerable, that, if any were invited to serve on the Committee, it would be invidious to select a few, and not desirable to appoint many, for this might give too professional a character to the Committee; it was therefore resolved to seek their assistance rather as witnesses than as judges; and to invite them to state in writing or *à viva voce* the results of their knowledge and experience. The Committee had been promised a great deal of very valuable assistance of this kind by many distinguished members of the profession. It would be very important to give the utmost possible publicity to the proceedings of the Committee, and to the suggestions with which it might be favoured. He hoped that henceforth, for some months, every number of the Society's weekly *Journal* would contain some publications from the Committee, so that the subject might be kept constantly in view. The Society had more than 3,000 members, and a large number of Institutions and Local Educational Boards in union with it. To all of these the *Journal* was sent regularly, and it would also be sent to each member of this Committee, whether a member of the Society of Arts or not. He suggested that the co-operation of the principal medical journals, and of the press generally, should be invited. Slips of what the Committee proposed to publish in the Society's *Journal* might be sent simultaneously to all such journals as might be willing to assist in ventilating the subject. The Board of Trade was in possession of a vast amount of valuable information upon points into which they would have to inquire; and he was authorised by Sir Emerson Tennant to say that all such information, and all such assistance as that Board could afford, would be most cordially afforded to the Committee. The Secretaries of State for Foreign Affairs, the Colonies, and India, would doubtless assist the Committee by circulating queries among her Majesty's ministers and consuls, governors, and other functionaries, respecting articles suitable for food, or modes of preparing it, which might be useful to this country. The

Acclimatisation Society had already received some valuable information of this kind through the Foreign Office, and he was sure that that Society would readily place it at the disposal of this Committee. The subjects of inquiry might be said to be of almost unlimited extent, and it was desirable to indicate at the outset a few great divisions of the subject on which it might be most useful at first to enter. It would not be well to enter upon such branches of the subject as were calculated to excite popular prejudices, such, for example, as the introduction of horse-flesh as an article of food for the lower classes. The Committee were aware that this was a subject of great interest just now at Paris. It might or might not hereafter become popular in this country, but at present the mere mention of it would tend to excite an uncontrollable prejudice against the Committee. There were four great subjects with which he thought the Committee might advantageously begin to deal:—Meat, fish, milk, cooking. The first great principle, he had almost said, of Christianity as well as of political economy appeared to be that all the world should be kin, that each part of the world should contribute to supply the wants of the rest. The home supply of meat for the population of these islands was not nearly sufficient for the due sustenance of one-half of the population. The supply of live cattle from foreign parts could never be equal to the want. Fresh meat in the natural condition could only be procured from foreign countries to a limited extent, that is, from neighbouring countries, and in favourable weather. On the other hand, millions of tons of beef and mutton were wasting in distant quarters of the earth; and science was required to devise means for so dealing with that beef and mutton that commercial enterprise might be enabled to bring it to this country in a condition suitable for food. This was an object of enormous importance. It had long occupied the attention of the Society of Arts. In 1853, when delivering the centenary address, as Chairman of the Council, he (Mr. Chester) had alluded to it, and asked why Australia should export only the wool and tallow of the sheep, and not the mutton itself to the hungry masses in this country. Of late years, no session had passed without the Society's taking some measures to call public attention to this subject. Almost every patented and other invention for preserving meat had been described, and many of them had been exhibited, in the Society's great room. In 1863 the Society had offered a medal and a prize of £70 provided by the liberality of Sir W. C. Trevelyan, a member of the Society.* Various claims had been submitted to the Council, but no award had hitherto been made; and he understood that the Council would be glad of the assistance of this Committee in making the award. To this important point, then, their attention would be turned at once. They saw daily advertised not fewer than three different kinds of *extractum carnis*, all claiming to be Liebig's *extractum*. He believed that there was not much doubt as to which of the three was the genuine article; but the Committee might cause them all to be analysed, and might give the results to the public. So much attention had lately been given to the importance of preserving and increasing the supplies of fish, that he need merely to indicate that subject as one which would abundantly reward inquiry. Mr. Ewart, and other members of the committee who flourished in the ante-railway period, must remember the immense vans, with high wheels, that used to bring fish daily to London from the Kentish and Suffolk ports. They were thought to travel at a wonderful rate, and they were called into existence by

the Society of Arts, which had offered medals and prizes, and otherwise excited a spirit of enterprise "for the better supplying of the metropolis with fish." The better supply of milk was a vital question. He did not now allude to that fearful source of mortality among the infant poor, the deficiency of breast milk. He alluded to the fact that, as a general rule, the working classes of this country, even in dairy districts—and perhaps more there than elsewhere—were unable to procure the milk diet which was necessary to the growth of healthy bodies. In some districts there was an absolute insufficiency of milk; in others there was an abundance of it, but it was turned into butter and cheese, and the poor could get none to drink. He believed that the Ladies' Sanitary Association had published some useful suggestions for dealing with the latter case; and, if so, the Society of Arts might with advantage give additional publicity to those suggestions. There was plenty of kind feeling in England, but people did not always know "how to do it." It had struck him as somewhat unfortunate that, while the supply of milk, as milk, was insufficient for the wants of the people of England, such large quantities of English milk should be converted into cheese. Cheese, of course, was a valuable article of food, very nutritious to those who could digest it; but cheese might be brought from a distance, while milk could only be consumed, as milk, within a very limited area. Mr. J. C. Morton in his paper on "London Milk," last session,* had stated that the quantity of milk consumed by the three millions of London people was less than half the amount that, according to a good standard of food, they ought to consume; also that this was true of a very wide extent of agricultural populations; that the transit of milk by railway was injurious to it; and that consequently country-raised milk was worth less per gallon in London than London-raised milk. He gave a table showing the milk-consuming rate of various populations, and it appeared that in Devonshire the quantity of milk consumed was considerably greater per head than in any other English county. Could this superiority be a result of the common Devonshire practice of preserving the milk by clotting it? He thought that the Society of Arts might usefully press on the railway companies and milk producers the great importance of improving the present very unsuitable milk vans on which that delicate and valuable commodity was now savagely transmitted to the metropolis. He thought also that the Society of Arts might offer its medal and a valuable premium for the best method of preserving milk, so that it might be sent from greater distances than at present. Much milk, which was now necessarily converted into cheese, because it could not be kept from spoiling as milk, might then be more beneficially and profitably consumed as milk. Mr. Foster had told him of a French invention for the preservation of milk; and said that he had tasted some milk thus preserved for three years, which was perfectly sweet, and could not be distinguished from fresh milk. The Committee would do well to acquaint itself with that invention; and, if it were open to any serious objection, the Society might do good service by offering a medal and a valuable prize for a better method of preserving milk. He knew that, after all, the commercial principle, the hope of gain, was the best stimulus to invention: but all experience showed, the experience of the Society of Arts proved to demonstration, that these offers of medals and prizes had useful effects. To this day the medals granted at the Exhibition of 1851 were paraded in advertisements of all sorts of articles that were offered for sale; and this was done not merely by petty chapmen of no reputation, but by tradesmen and manufacturers of world-wide eminence. An article medalled by the Society of Arts was sure to command a market. On the subject of cooking he would

* The terms of the offer are as follows:—"The sum of £70, placed at the disposal of the Council by Sir W. C. Trevelyan, Bart., with the Society's medal, is offered for the discovery of a process for preserving fresh meat better than by any method hitherto employed, applicable to the preservation of meat in countries where it is now almost valueless, so as to render it an article of commerce and available for stores on ship board. Specimens, with detailed accounts of the process employed, must be sent to the Society."

not say many words. The Committee well knew how deplorable was the cooking among the lower, indeed among all but the highest, classes in this country. A valuable paper* had been read and well discussed before the Society of Arts, on the admirable system of "Cooking Depots," introduced at Glasgow by Mr. Corbett. That was one of the greatest boons that had been conferred on the working classes. The same system had been introduced successfully at Manchester. An attempt had been made in London, but unhappily without success. He believed that it had failed, so far as it had failed, from no inevitable causes, from no local peculiarities. There seemed to be no reason why the same system should not be carried out, on a very extended scale, in London as elsewhere; and the Committee might do a good work in collecting and collating experience on the subject, and in calling attention to it, until a second Mr. Corbett should arise with wisdom and energy enough to acclimatise the Glasgow product in the metropolis. The Committee might also represent to the Committee of Council on Education the great importance of providing instruction in cooking for the poorer classes. This surely was a subject well worthy of the notice of Her Majesty's Inspectors of Schools. This was a matter which the Society of Arts had long regarded as important. In the Society's great scheme of educational examinations, designed to encourage the education of adults among the working classes of both sexes, domestic economy held a prominent place. In that subject the Dean of Hereford was examiner. In his outline of the examination for 1867, were included "the nutritious properties of food, animal and vegetable; modes of cooking, &c.," and a benevolent member of the Council, Mr. T. Twining, had taken measures to supply a systematic course of lectures to the working-classes in different parts of London. Having particularised these four great subjects of meat, fish, milk, and cooking, he would not longer detain the committee, though he was aware that there were an almost infinite number of other useful subjects which might be specified. There were, for example, the great cereal class, vegetables of various kinds, as well as fruits, little known, but capable of being much used in this country, and that scandal of civilisation, the adulteration of food. He would now propose that the Chairman, Mr. Bruce, should be supported by two Vice-Chairmen, who might take the chair in his absence, or at Sub-Committees; and he would move that Mr. Childers, M.P., and Mr. Benjamin Shaw, a member of the Council, be the Vice-Chairmen.

This motion having been seconded was carried unanimously.

The following gentlemen were then appointed a Sub-Committee to collect information and materials, and generally to prepare for the transaction of the business of the Committee when it shall meet in February, viz.:—The Right Hon. Henry Austin Bruce, M.P., Chairman of the Committee; Mr. Childers, M.P., and Mr. Shaw, Vice-Chairmen; Professor Bentley, Mr. Harry Chester, Mr. Michael, Mr. Consul Parish, and Mr. Edward Wilson.

A general conversation respecting the objects of the Committee, and its modes of proceeding, then followed; in the course of which Mr. Michael described an invention for preserving milk which he thought successful. The milk was dried in oscillating vessels; and in that state was easily transportable, and might be kept for a long period. This method had been successfully adopted at Lord Northbrook's, and was about to be introduced on a large scale at Zurich in Switzerland.

Mr. HARRY CHESTER said that probably that invention was little known; and, if it were really valuable, this Committee might direct attention to it, but all plans for drying milk were somewhat elaborate and costly; and what he had principally in view in his remarks on

milk were means for preserving it, not during long voyages, but during such brief periods as would allow milk in its natural state to be sent to London, for example, from greater distances than was possible at present.

Mr. BELL said that, remembering the caution which they had received against running foul of popular prejudices, he would say nothing about edible snails, though the Committee knew that many drooping lives had been saved in foreign countries by the use of that singularly restorative diet. He hoped, however, that the great family of molluscs would not be entirely overlooked by the Committee, and he drew attention to various other articles much used as food on the Continent, but little known in these islands.

Mr. SHAW enlarged on the great importance of the objects for which the Committee had been formed. He said that, from his conversations on this subject with many medical men of eminence, he felt assured that any material improvement in the diet of the people would show itself unmistakably in their health and strength; and would not only enable them to resist better than at present the attacks of cholera, typhus, and other epidemics, but would diminish sensibly the mortality from consumption, heart disease, and other maladies which were in a great degree the consequences of an imperfect nutrition.

The Committee then adjourned.

The sub-committee met on Friday, the 28th Dec., at 4 o'clock; and is to meet again this day, Friday, at 3 o'clock.

The following memorandum has been furnished by a member of the Committee:—

Mr. Simon, the principal medical officer of the Privy Council, says, "That no sanitary necessity can be more real than the common animal need of proper food—that no morbid influence can be of worse import to life than mere privation of nourishment. These are propositions which every one feels to be true, when they are illustrated in individual cases of death by starvation, or in those national extreme sufferings of scarcity which constitute famine. But the propositions are not exclusively true in that utmost range of their application. In degrees far short of what is popularly known as starvation or famine, insufficiency of nourishment may bring very hurtful consequences to health. Local defects or local peculiarities of diet may exercise important influence in determining or colouring particular localisations of disease; and, generally, it may be said that, in order justly to estimate the sanitary circumstances of a people, scientific regard must be had to the quantity and quality of the people's meat and drink."

This being so, let us see what are the facts in respect to large classes of the English people.

In 1863, the Privy Council ordered an inquiry to be made into the diet of the lowest-fed classes of the population, and in order to take the most moderate standard of comparison, the estimate adopted as to the minimum quantity of food on which life could reasonably be expected to exist was derived from what had been adopted as a practical rule for allowances to the poor during the cotton famine in the North. The rule then laid down was that, to avert starvation diseases, the weekly food of an average adult must contain at least 28,600 grains of carbon and 1,330 grains of nitrogen. The annexed table (see next page), therefore, speaks for itself:—

In only one of the examined classes of indoor operatives did the average nitrogen-supply just exceed, while in another it barely reached the estimated standard of bare sufficiency, and in two classes there was defect—in one a very large defect—of both nitrogen and carbon.

Turning from these to the agricultural population, we find that the inquiry tended to show that more than a fifth of the examined cases had less than the estimated

Class.	No. of Families estimated.	Average weekly supply for each adult.	
		Carbon.	Nitrogen.
Silk-weavers	42	27,620	1,151
Needlewomen	31	22,900	950
Kid-glovers	10	28,623	1,213
Shoemakers	21	31,700	1,332
Stocking-weavers ..	21	33,537	1,316
Average		28,876	1,192
Minimum allowance advised for unemployed cotton operatives }		28,600	1,330

bare sufficiency of carbonaceous food, while in three counties insufficiency of nitrogenous food was the average local diet.

These results are put forward by Mr. Simon as approximate only, but in their general character they derive abundant confirmation from other testimony, and there can be little doubt that their substantial truth is beyond question.

Dr. Brown, in a little work on "The Food of the People," published 1865, says:—"The plague-spot, the skeleton in the closet of England is, that her people are underfed. When I make this declaration it will be at once understood that in speaking of people, I do not speak of the upper classes, of the middle class, or of highly-skilled artisans, who may be said to be in a state of transition—to be passing from the labouring into the middle class. I speak of the strictly labouring class and their families. My opportunities of observing this class have been by no means narrowly limited. For a long series of years I have been physician, and I trust not an unobserving one, to two great charitable institutions, each of them in a populous sea-port, comprising various manufactories, and, of course, many of the labouring class—the Sunderland Infirmary and Dispensary, and the South Shields Dispensary. In my attendance on these charities I have observed, and not without a feeling of pain, the diminishing power of English women to suckle their offspring," p. 2. Coming to the defective constitution resulting from this under-feeding, he observes:—"It is transmissible from sire to son, and is the great instrument in producing that deterioration of a race . . . which is the concomitant and cause of the decay of states. . . . We must all see that England requires for the security of her shores a well-fed and vigorous people, and that all the thought and energy she can boast should be employed for a time on the food question." p. 10.

Dr. Blakiston, of St. Leonards, in his recent work, "Clinical observations on diseases of the Heart, &c.," says:—"I cannot conclude this subject without offering a few remarks on the prevention of diseases. It has been seen that those under consideration, in common with many others, arise from a morbid state of the blood. Setting aside the influence of hereditary transmission and individual habits of life, it is clear that the condition of the blood mainly depends on that of the air breathed and the food consumed. Great efforts are being made to purify the air by improvements in drainage, ventilation, and the construction of dwellings; and much attention is bestowed on the diet of the soldier and sailor, and of the inmates of workhouses and gaols, but that of the labouring classes generally, more especially as regards the consumption of animal food, is far from being in a satisfactory state. Is it not possible to increase this supply, and economise what we already possess? How can the members of our profession be better employed than by joining to promote this good

work? First, by giving their aid and counsel to devise means for the supply of nutritious food, and for making the best use of that which is already within reach; and, secondly, by assisting the clergy and laity to instruct the wives and families of the working classes to avail themselves of the advantages which may be afforded them. By thus throwing ourselves heart and soul into this benevolent work, we shall increase our usefulness and raise our profession greatly in the estimation of the country at large."

PARIS UNIVERSAL EXHIBITION OF 1867.

BRITISH SECTION.

A distinct order of reward, of which particulars have already appeared in the *Journal*, has been "instituted in favour of persons, establishments, or localities, which, by a special organization or special institutions, have developed a spirit of harmony among all those co-operating in the same work, and have provided for the material, moral, and intellectual well-being of the workman."

These rewards consist of ten prizes, of the total value of 100,000 francs (£4,000), or £400 each, and twenty honourable mentions. One grand prize of 100,000 francs may, in addition, be awarded to the person, establishment, or locality, distinguished under this head, by a very exceptional superiority.

At the first meeting of the International Jury, held at Paris, 1st December, 1866, the following principles were adopted:—

1st. The Jury may doubtless take into account, among the facts presented for its consideration, the spirit of charity and beneficence; but it is not specially charged to reward acts of that character.

2nd. To constitute them the basis of a claim to reward, the facts adduced must have been the consequence of a free and spontaneous initiative, and not of legislative enactments.

3rd. It will not suffice that the work be praiseworthy in itself; it must at the same time be compatible with sustained and progressive prosperity.

4th. The circumstances of the position in which competitors may be found should be duly considered. To have maintained intact traditional circumstances of harmony and happiness, whilst progressing in agricultural or industrial pursuits, is a good ground of claim; but the introduction of improvements where antagonism and suffering previously existed is not less meritorious.

5th. The Jury has not thought it right to exclude from the competition individuals or societies which, although not engaged in agricultural or manufacturing pursuits, have founded durable and prosperous institutions, contributing to the propagation of good feeling and happiness, of which it is desirable to seek the best examples.

The following form must be filled up by or on behalf of any person, establishment, or institution, in the United Kingdom, for which the reward is claimed, and must be forwarded to the "Secretary, Paris Exhibition, South Kensington Museum," on or before the 20th January, 1867.*

I.—General Questions which apply to all cases:—

1. Name of the establishment:
Where situated:
Full postal address:
2. Name of the proprietor, or body of proprietors:
3. Name in full, description and address of the correspondent or Secretary of the Institution:
4. Principal object of the establishment:
5. By whom was it formed?
6. When was it established?

* That the questions should be answered as far as imperative that all should be filled up; and the whole are not applicable.

7. Have the works or the institution ever been suspended? if so, for how long, at what date, and from what cause?

8. State the number of persons at present employed, or received into the Institution—Adult males, ; females, . Young persons within the ages of and , males, ; females, . Children, males, ; females, . And the average number in each during ten years:

9. Are there any restrictions or qualifications for admission or employment in labour: namely,—

Age, and at what age? Instruction?
Apprenticeship, or other period of service?

10. What is the proportion of married females employed?

11. What regulations are made to enable them to attend to their family and domestic duties?

12. Are any arrangements made for the protection of young females whose employment necessitates their leaving home?

13. Has the establishment been remunerative or otherwise?

14. Is any pecuniary assistance received from the Government, or from any other body not participating in the profits? If so, define its nature and amount.

15. Has the establishment any special privilege, or monopoly of any kind, and what is its nature?

15a. Enclose a copy of all rules framed for the government of the establishment, or any information which may specially refer to it, and any plans of the buildings.

II.—Establishments where any description of Manufacture or Productive Labour is carried on, state—

16. Of how many partners does the establishment consist?

17. Is their pecuniary responsibility limited?

18. Is the capital divided into shares, or owned in parts? If so, how many, and of what amount, or in what proportions?

19. During the last five years, what has been the average yearly profit per cent., and in what proportion, and according to what principle, has it been divided among—

1. The partners, or shareholders.
2. The workpeople.
3. Any other person.
4. Devoted to capital, or other purposes?

20. What are the daily number of hours of work at the establishment, exclusive of meal-times?

21. What are the average weekly wages now earned?

By a family—

By a workman—

What are the highest weekly wages? What are the lowest?

22. Have any, and what, systems been adopted (payment by the piece or other) to stimulate the industry of the workpeople?

23. Have dwellings, at the cost of the establishment, been provided for the workpeople? Of what character? When erected? How many? And at what cost?

24. What are the average weekly rents paid for such dwellings?

By a family—

By a single workman—

25. Are any, and what, regulations made and enforced relative to periodical cleansing of the dwellings and workshops?

26. Is there any co-operative society, or arrangement amongst the workmen for the purchase of food or clothing, and how is the management provided and paid for?

27. Do the employers contribute in any way?

28. Is the system of truck in any form adopted? Are any payments made except in money to persons employed?

29. Is any provision made by the proprietors, or by the workpeople themselves, for medical attendance in cases of sickness; and are any, and what, allowances made to them, or in cases of death for their burial, and from what funds?

30. State the proportion, to the average of the locality, of the

Deaths of the workpeople employed—

Their marriages—

Births— Legitimate, ; illegitimate, .

31. State the average duration of life of the workpeople?

Adult males, . Adult females, . Children, .

32. State if any, and what, provision is made for the education of the workpeople and their children, and from what funds provided.

33. State what provision is made for their religious teaching.

34. State what provision is made for their mental or physical recreation.

35. Is any arrangement made to promote temperance, and what proportion of the workpeople avail themselves of it?

36. Are any plans adopted for taking charge of the savings of the workpeople?

37. How long have they been in operation?

38. What is the number of the contributors, and the average amount of their savings?

39. Are there any instances of savings invested in life assurance, and to what extent?

40. Have any, and how many, of the workpeople, by means of their savings, become possessed of houses?

41. Have they joined any trades' union, or formed any such union among themselves?

42. Have such unions had any, and what, influence upon their hours, or modes of labour, or their rate of wages?

43. Have there been any strikes among the workpeople?

44. State at what period? Of what duration? And the alleged causes?

45. By what means, and on what conditions, were they terminated?

46. Have any trade union interfered with the management of the establishment? And if so, give all particulars.

47. Has the establishment given rise to any hostile combinations among the manufactures or workpeople of the locality?

48. Has it had any, and what, effect upon the poor's rate of the parish?

III.—If the Establishment be one in which no Manufacture or Productive Labour is carried on, or forms part of the plan, state—

49. The express nature and objects of the institution.

50. By whom is it managed?

51. What is its gross annual income, and whence derived?

52. What are the annual expenses of management? And of collection where subscriptions are paid?

53. What are the number of paid officers?

54. And their salaries?

55. The conditions on which the inmates are commonly received, and the average duration of their stay in the institution.

56. The weekly cost of the inmates per head. If entirely, or in what proportion, it is defrayed from the funds of the institution, or in what other way.

57. Is any, and what, money allowance made to the inmates, and any, and what, gratuity given to them on leaving the institution?

58. State what has been the total yearly cost during the last five years?

59. Answer as in previous questions with regard to

Sickness (No. 29.)

Education (No. 32.)

Religious Teaching (No. 33.)
 Recreation (No. 34.)
 Temperance (No. 35.)

60. What has been the average sum spent, under each of these heads, during each of the last five years?

61. By whom, and under what control, are the funds managed?

62. Have you any other information to offer on this subject, or in regard specially to your establishment?

Signed by { _____ Owner.
 _____ Manager.
 _____ { Public Officer
 of the
 _____ Establishment.

We certify that we are well informed of the management of the above establishment, and that we believe the foregoing statements to be true.

N.B.—The above certificate must be signed by at least two of the magistrates, or one magistrate and clergyman, or other well-known person residing in the locality.

NEW MUSEUMS IN FRANCE.

Rich as Paris and some other parts of France are in museums and public galleries, the list of these establishments will shortly be increased by three special museums of antiquities. After some delay, arising out of the requirements of the law respecting property belonging to minors, the authorities of the city of Paris have obtained possession of the Hôtel Carnavalet, in which is to be established a museum of civic antiquities and curiosities. It is situated at the east end of the town, in the Rue Culture Sainte Catherine, near the Place Royale, and, like the building in which is contained the famous museum of the Hôtel Cluny, has of itself a special antiquarian interest. It was erected soon after the year 1514, when Jacques de Ligneris, Lord of Crosnes, and President of the Parliament of Paris, purchased of the monks of the Val des Eccliers five fields, in which to build a mansion. Pierre Lescot, Abbot of Clagny, furnished the plans for the building, which was erected by Jean Bullant. The work must have been pushed on with rapidity, for in the year 1547 the famous sculptor, Jean Goujon, was engaged on the decoration of the great door. Over the door, on the outside, was the coat of arms of the proprietor of the mansion, supported by two children; arms and trophies enriched the pediment, and over the key stone of the arch was one of those genii, or winged figures, in which Jean Goujon has never perhaps been equalled, certainly never surpassed, by any sculptor of modern times. In the vestibule is a figure of Fame, with two other winged figures above, bearing triumphal palm branches; and here were also two bas-reliefs of lions supporting the arms of the Ligneris family, all the work of Jean Goujon. The Fame and attendant figures still remain in their original position, but the lions were afterwards transferred by Mansard to the outside of the building, where they still are to be seen on the right and left of the pediment. Goujon also executed a colossal group, representing the four seasons, in the court-yard of the mansion. The ornamental sculptures were the work of Ponce Trébat, a Florentine sculptor. The Lord of Crosnes died in 1556, and the Hôtel Carnavalet remained only thirty years in possession of his family when it became the property of

Françoise de la Baume, dame de Carnavalet, by whose name it has since been known. It remained in the lady's family about a century, when it was purchased by M. d'Agaurry, a rich magistrate of Dauphiny, who caused it to be restored and enlarged by the architect, Androuet du Cerceau; lastly, the edifice was again restored in 1634 by Mansard, the architect of Louis XIV.

For twenty years the Hôtel Carnavalet was the residence of Madame de Sevigny, and was the resort of all the wits of the period. At last it became the property of M. Verdot, who there established the institution bearing his name. It is now the property of the city of Paris, and its fine apartments will doubtless soon contain an interesting collection of civic antiquities and souvenirs. Several collections have been purchased, and presented for the future museum, and objects of interest are being constantly acquired. Amongst these is a picture representing the Hôtel de Ville and the surrounding buildings as they stood at the beginning of the sixteenth century, presented to the city by M. Vandermarcq, and a number of original designs of public works executed in Paris in past times. The Hôtel Carnavalet cost the city of Paris 900,000 francs (£36,000).

The city authorities have also just created a special bureau in connection with architecture, the fine arts, and public fêtes, with a view, apparently, of giving to the management of such matters more attention and administrative unity. M. Michaux, chef de bureau in the private office of the Prefect of the Seine, is appointed to this service.

The formation of a general museum of French antiquities in the old château of Saint Germain, which is being restored in the style of the original building, has already been mentioned in the *Journal*, and the work is expected to be completed in two or three years.

The establishment of a third new museum is only just announced. M. Viollet le Duc is engaged in restoring the curious old château of Pierrefonds, near Compiègne, by order of the Emperor, and it is said that another museum of antiquities will be established within what remains of that old feudal edifice which figures so often in the past history of France. When all these plans are completed, France will possess in its capital, and at two points at a considerable distance from Paris and from each other, three establishments for the preservation of the material records of her past history and art so long neglected, and now so studiously preserved.

The museum of Saint Germain will, probably, be confined to illustrations of the Gallo-Roman period, in which case, doubtless, the new museum of Pierrefonds will be devoted to more recent Gallic antiquities.

Fine Arts.

M. HERBERT—the painter of several beautiful and well-known works, amongst which are "Malaria," "The Woman at the Well," and other charming studies of Eastern and Italian life, and many exquisite portraits, real and imaginary—has been appointed to succeed M. Robert-Fleury as Director of the French School in Rome.

ART AND ART-EDUCATION IN PARIS.—The Municipal Council of Paris announces that, in order to prevent Parisian manufacturers from losing their well-earned reputation for works of elegance, the teaching of drawing is extended to 122 commercial schools, male and female, and to 32 adult schools. A sum equal to £33,466 is devoted to architectural works and the fine arts, of which amount nearly half is for decorative purposes.

ROSEN EXHIBITION.—This exhibition, as before stated in the columns of the *Journal*, is one of the most important in France, and becomes more so every year—

the authorities of the town and the local society of the Friends of Art vying with each other in encouraging artists to exhibit in the old capital of Normandy, a country which has produced a large number of painters, and has furnished subjects for pictures innumerable. The exhibition which has recently closed was the largest yet opened by the society, and the sales have also exceeded those of any former year. The great gold medal, of the value of £40, was awarded to M. Charles Landelle, a painter whose style resembles somewhat that of M. Hébert, for a replica of a beautiful work, the "Fellah Woman," which was one of the attractions of the Paris salons last year, and which was purchased for the Emperor's private collection. There were six other gold medals given, the donors being—the Emperor, the Department of the Seine Inférieure, the town of Rouen, the Society of the Friends of Art, the Imperial Academy, and the Society of Emulation—all of Rouen; the Society of Horticulture gave a silver-gilt medal. The names of the other medallists will show that many eminent artists send their works to Rouen; they are, MM. Layerges, De la Rochenoire, Ribot, Achille Zo, T. A. Weber, Tabar; Mlle. Morin (daughter of the Curator of the Museum of Rouen); MM. Cugnot, sculptor; L. C. Duchesne; and Madame Puyroche Wagner. The total amount of sales was about £1,600. The authorities of the town purchased for the Museum a fine picture of Stamboul, by Ziem; a beautiful landscape, by Daubigny; and three other works. The Society of the Friends of Art acquired forty-two works, amongst which were pictures by Weber, Zo, and other well-known artists, and a bronze figure of "Scapin," by Doublemard. Twenty-eight works were purchased by private persons, not members of the society. Such is the result of a few years' perseverance, and of the continued action of the authorities and of the friends of art. The provincial exhibitions of France now form a source of steady income for artists, and especially for those who are still struggling on, or gradually rising to eminence.

NATIONAL PORTRAIT GALLERY.—The small rooms in Great George-street, Westminster, in which are still stowed away 225 portraits, were filled to overflowing by holiday-keepers during the Christmas week. On "boxing day" 860 people passed through the gallery. Their view of the pictures was of course hurried, but their conduct was orderly. At Christmas times a printed list of the portraits, including dates and the names of the painters, is presented gratuitously at the door. This synopsis of the larger catalogue is supplied, at the expense of the Government, from Her Majesty's Stationery Office. The most recent additions to the gallery are portraits of George III. and Queen Charlotte, by Allan Ramsay; Lord Lovat, by Hogarth; and a bust of Richard Cobden, by Woolner. The last is not among the purchases, but a donation. A replica of the bust has been sent to Paris. "Lord Lovat beheaded on Tower-hill" is the well-known engraved portrait. The execution is rude, but the character has been seized with the point and force peculiar to Hogarth. With the fresh acquisitions constantly made, the rooms in Great George-street become each year more inadequate to the display of the collection. Since the decision of the House of Commons last session to retain the pictures of the old masters in Trafalgar-square, the idea has naturally been revived of uniting under one roof the National Gallery and the National Portrait Gallery. Should this plan be adopted, changes in management and arrangement will be involved. It has sometimes been objected to such a measure that the object and character of the two galleries are dissimilar, that a portrait gallery does not regard merit in art, but solely authenticity in likeness. Yet whatever be the final decision, all agree that the existing and still growing collection now housed at Westminster must obtain more spacious quarters. The Gallery is only in its infancy. At South Kensington there will probably have been exhibited, in the course of

the last, the present, and the coming year, not less than 3,000 portraits illustrative of English History. The collection now at Westminster does not reach 300. Persons most interested in the National Portrait Gallery hold the opinion that, could it obtain adequate space for expansion, its growth would become rapid.

BRITISH ARCHITECTURE AT THE PARIS EXHIBITION.—A preliminary exhibition has been held at Kensington, in the first room in the gallery recently occupied by historic portraits, of about 200 architectural designs. From this collection are selected from 40 to 50 drawings, which it is supposed may best represent, in Paris, the progress made by architecture in this country. Prominently among the designs so selected may be enumerated the following:—The Manchester Assize Courts, by Alfred Waterhouse; restorations of the London Guildhall, by Horace Jones, and of St. Stephen's Crypt, by Edward Barry; St. Giles's Schools, also by Edward Barry; Houses of Parliament, Sydney, by Mr. Lynn. Of Albert Memorials will be sent to Paris the non-accepted designs of Charles Barry, of James Fergusson, and of Professor Donaldson; while the design by Gilbert Scott, now in course of erection, will not be sent. Of Captain Fowke's design for completing the International Exhibition building of 1862; of the drawings for the new Museum of Science and Art, now in course of erection at South Kensington; and of the various designs for the projected Museum of Natural History at South Kensington, it does not appear that any record will be made in Paris. It does not seem that Captain Fowke or Godfrey Sykes will be represented. Still further, there are no designs by Mr. Gilbert Scott, Mr. Street, Mr. Hardwick, Mr. Burges, Mr. Butterfield, and some half-dozen other best-known architects. It has been stated, however, that certain additional drawings will be obtained, in order the more fully to represent the modern school of English architecture in the approaching Paris Exhibition.

Manufactures.

SUGAR FOR BREWERS.—The great scarcity of both English and foreign barley fit for malting purposes, has compelled some of the brewers to purchase low sugars for brewing purposes. That really fine barley will be a scarce commodity for several months, is evident from the damp condition in which the bulk of the crop has been secured. The result of an inferior crop of barley is, that the best parcels are worth 54s. and even 56s., and the best pale malt, so much required by the pale ale brewers, 80s. per quarter. With the exception of about 20,000 quarters of fine barley imported year by year from the Danish Islands, the whole of our vast supplies, from the Continent and elsewhere, are composed of qualities only fit for grinding and distilling purposes. Continental countries do not produce a quality of barley which can be converted into good saleable malt.

MINERAL WATERS.—The manufacture of mineral waters in Paris dates back about twenty years. The industry consists in the introduction into ordinary water of carbonic acid gas, formed by a mixture of sulphuric acid and chalk. The digestive action of aerated water, under the name of seltzer water, has brought it largely into use, and the consumer now finds it at hand in all cafés, restaurants, and wine-merchants. It is sold in syphons, in glass, or in stone bottles. An addition of sugar, lemon, or other flavouring substance, produces the ordinary limonade gazeuse, orangeade, and other analogous drinks, of which there is a large consumption in the cafés. There is also a great sale of effervescing powders, consisting of proportions of bicarbonate of soda and tartaric acid, in small packets, permitting the consumer to make his own gaseous beverages. This has given rise to the invention of different apparatus suited to the preparation of these beverages. In Paris there are six steam engines, of 47-horse power

in the aggregate, and 372 workmen employed in this manufacture. The extent of the wholesale trade carried on is about £80,000 per annum. New improvements are continually made in the apparatus and appliances used for preparing and bottling these waters. The sale of lemonade is one of the most prosperous in Paris. The number of *cafés* increases daily, and the restaurants, the singing saloons, and other places of public resort, for which Paris is noted, largely increases the consumption. In 1860 there were 2,200 vendors of lemonade and ices in Paris, employing 4,100 persons, and the annual sales reached £2,500,000.

THE IRON TRADE.—According to the ironmasters' returns, just made, the quantity of pig-iron produced in 1866 in Scotland was 994,000 tons, showing the striking decrease of 170,000 tons as compared with last year. The deliveries per railways, the shipments foreign and coastwise, combined with the local consumption, were 1,136,000 tons, and show a falling off, when compared with the preceding year, of 136,000 tons. As certified by the committee appointed by the trade, the stock of pig-iron is now 510,000 tons, thus exhibiting the marked decrease of 142,000 tons as contrasted with 1865. During the year the price has fluctuated from 82s.—the highest point reached in April—to 51s., the lowest to which it fell, in May, averaging 60s. 6d. per ton, against 54s. 9d. per ton last year. The malleable iron-works, the foundries, the ship-building yards, have felt the languor of the depressing influences which generally prevail. Taking into consideration the steady annual accumulation of the wealth and resources of the British Empire, there is reason to hope for a considerable improvement in the iron trade in the present year.

CORAL FISHERY ON THE COAST OF THE ISLAND OF SARDINIA.—Coral is obtained in large quantities in the Mediterranean. The French have from time immemorial carried on the fishery for this precious zoophyte off the Algerian coasts. Coral is also an important branch of industry and commerce in Italy. That which is obtained from the Sardinian coasts is chiefly found in the shallow waters near Carloforte; Alghero, a province situated on the west coast of the island; and the island of Maddalena. At Alghero, where the growth of coral is the most plentiful, it may be estimated that 190 vessels, of which 150 are Neapolitan, 20 Tuscan, and 20 Sardinian—manned by 1,990 sailors—are employed in this fishery, which begins in the month of March and ends during the month of October. The rose coral, which is the most prized, is sold at very high prices, as it is entirely a fancy article. £80 was paid a short time ago for a piece of uncommon beauty weighing nine ounces. The ordinary price is about £24 per kilogramme. The price of red coral is about £6 per kilogramme. The white coral, the quality of which is often deteriorated by being worm-eaten, is sold at about £2 8s. per kilogramme, and the *ferraglio* at 5s. per kilogramme. The greater part of the coral is brought to Torre del Greco, near Naples. The Sardinians and Tuscans send the produce of their fishery principally to Genoa and Leghorn. The value of the coral obtained each year amounts to £60,000. From this must be deducted £45,800 to defray the expenses of the fishery, so that there remains a net profit of £13,000.

MANUFACTURE OF WINES CALLED "VINS DE PAILLE" IN FRANCE.—The manufacture of these wines is almost unknown beyond those districts in Alsace where it is carried on. All grapes are not suitable for the manufacture of "vins de paille," and it is necessary that the vines should be grown in soils that are suitable for the cultivation of wheat, and for this reason the manufacture of this wine is carried on only in certain districts. At the time of the vintage, the grapes are gathered and loaded with care, and carried to the press-room, where they are spread upon straw, but frequently they are hung upon sticks or cords, with which every corner of the building is furnished, and these grapes may even be found hanging in lofts and passages of the

building. This last place is more advantageous, as the grapes are more easily examined than when spread upon straw; with a little care they may be kept until the proper time for being picked, almost entirely free from rotten ones. The manufacture takes place towards the end of the month of February, and the bunches of grapes are again examined before picking; those that are simply rotten are kept, whilst the mouldy ones are thrown away. They are then trodden in small quantities in small tubs, as the grape being in a state of semi-dedication it cannot be completely crushed, the centre of the mass resisting like an elastic body. The pressed grapes are then heaped up in a cask, and four and twenty hours afterwards the fermentation will have sufficiently softened the mass to permit its being passed through the press. For the manufacture of this wine it will be seen that almost a princely fortune is necessary. A cask of "vins de paille" requires for its production a quantity of grapes which, previous to their dedication, would have produced ten casks. This wine, destined for royal tables or for the episcopal tables of Germany, does not attain its maximum quality until it has been kept at least a dozen years, and after fifteen years its quality is still better. It is curious that, after all this time, it is neither oiled, racked off, nor fined. Racking would be difficult, and the loss excessive, if it was applied to a syrupy liquid like molten gold. As to the oiling it is not necessary, as this wine contains so much sugar that the air has no effect upon it. The skins of the grapes are sometimes distilled. It will be understood that, as these wines contain so large a proportion of sugar, they are of great use for improving the quality of weak white wines. Such wines are poured upon the skins of grapes that have served for the preparation of the "vins de paille" and carefully mixed. As soon as the fermentation begins these are taken away, and the fermentation is completed in casks.

Commerce.

SHIPPING IN RUSSIAN PORTS.—In the port of Riga, from the 1st June to 1st September, 1,011 vessels arrived and 969 sailed. In the sea of Azof, from the opening of the navigation to the 3rd September, 2,881 vessels passed through the Straits of Kertch; the previous year, in the same space of time, the number of vessels that arrived and sailed was about 5,000. There was last year a great movement of shipping in the port of Cronstadt. During the season that it has been open to navigation 2,702 vessels entered, of which 437 were steam vessels and 2,265 sailing vessels. These vessels are divided in the following manner, according to their nationality:—1,164 English, 365 Dutch, 217 Danish, 136 Prussian, 132 Hanoverian, 119 Swedish, 111 Norwegian, 99 Russian, 90 French, 79 Schleswig-Holsteiners, 77 from Lubeck, 59 from Oldenburg, 24 from Mecklenburg, 24 Italians, 12 Americans, 6 Belgians, 4 Austrians, and 3 from Hamburg.

AMERICAN GOLD.—Since the 1st of January, 1866, the receipts of gold at New York from California have amounted to about seven millions sterling. This sum is considerably under the exports in the same period, about £11,000,000. This is the largest amount shipped since 1859, when over 12 millions sterling were forwarded, chiefly to England. On a comparison of years it appears that the annual loss of bullion to the States, that is the difference between the direct imports and exports, is about ten millions sterling. So large an outflow would seem to indicate impoverishment, but it must be recollected that the annual value of the gold and silver raised in America is about 21 millions sterling, the whole of which is immediately passed into active use. So long as the mines of California, &c., continue to yield largely, so long will capital continue abundant in the United States.

COAL EXPORTS.—Messrs. Higginson's circular gives a statement of the export coal trade of the port of Liverpool during the past eleven years, showing the increase of the coal trade at Birkenhead by rail, during the same period, and the quantity exported from there, separate from that shipped on the Liverpool side of the river. There were exceptional causes at work during the year 1865, to cause the exports from the Mersey to fall off as compared with 1864, a large quantity of tonnage usually loading at this port being locked up in eastern ports for want of cargoes to bring them home. This has therefore taken much of the business that would have been done at Birkenhead to the east coast and Severn ports. There was also a great falling off in the quantity of South Wales coal exported from Birkenhead in 1865 as compared with 1864; the decrease being somewhere about 30,000 tons, the requirements for blockade running steamers at Nassau, Bermuda, and elsewhere, having ceased early in 1865.

Year.	Tons of Coal brought to Birkenhead by Rail.	Tons of Coal Exported from Birkenhead.	Tons of Coal Exported from Mersey, exclusive of Birkenhead.	Total Foreign Exports from the Port. Tons.
1855..	178,368	406,561
1856..	211,815	415,036
1857..	276,352	499,173
1858..	253,061	467,478
1859..	309,683	564,947
1860..	236,667	144,000	450,040	594,040
1861..	291,015	190,000	434,549	624,549
1862..	356,802	230,000	379,748	609,748
1863..	428,478	248,956	337,777	586,733
1864..	525,665	313,398	433,444	746,842
1865..	486,505	227,348	389,628	616,976

It appears that Liverpool ranks as fourth in quantity of the coal-exporting ports of the United Kingdom. The total quantities sent abroad during the past year from the four largest exporting ports respectively are as follows:—

1865.

Newcastle	2,277,532 tons.
Cardiff	1,450,941
Sunderland	1,123,572
Liverpool	616,976

Colonies.

SOUTH AUSTRALIAN FINANCE.—The finances of the Government are satisfactory, but a considerable falling off in customs and land sales is expected in the year now commencing. Regarding the large balance in the hands of the banks, it is proposed to let them remain for the present, as it is thought some inconvenience might arise from their withdrawal, and they are not wanted for present use. Government propose to borrow £100,000 for the improvement of Port Adelaide, £150,000 for the construction of a new water works reservoir, and £20,000 for a loop line from Dry Creek to Port Adelaide. In addition to these, government has undertaken an extension of the railway system northwards by laying down light rails for horse traction. An Act of Parliament has recently been passed authorising the leasing of crown lands for other than pastoral purposes. Much is expected from this act, which is very liberal. It enables one to take blocks of land in any size less than 2,500 acres, at 2s. 6d. per annum rent. No conditions are imposed upon the lessee, who will be entitled to the fee simple of his leasehold after he has made eight annual payments of rent.

THE LABOUR MARKET IN QUEENSLAND.—The Govern-

ment are doing everything in their power to provide means to assist the unemployed in and around Brisbane and Ipswich, by the establishment of relief camps, and by offering free passages to those parts of the colony where labour is easily obtainable; but notwithstanding that many have availed themselves of this, and have been conveyed to the northern parts of the colony, the distress in Brisbane still continued. The government have been compelled to alter the rate of wages to men employed in the relief camp from 15s. per three days to 16s. per six days' work, in consequence of which many of the men have struck, and have held a meeting in the outskirts of the town, when it was decided that a petition should be presented to Parliament, praying that they would either grant the unemployed 5s. a day or a passage to Texas, or some colony where labour was more abundant and better wages obtainable. The petition was presented to the Assembly and caused a long discussion. Those who spoke on the occasion were unanimous in recommending government to offer a rate of wages which would keep the destitute from starving, but not interfere with employers of labour, and to convey the unemployed to those parts of the colony where labour was wanted. In the north of the colony as much as 40s. per week has been paid to inexperienced men during the lambing season, and even at this rate sufficient men were not to be obtained.

NORTH AUSTRALIA.—The prospects of a settlement on the north coast of Australia are more gloomy than ever. Mr. McKinlay and his companions, however, speak very highly of the country in Anson's Bay. There is splendid black soil everywhere, commencing close to the sea coast; there is also a fine vegetation, and kangaroos and birds in abundance. The bay is open, but a large island at the north affords a good shelter, and the mouth of the river is large enough to serve as a harbour, but there is a sand-bank across it which should be cleared by artificial means.

RAILWAYS IN VICTORIA.—The revenue of the railways in Victoria for the half-year ending 30th June last, was £276,646 2s. 3d., and the expenditure £126,135 10s. 6d., leaving an excess of revenue over expenditure of £150,510 11s. 9d. The passenger traffic yielded £109,482, and the goods traffic £148,214. The average cost of each train per mile was 4s. 4d. $\frac{1}{2}$ or 45-60 of the accruing revenue. This expenditure is made up as follows:—

Maintenance to permanent way and works	s. d.
Locomotive charges	0 9-55
Passengers and goods traffic charges	1 8-58
General charges	1 7-67
	0 2-72

On the Williamstown Railway the expenditure was within 7 per cent. of the revenue, the cost per train per mile being 5s. 2-98d. against 4s. 2-05d. on the Murray River line, and 4s. 5-92d. on the Ballarat line.

Notes.

NEW NATIONAL GALLERY.—Foreign ministers, members of the two Houses of Parliament, royal academicians, and the competing architects, will, on presentation of their cards at the entrance door, by the Victoria Tower, in the New Palace at Westminster, be admitted on Monday and Tuesday, the 7th and 8th instant, between 10 and 4, to view the designs for the new National Gallery, in the Royal Gallery; and the public will be admitted on Wednesday, the 9th instant, and the three following days, and also on the four last days of each of the two succeeding weeks.

PUBLIC INSTRUCTION AT MOSCOW.—The following are some statistics on the establishments of public instruction in Moscow in the year 1865. This city, containing 365,000 inhabitants, possesses 167 schools, of which 69 are for boys and 58 for girls, and 40 for children of both

sexes. The number of pupils is 11,366 boys and 4,950 girls, and the schools are conducted by 1,521 professors and 70 female teachers. For university education there is only one establishment, the University. The Academy of Agriculture, and the Conservatoire, which have recently been founded, are not included. General instruction is given in five establishments, containing in all 1,719 pupils; three military colleges, containing 1,426 pupils, and six schools for girls. Besides these there are about a hundred private schools, where elementary and general instruction is given. The 66 elementary schools only contain 4,786 pupils, a very small number as compared with the number of the poorer classes which represent 72 per cent. of the total population. The 106 schools supported by the government, by the town, or by benevolent societies, occasion an annual expenditure of 2,560,000 roubles; of this amount 426,000 roubles is required for the University, and 130,000 roubles for the professional school.

PARIS PARKS.—The works of the new park of the Buttes Chaumont are proceeding rapidly, and the inhabitants of the northern part of the city will soon possess one of the most beautiful pleasure grounds in Europe; and another public place of recreation is about to be commenced on the opposite side of the city. The spot selected for the new park is called Montsouris, and is situated on the left of the little river Bièvre, on the southern extremity of Paris, and commanding an extensive view of the Pantheon, Observatory, and other public buildings on the other side of the Seine, and also of the high lands which bound Paris towards the north-east. The ground is traversed by the conduits which convey the waters of Arcueil to the metropolis, which will facilitate the supply of the artificial lakes and canals of the new park. The site occupies about 40 acres, and the new park will complete the public pleasure grounds of Paris, which will then possess four, the Bois de Boulogne to the west, the Bois de Vincennes to the east, the Parc of the Buttes Chaumont to the north, and that of Montsouris to the south. The piece of ground selected for the new promenade is within the walls of Paris, but at present completely cut off from the city, the only road to it being the military route just within the fortifications; the transformation of this desert spot will therefore include a considerable amount of road work. A new boulevard is to be constructed on one side of the park, and two avenues, each more than 70 ft. wide, planted with trees, will connect the new park with the nearest part of the city. One of these avenues will be more than 800 ft., and the other about 3,000 ft. long. The spot is admirably adapted for the purpose intended, for a waste will thus be converted into an elegant pleasure ground, and the two districts adjoining, heretofore almost cut off from direct communication with each other, will thus be united. The railway now making for the completion of the circular line around Paris passes closely the site of the new park of Montsouris.

SCHOLASTIC REGISTRATION ASSOCIATION.—The first annual general meeting of this Association, open to all schoolmasters and teachers, will be held on Tuesday, 8th January, at three p.m., at the house of the Society of Arts, by permission of the Council. The Honorary Secretary will read a report of the progress of the movement to this date, and will fully explain the constitution and operations of the Association. Several gentlemen of influence will take part in the meeting.

MEETINGS FOR THE ENSUING WEEK.

Mon..... Entomological, 7.
 Asiatic, 3.
 Victoria Inst., 8.
Tues..... Medical and Chirurgical, 8j.
 Civil Engineers, 8. Discussion upon Mr. Preece's paper, "On Intercommunication in Trains in Motion."

Patents.

From Commissioners of Patents' Journal, December 28th.

GRANTS OF PROVISIONAL PROTECTION.

Alkalies—3214—J. Williamson.
 Boots, &c., rendering durable—3137—J. Wadsworth.
 Bottles, securing and labelling—3230—J. McGlashan.
 Chains and chain cables—3041—T. M. Gladstone.
 Detaching hooks—3228—W. Clark.
 Elastic fabrics—3151—L. Turner.
 Fibrous substances, preparing—3157—W. Crighton.
 Fibrous substances, preparing—3218—R. Ackroyd and W. Maud.
 Flutes—3208—R. Carte.
 Gas—3226—A. C. Fraser.
 Locomotive carriages—2561—J. W. Daniell.
 Metal bands, connecting the ends of—3234—H. C. Lucy.
 Metals, treating ores of—3212—P. E. de Wiscoq and L. Krasinski.
 Motive power—3224—W. Clark.
 Paper, printing and cutting into sheets rolls of—3222—J. C. MacDonald and J. Calverley.
 Planos, &c., automatical performance of music on—3169—M. A. F. Menons.
 Pumps and fire-engines—3149—H. Bateman.
 Railways, chair supports for the rails of—3153—A. Davy.
 Rope, carding, &c.—3159—W. E. Newton.
 Saws, &c., reciprocating—3236—W. Robertson and C. J. Waddell.
 Ships, applying auxiliary power to sailing—3210—R. Duncan.
 Spinning and doubling—3155—P. McGregor.
 Steam engines—3143—J. Field.
 Vessels, propelling—3139—E. Hughes.
 Weaving, looms for—3187—J. Nuttall.
 Yarns—3216—P. and R. Sanderson.

INVENTIONS WITH COMPLETE SPECIFICATIONS FILED.

Journal of the Society of Arts.

FRIDAY, JANUARY 11, 1867.

Announcements by the Council.

NOTICE TO MEMBERS.

The Council have decided to set apart the first Wednesday in each month, during the present Session, for the discussion of various questions connected with Arts, Manufactures, and Commerce; these discussions may commence either with or without the reading of a paper.

Any member desiring to introduce a subject for discussion should give notice of it to the Secretary, and, if approved by the Council, it will be announced in the *Journal* for one of these evenings. The member who opens the discussion must not occupy more than half-an-hour, but will have the right of reply. No division is to be taken.

On the evening of Wednesday, the 6th February, Mr. Henry Cole, C.B., will introduce the following subject:—

"On the existing legal regulations in reference to the Cab Fares in the Metropolis, and their effect in rendering the Vehicles inferior to those provided in other European Capitals and the large Municipal Towns of this Country."

A new list of members of the Society has been printed, and any member can have a copy sent to him on application to the Secretary.

The Council have appointed Mr. Astrup Cariss, of Liverpool, Honorary Local Secretary to the Society of Arts in that district, in the room of the Rev. Dr. Hume, resigned.

ORDINARY MEETINGS.

Wednesday Evenings at Eight o'clock:—

JANUARY 16.—"On Mercantile Marine Legislation, as affecting the Number and Efficiency of British Seamen." By Captain TOYNBEE, F.R.A.S.

JANUARY 23.—"On the Iron Permanent Way used on German Railways." By T. A. ROCHUSSEN, Esq.

JANUARY 30.—"On Artificial Illumination." By D. N. DEFRIES, Esq.

CANTOR LECTURES.

The following is the syllabus of the course of Six Lectures "On Pottery and Porcelain," illustrated by specimens of various manufactures, and by photographs and diagrams, to be delivered by William Chaffers, Esq.:—

LECTURE I.—MONDAY, JANUARY 21.

ANCIENT POTTERY.—Introduction. Assyria and Chaldaea, Egypt, Greece, Etruria, Rome, &c.

LECTURE II.—MONDAY, JANUARY 28.

MAIOLICA.—Italy, Spain, Persia, &c.

LECTURE III.—MONDAY, FEBRUARY 4.

FAYENCE.—France, Spain, Portugal, Russia, Sweden, Denmark, &c.

GLASS OR STONE WARE of Germany and Flanders, Delft Ware, &c.

LECTURE IV.—MONDAY, FEBRUARY 11.

ORIENTAL PORCELAIN.—China, Japan.

LECTURE V.—MONDAY, FEBRUARY 18.

EUROPEAN PORCELAIN.—Italy, Germany, France, Holland, Belgium, Russia, Poland, &c.

LECTURE VI.—MONDAY, FEBRUARY 25.

ENGLISH POTTERY AND PORCELAIN.—Early History, continued to the beginning of the 19th century.

The lectures will commence each evening at eight o'clock, and are open to members, each of whom has the privilege of introducing one friend to each lecture.

SUBSCRIPTIONS.

The Christmas subscriptions are due, and should be forwarded by cheque or Post-office order, crossed "Coutts and Co.," and made payable to Mr. Samuel Thomas Davenport, Financial Officer.

Proceedings of the Society.

FOOD COMMITTEE.

The sub-committee met on Friday, the 4th inst., and again on Wednesday, the 9th inst.

The following correspondence has taken place on the subject of Mr. Chester's observations on the various kinds of *Extractum carnis* in his opening address, published last week:—

Plough-court, Lombard-street, E.C., Jan. 4, 1867.

SIR,—In your important address to the Committee of the Society of Arts for inquiring and reporting respecting the food of the people, we notice an allusion to Liebig's extract of meat, which, we fear, is liable to lead to an erroneous inference respecting the position of manufacturers of the article, and the relative merit of their products. You are reported to have said that you "believed there was not much doubt as to which of the three (advertised) was the genuine article." It is the fact that a joint stock company was formed about a year ago to manufacture the extract in South America, and that they are now strenuously endeavouring to create a monopoly in the trade; and we regret to add that in this they are supported by Baron Liebig, who has become pecuniarily interested in the undertaking. But it is also the fact that Baron Liebig published the process for making the extract, upon his discovery of it, in the "Annalen der Chemie und Pharmacie" for 1847. Also in "Liebig and Kopp's Report for 1847-8;" in his "Chemistry of Food," 1847; in his "Familiar Letters on Chemistry," and probably elsewhere. It was also published, many years since, in the Bavarian Pharmacopoeia; in Cooley's "Encyclopedia of Receipts;" in Beasley's "Pocket Formulary," &c. Hence there really appears to be no ground for the product of one manufacturer being called genuine in preference to that of another, though doubtless quality will vary, according to the skill and good faith with which the process is carried

out. As the commercial representatives of a gentleman who, by great energy and the expenditure of a large amount of money, has been the first to manufacture Liebig's extract of meat as an article of commerce in Australia, we feel it due to him and to all others interested in this important article to trouble you with these explanations. Trusting that this may be a sufficient apology,—We remain, &c., ALLEN and HANBURYs.
To Harry Chester, Esq., Rutland-gate.

63, Rutland-gate, S.W., 5th January, 1867.
GENTLEMEN,—I have the honour to acknowledge the receipt of your letter of the 4th inst. It is possible that the expressions which I used may lead to an erroneous inference respecting the position of manufacturers of the *Extractum carnis*, but scarcely, I think, respecting the relative merit of their products. I intended to imply that, while only one of the three was an article guaranteed by Professor Liebig himself, the Committee, in the interest of the public, would do well to subject all three to the same analysis, and to give publicity to the result, in order that it might be known which was really the best. Nothing could be further from my wishes, in connection with the important subject of the food of the people, than to promote a monopoly of any kind.—I have, &c., HARRY CHESTER.

To Messrs. Allen and Hanbury, Plough-court.

The Monte Videan Consul-General has made an application for a few numbers of the Society's *Journal* to be placed at his disposal for transmission to South America each mail during the discussion on the food question, "in which," he says, "the Republic of Uruguay is so greatly interested." He adds that "it is intended to offer a liberal prize, during the Paris Exhibition, for a process the best adapted for the utilisation of La Plata beef for European markets." This request has received a favourable reply.

THE BRITISH COLONIES AT THE PARIS EXHIBITION.

By P. L. SIMMONDS.

It is satisfactory to know that the Colonial Possessions of the British Empire are likely to be well represented at the approaching great International Exhibition in Paris. The French are determined to make the most of the products and manufactures of their colonies, and the plan of the arrangements to be carried out at Paris under the two chiefs in this special department is excellent. M. Aubry-Lecomte, the intelligent curator of the Colonial Department, made an excellent display even in his limited space in the French Court in London, in 1862. Where the valuable collection of colonial products, so admirably labelled and described, which were handed over to South Kensington by the French Government, now is I cannot say. I believe, however, it has been sent to the branch Museum at Edinburgh. Seldom has such an opportunity of supplementing the food and trade collections of South Kensington been afforded as that furnished by this vast collection. As a well-informed traveller, personally acquainted with the colonies—a good botanist, and a man eminent for his scientific writings—the acquisition of a large collection which had passed through M. Aubry-Lecomte's hands was an event of importance. The valuable jury and other official reports on the Exhibition of 1862 which he prepared for his Government, and the distinctions he has received, are proofs of his extended knowledge and ability. The Algerian collection of M. Neston, though to some extent more restricted in its character, was also most characteristic and interesting. The two special French

manent colonial collections of Algeria and the Colonies having been temporarily removed from the Palais de l'Industrie, in order that that building may be utilised for the great *fetes* of the forthcoming Exhibition, the curators have the more leisure to develop the indigenous products and manufactures of the colonies with which they are charged. While, therefore, the French on their own more extended ground are desirous of making a magnificent display of the resources of their few colonies, it is pleasing to find that full opportunity is at the same time given to the British colonies to stand prominently forth before the European world and visitors at large.

It is generally admitted that one of the finest displays ever made by our Colonies was that in 1862; and as an equal amount of space is afforded them collectively at Paris, there is every reason to believe that they all intend to do their best.

According to the official allotments, the following are the proportions of space assigned for each group:—

NORTH AMERICAN COLONIES.

	Feet.
Canada	2,000
Nova Scotia	600
New Brunswick	600
Prince Edward Island.....	250
Newfoundland	200
Bermuda	100
Vancouver Island	200
British Columbia	100
	4,050

WEST INDIAN.

	Feet.
Jamaica	450
British Guiana	350
Trinidad	150
British Honduras	100
Bahamas	150
Dominica	50
St. Vincent	50
Barbados	10

1,310

AUSTRALIAN.

	Feet.
Victoria	1,500
New South Wales.....	1,000
South Australia.....	650
Tasmania	650
Queensland	450
New Zealand.....	300

4,550

EAST INDIAN, ETC.

	Feet.
Ceylon	300
Mauritius	150
Malta	150

AFRICAN.

Natal	200
Cape Colony	100
St. Helena	50

950

We are likely to have twice as many colonies represented at Paris in 1867 as in 1855. From the foregoing figures, it will be seen that Canada and Victoria will fill the largest spaces. Having had much previous experience in colonial arrangements, and being also in the receipt of official advices from most of the governors, I am enabled to make some few remarks as to the probable displays of each group of colonies; and certainly in the aggregate they will have lost none of their importance and attractiveness since 1862.

Firstly, then, as to the North American group.—Canada has always made a fine display at the International Exhibitions, and with a large portion of

population of French extraction, there is naturally a desire to place her products and manufactures prominently forward in France. In 1855 Canada received one grand medal of honour, one medal of honour, 13 first-class and 30 second-class medals, besides 43 honourable mentions. The display of the products of mines, forests, and agriculture on that occasion was truly magnificent. Upwards of £16,000 was spent on it. In London in 1862, although a very fine display was made, the commission were stinted for funds.

Nova Scotia, which has taken a prominent and creditable part in the two last International Exhibitions, will put in a good appearance at Paris, under the able superintendence of Dr. Honeyman, F.G.S., who has done so much for her geology and credit in former Exhibitions. Of New Brunswick and Prince Edward Island we hear little at present, although they both sent good collections to London in 1862. Newfoundland will doubtless do something, now that the colony is brought so prominently into notice by the Atlantic Cable. It has little, however, to show except the products of its abundant fisheries, some few minerals, and furs. Bermuda may make a small and neat display. The great distance of our north western possessions on the Pacific, is likely to prevent exhibits from Vancouver and British Columbia reaching Paris in time. Of the West Indian group, British Guiana, Trinidad, and the Bahamas, are the only colonies from which collections may be expected. The recent political excitement in Jamaica has quite interrupted attention to science. Honduras and the smaller West Indian islands may send a few things, as in 1862.

With the exception of Western Australia, the whole of the Australasian colonies will be well represented. Their financial condition and industrial resources enable them to stand forth prominently on this occasion. The only fear is that Victoria will, as in 1862, be behindhand at the opening day, and whilst not being ready herself, will also have been the means of keeping back many of the other colonies whose goods should be near at hand, to be ready for installation in February or March. With the disposition to centralize and attract notice to herself, Victoria has just been holding an Intercolonial Exhibition, to which most of the adjoining colonies were induced to send their exhibits in the first instance before transmitting them to Paris. This local exhibition was only opened in Melbourne on the 24th October, and it is not likely that the goods can be repacked and shipped from Port Phillip before the end of December, so that unless quick passages are made, the vessels cannot arrive in London before the end of March, affording no time whatever for unpacking and arranging goods for the opening on the 1st April. Some of the products intended to be shown by Victoria were noticed recently in the *Journal*.

South Australia proposes to send to Paris a fine collection of its splendid wheat and flour, soap, raisins, pickles, and preserves; kangaroo, calf, and other tanned skins, a large quantity of wine, in bottles and casks; about 100 fleeces of wool, a fine collection of minerals in blocks, cases and cabinet specimens, a slab of marble, 5 feet by 3, a case with 80 facsimiles of Australian fruits, a fine collection of natural history specimens, comprising 200 birds, 12 animals, several fish, reptiles, &c., a collection of woods, photographs, bundles of native spears, implements, waddys, &c., and 18 or 20 live animals and birds. The commissioners appointed are the Hon. G. M. Waterhouse, the Hon. H. Ayers, and Mr. Anthony Foster.

Those who remember the fine and varied collections shown by Tasmania, New South Wales, and Queensland in 1862, will feel assured that in wool, woods, fibres, and minerals they will be equally well represented; also in manufactures and industries, which have lately risen to some importance.

The Colonial Secretary of New Zealand advises me officially that by an arrangement made some time since, the several Superintendents of the nine provinces

of the colony were appointed Commissioners, for the purpose of securing the proper representation of the products, &c., of each particular province at the Paris Exhibition. Bearing in mind the excellent display of products made last year at the Otago Exhibition, Dunedin, a very creditable and interesting general collection may be expected from New Zealand.

Of the East Indian and African groups of colonies I have no special advices. Dr. Forbes Watson, I know, is actively engaged in making a noble display of the various products and industries of India; and not the least interesting feature will be the great work which he has recently brought out, on the "Textile Manufactures and Costumes of the People of India." It is to be hoped that the approaching transfer of the India Museum to South Kensington will not lead to the entire withdrawal from public view of the raw materials and trade products, which are there considered subordinate to the more attractive mediæval and fine art objects.

Mauritius always holds its ground in its special products, under the able management of its Commissioner, Mr. J. Morris; and its native manufactures are sure to be well represented in Paris.

Natal will send a fine collection, as she did to London and Dublin; but the Cape Colony has little to exhibit beyond its wool and wines.

POPULAR EDUCATION IN GERMANY AND SWITZERLAND.

In a letter to the *Manchester Examiner and Times*, Mr. Joseph Kay, who is so well known as an authority on the above subject, says:—

You permitted me to tell your readers how the towns of Prussia, Hanover, Saxony, Baden, Wurtemberg, Bavaria, and the cantons of Switzerland provide themselves with school buildings, playgrounds, teachers, books and apparatus, and how they raise the funds wherewith to pay the school fees for the children of poor parents, and wherewith to supply them with decent clothing for school attendance.

Will you allow me to explain, as simply as I can, the great efforts which these countries are making to obtain good, learned, and efficient teachers for the management of the schools in which the children of nearly all classes of the people commence their education. Of course, in this, as in other parts of their educational systems, the regulations of these different countries vary in some particulars, and in a letter like this I can only attempt to give a general survey of them.

When these countries first began, after 1819, to put in actual effective operation systems of compulsory education, it was felt that it would be worse than useless to provide school buildings and playgrounds, or to send the children there, unless by some means or other good and efficient teachers were obtained for the superintendence, management, and instruction of the children. Several eminent men, and among others, Pestalozzi, Dr. Fallenberg, Vehrli, and Dr. Diesterweg, insisted that a teacher's duties required for their right performance a special training; that an inefficient, ignorant, and immoral man, in such a situation, was a positive evil; that if the teachers really understood the duties of their profession and earnestly performed them, the social condition of the poor would be soon vastly improved; and that it was the duty of the nation, for the sake of its own highest interests, to find all the funds which were necessary for the training of the teachers, for their proper maintenance when appointed, and for their due support when disabled. They argued that by these means fit men would be induced to seek to enter into the profession, and to devote themselves to its important but arduous duties. Several of the eminent men to whom I have alluded established institutions themselves, where for many years they devoted themselves to the education of teachers, in order to show their countrymen what the

teachers of their children ought to be. Of these original institutions I visited two—one conducted on the lake of Constance, by Vehrli; and the other conducted near Berne, by the son of its founder, the celebrated Dr. Fellenbergh.

The example and teaching of these men gradually produced its effect. Training colleges for the teachers were established, first in the Swiss Cantons, then in Prussia, and, at last, over all the countries I have named. And now, for the last forty years in some of these countries, and for the last thirty in others, great sums have been annually expended by the governments in founding, perfecting, and supporting great numbers of these colleges for the education and training of the teachers of the different religious parties. Some of these colleges are set apart for the education of Roman Catholic teachers, and others for the education of the teachers of the Protestant churches.

As soon as means were provided for the education of teachers laws were enacted which prohibited any person from officiating as a teacher, either in a private or a public school, until he had passed an examination and obtained a diploma or certificate of fitness from one of the examining bodies instituted by law. All the teachers in these countries are now educated men who have obtained their diplomas.

Schools like our so-called "dame schools," and schools conducted by poorly-educated mechanics, shoemakers, or tailors, are unknown in these countries. They would not be tolerated. In some of the countries I have mentioned it is thought so important that none but really efficient men should be entrusted with the management of schools that the law forbids the examiners to grant a diploma or certificate to any one who is deaf, blind, lame, deformed, or consumptive. And, in addition to these precautions, the examiners are forbidden to grant a diploma to any candidate who does not present at the examination a certificate of good moral character, signed by the religious minister of the congregation to which the candidate belongs.

Such being the stringent precautions which are taken to shut out unfit persons from the profession, let us see what has been done to induce clever boys and young men to strive to enter it. The inducements are the following:—

1. Nearly all the expenses of the teacher's education are paid by the central or provincial governments.
2. If the young candidates once succeed in getting a diploma, their future career is assured.
3. A house, a moderate and increasing stipend, fuel, and, in the country districts, a small plot of land, of one or two acres in extent, are provided for the teacher.
4. A provision is made for those who become incapacitated by age or sickness.
5. A provision is also made for the widows of deceased teachers.
6. They are exempted from liability to perform military service.

But what is beyond all these advantages, in the estimation of many, is the fact that the profession opens an honourable career to the intelligent and clever children of the poorest parents. It is an outlet for the intellectual activity of the ablest of the poorest classes. It is a ladder by which a clever boy may climb out of the ranks of mere manual labour.

This last consideration, and the universal sense of the good that these excellent men are doing, side by side with the religious minister, make them thoroughly popular and thoroughly trusted among all classes of the people. The teachers are always mentioned with respect and admiration. Owing to these considerations, there are always in all these countries great numbers of candidates for the teacher's profession. These candidates are the sons of mechanics, small shop-keepers, workmen, farmers, and of the teachers themselves.

Let me shortly sketch the training and education

through which those who wish to enter the teacher's profession have to pass.

All children, if not educated at home, are obliged to attend some school until their 16th year. If, at that time, a boy's parents wish him to enter the teacher's profession, and if he shows sufficient ability and industry to give fair promise of success, he remains at the primary school for two or three years longer, and pays the teacher some small extra fee for special instruction; or, if his parents or friends can afford the small extra expense, he enters the classes of one of the superior or secondary schools. Until he attains the age of 18, he pursues his studies in one of these schools. At the age of 18 he takes with him certificates of conduct, and presents himself at one of the annual entrance examinations of one of the teachers' colleges. All the candidates are then examined. The most proficient are selected to supply the annual vacancies. Once admitted into one of these institutions, the expense of his education and board is defrayed for two or three years almost entirely, and in some cases entirely, by the government.

There are several hundreds of these colleges established throughout the provinces of these countries. Many of them are large, roomy, and admirably arranged buildings, surrounded sometimes by a farm and sometimes by large gardens. The education given in these institutions is of the most liberal, but at the same time of the most practical kind. The education comprises:—

1. Religious instruction under the direction of the head of the college.
2. The German language.
3. Geography, history, the rudiments of the physical sciences, botany, and natural history.
4. Farming or gardening.
5. Drawing.
6. Music.
7. Pedagogy, or the art of teaching.

In some of these colleges Latin is also taught. In all of them the young teachers practise singing and also the use of some musical instrument. Nearly all the teachers in Prussia can play either on the organ, pianoforte, or violin. In one of the Prussian colleges I saw four organs, nine pianofortes, and 100 violins, for the use of the students. Singing forms a part of the instruction given in all schools, both in the towns and in the country districts.

In many of these colleges, the young men are taught how to dress the more ordinary kind of wounds, and how to act in the case of the more ordinary kind of accidents, so that they may be able to render aid in the villages, in the absence of a medical man.

In some of the purely agricultural provinces, the young teachers are taught scientific and practical farming, so as to be of use to the farmers in the remote districts in which they will have to labour. In many of the colleges, they are taught how to manage orchards and kitchen gardens, and how to prune trees.

A school for the children of the neighbourhood is generally connected with each of these institutions. In the school the young teachers practise teaching for a certain number of hours every week, under the guidance and surveillance of experienced teachers. I mention all these things only to give your readers some faint idea of the care which is bestowed in these countries to the teachers to be the instructors and the moral guardians of the children, the assistants and friends of the parents, useful neighbours of all, and disseminators of a high civilisation in the remotest districts.

I visited these colleges in the provinces on the Rhine at Berlin, in the south of Prussia, in Saxony, at Carlsruhe, in Bavaria, on the Lake of Constance, and in many of the Swiss Cantons. Everywhere the effort seemed to be to make the teachers as efficient and as useful as possible to the people among whom they would have to labour and to live.

When the period of residence in these colleges is com-

cluded, the young men are examined by boards of examiners. If they pass these examinations satisfactorily they receive their diplomas, and they can then accept a situation as teacher. But if they do not pass they cannot obtain a diploma, and the law forbids, in their case, their acting as teacher, until they have obtained the necessary certificate of competence at another examination.

Every parent has, by these means, the assurance that any one who is officiating as a teacher has obtained a diploma, certifying the sufficiency of his acquirements and the correctness of his moral conduct; while the reputation and status of the teacher is, by these means, raised in the estimation of their neighbours, and their influence for usefulness is thus proportionately increased.

Throughout nearly the whole of Germany and Switzerland, all the children, between the ages of 5 and 15, are under the care of teachers educated in this way. There are 46,227 teachers thus trained, working in the primary and superior schools of Prussia alone. I have seen them at work in their schools in various parts of Prussia, Saxony, Baden, Bavaria, and Switzerland. I have lived among them, and associated with them. They are intelligent, well-informed, and able men. They are thoroughly respected by the people.

I did not wonder, when I saw these men, to find that they were constantly entrusted with the younger children of all classes of society, and thus, even in the primary schools of artistic and luxurious Munich, children of mechanics, shop-keepers, professional men, and nobles, were sitting side by side in the same class-room, and under the same teachers. Instead of crowds of children being left to grow up in the streets, filthy, ragged, and neglected, all the children in the towns of these countries are in clean and well-furnished class-rooms, comfortably clothed, and under the care of these educated men. The health, the habits, and the education of these children are carefully watched over and fostered. Healthy sports and exercises are encouraged. Cleanliness is strictly enforced. The necessary clothes are found for those whose parents are not able to provide them.

No candid and unprejudiced man can have watched the effects of these institutions without being convinced that they are improving the physical and moral condition of the people. For my own part, I am sure that even if no instruction whatever were given in these schools, the mere sanitary advantages which are derived from them, in the improvement of the physical condition of the people, would of itself much more than repay all the expenditure which these systems of national education have entailed.

Far more, however, than this is effected by these schools. The children who are educated in this way grow up to be better citizens, more skilful artisans, more efficient soldiers, than the thousands and tens of thousands of poor creatures who are left to grow up in our streets utterly neglected.

If we English would keep our own in the great race of civilisation and of life, it behoves us to think of these things. For I am not only sure that the Prussian army owes its success partly to the intelligence and moral self-control of its soldiers, but I feel convinced that in all those pursuits and manufactures which depend for their success and for their development upon the skill, the intelligence, and the artistic feeling of the workmen, the Germans will pass us in the great race, unless we do much more than we have yet done for the education of the future generation of our workmen.

If no other proof of the admirable effects of these schools existed, there is one proof, which to my mind is incontrovertible, and that is the high value which the workmen and the peasants of these countries set upon the schools, and the respect and affection with which they always speak of the teachers. The poor themselves thoroughly understand the benefits which they and their children are deriving from the schools. The provinces where all these regulations are the most stringently en-

forced are the democratic cantons of Switzerland, where the people themselves enforce them.

The only discussions which are heard in the parliament are how to perfect all these regulations. No party now dreams of abolishing them. I have myself several times seen poor parents applying to the municipal authorities for permission to send their children before the legal age to school. Many and many a poor parent has told me of the benefits his children were gaining from the schools. I never heard any person in any of these countries speak in a complaining or in a disparaging way of the schools or of the teachers. And yet, spite of the experience of all these countries, it is certain that in this year, 1866, in London alone there are tens of thousands of children, between the ages of five and fifteen, who never receive any training or any education whatsoever.

MINING EDUCATION IN GERMANY.

The hundredth anniversary of the foundation of the well-known Mining College of Freiberg was to have been celebrated last summer, with great festivities. Unluckily, war broke out in Germany, and the celebration of the "Jubiläum" fell to the ground. A work, however, has been published in commemoration of this anniversary*. It contains several interesting articles, most of which are written by professors of the College. The first is a history of the Mining College from its commencement, in 1766. Short biographies are given of the professors and principal persons connected with the College since its foundation. Among these Werner is, of course, the best known, but the names of Gellert, Lampadius, Mohs, von Haidinger, Kersten, Plattner, Naumann, Breithaupt, Weisbach, Scheerer, Reich, and von Cotta, are familiar to the student of metallurgy, mineralogy, mechanics, and geology. In the account of the lectures which follows, it is shown how the plan of instruction was gradually widened until it assumed its present extensive character. The accompanying table shows the proportions the instruction has assumed in the year 1865-66 (see next page).

The students are divided into two classes—those studying at the expense of the State, and those who pay their own expenses. Saxons can have their education free on paying £7 10s. yearly. All other persons pay according to the lectures they attend.

Exhibitions to the amount of £67, besides travelling scholarships to the amount of £75, are awarded every year; they are confined to Saxons studying at the Government expense. There are besides, the Werner, Breithaupt, Bondi, and Fischer exhibitions.

The Mining College costs the State less than £2,000 a year, including the salaries of the professors, apparatus, exhibitions, &c. The library, mineral collections, models, and apparatus, have been valued at nearly £20,000. A useful adjunct to the College is the dépôt of minerals for sale. Students are enabled to buy minerals at a comparatively small cost, and as exchanges are made with the regular mineral dealers, specimens from other localities are obtained for the mineral collection.

The second article is by Prof. Dr. Scheerer, Councillor of Mines, on "Mining Studies." After touching slightly upon the practical effects that the mining school has had upon mining generally, he treats at length the influence which the study of mining, as pursued at Freiberg, has upon a man's moral, social, and political character. The picture of politics, from a miner's point of view, is cleverly drawn:—"A high, dome-shaped mountain slopes down on all sides, and is surrounded by precipitous ravines. Its summit, covered with ice and névé, allows nothing organic to grow up—that is Despotism. The nearer we get to the valley the richer and more luxuriant is the verdant covering of the hillside, until we come to the wild rugged precipice—at the edge of

Prof. von Cotta proves that there is a gradual passage from fine-grained reddish granite to the almost compact black stanniferous zwittler. The zwittler is an altered granite, which has lost about 3 per cent. of silica and 2 per cent. of potash, and has taken up 4 per cent. of ferrous oxide and $\frac{1}{2}$ per cent. of stannic oxide.

Professor Dr. Scheerer contributes a second paper, entitled "On the Chemical Constitution of Plutonic Rocks." He adopts the division of rocks into *sedimentary*, *metamorphic*, *plutonic*, and *volcanic*. In the two latter classes are placed all rocks made up of silicates, which were originally in the melted state, and have since then in part been erupted. Professor Scheerer finds, by comparing a number of analyses, that although these rocks consist of mechanical mixtures of several minerals, they nevertheless have definite chemical compositions, which can be expressed by chemical formulae. He divides the plutonic and volcanic rocks into nine classes, each class having its own chemical formula. The uniformity of composition of rocks found at great distances from one another is accounted for by supposing that the rock in the melted state was a simple definite chemical compound, and that in the act of hardening its constituents arranged themselves so as to form a mixture of two or more minerals. A number of analyses of plutonic rocks are given, and these are shown to agree very closely with the formulæ which Professor Scheerer lays down.

The groups and classes which Professor Scheerer makes are as follows:—

1st GROUP.—PLUTONIC ROCKS.

(Group of the acid and neutral silicates.)

Examples.

1. Upper Plutonic Red gneiss of Saxony.
2. Middle Plutonic Much of the granite of Saxony.
3. Lower Plutonic Grey gneiss of Freiberg.

2ND GROUP.—PLUTO-VOLCANIC ROCKS.

(Group of the two-thirds silicates.)

Examples.

4. Upper Pluto-volcanic Quartziferous syenite.
5. Middle Pluto-volcanic Common syenite.
6. Lower Pluto-volcanic Melaphyre.

3RD GROUP.—VOLCANIC ROCKS.

(Group of the one-third silicates.)

Examples.

7. Upper Volcanic Augite porphyry.
8. Middle Volcanic..... Common basalt.
9. Lower Volcanic Basic basalt.

The author is of opinion that "If the earth in a liquid state had solidified without any local disturbances, and had been subject to no disturbing influences afterwards, the crust of the earth underneath the sedimentary deposits would consist of these nine chemically typical rocks, all of which would probably have their constituents arranged in a more or less parallel manner."

It is found that a simple determination of the percentage of silica in a plutonic rock is sufficient to settle whether it belongs to the upper, middle, or lower class.

An article "On the Instruction in Practical Surveying at the Mining College," by Professor Dr. August Junge, shows that great pains are taken to make this branch of study complete. Each pupil is expected, during the year that he attends Professor Junge's course, to carry out the following exercises:—

The survey of a mine with the ordinary apparatus.

The survey of a mine with the surveyor's goniometer.

The levelling of a mine, &c.

To connect a mine survey to a surface survey through an adit or inclined shaft, or by the plumb line in a vertical shaft.

A triangulation including the measurement of the base line.

this precipice is Republicanism. Between 'the two extremes there is plenty of sunny and fruitful land, which will afford the Christian settler a peaceful home, without exposing him to the danger of falling over the precipice or being frozen to death. He who has chosen the soil of Constitutional Monarchy as his home has still plenty of scope, either upwards or downwards, only let him take care not to approach too closely to either destructive extreme."

Prof. B. von Cotta contributes an article on "A Collection of Rocks and Fossils in the Courtyard of the Mining College." Perhaps the most interesting and instructive part of the paper for the miner is the short account of the Altenberg Zwitter, a rock containing a sufficient quantity of tin to make it pay for working.

A survey with the plane table, based upon the previous triangulation, in connection with the compass and theodolite.

To set out a railway or water-courses.

To measure the cubical contents generally of the *attle*-heap of a mine.

To determine the meridian line astronomically, in connection with the determination of time.

Few persons who have studied at Freiberg would pass over the article by Professor Theodor Richter, "On the Blowpipe, and its Application in Chemical and Mineralogical Investigations, and in Assaying," for scarcely a student leaves the town without carrying away with him a real affection, if I may use the term, for the blowpipe, and a grateful recollection of the kind manner in which the instruction was imparted by Professor Richter. The history of the blowpipe given by Professor Richter, from which the following account is abridged, is more complete than that which appears in the last edition of Plattner's "Probirkunst mit dem Löthrohre," or in Dr. Aquila Smith's "Blowpipe Vade Mecum." The earliest notice of the use of the blowpipe in mineralogy is probably that contained in the treatise of Erasmus Bartholin, on Iceland spar, which was published in 1670. He remarks that Iceland spar burns to lime before the blowpipe: "*Quippe, cum frustulum hujus crystalli, flammæ lampadis per fistulam, qua vitra hermetice occluduntur, animatae, admoverem; mox animadverti redigi in calcem similem calci vivæ, etc.*"

"Sweden," says Richter, "must be looked upon as the cradle of blowpipe assaying. We find in that country, from the middle of the last to the first half of the present century, a series of distinguished men who paid much attention to the blowpipe, and considered it an essential instrument in their chemical and mineralogical investigations; I refer especially to von Cronstedt, von Engeström, Bergmann, Gahn, and Berzelius." Von Cronstedt was the first who made a portable blowpipe apparatus, or so-called pocket laboratory. Bergmann extended von Cronstedt's researches, and published in 1778 the result of his experiments in a treatise, "*Commentatio de tubo ferunatorio, &c.*" Gahn made numerous important improvements, but published nothing. Berzelius, however, has given to the world the results of Gahn's experience, with many additions of his own. The appearance, in 1820, of Berzelius' works, "*Die Anwendung des Löthrohrs in der Chemie und Mineralogie*," forms an era in the history of the blowpipe. The numerous translations of the book enabled foreign chemists and mineralogists to take up the subject. The most important additions to the uses of the blowpipe since the time of Berzelius, have undoubtedly been made by Harkort and Plattner. Harkort, while studying at Freiberg, in 1826, hit upon the idea of employing the blowpipe in quantitative as well as qualitative experiments. He began with the silver assay, and described his process in a pamphlet, published at his own expense, in which he promised that the description of other assays should follow. This promise was never fulfilled, as Harkort took a mining appointment in Mexico, and did not pursue the subject any further. Plattner took up the subject where Harkort left off, and not only completed the silver assay, but also discovered methods of making quantitative assays for gold, copper, lead, bismuth, tin, nickel, and cobalt, by means of the blowpipe. He published his experiments in his "*Probirkunst mit dem Löthrohre*," which went through three editions during his lifetime, and has been translated into several languages. It should be added that a fourth edition was published in 1865, edited by Professor Theodor Richter, formerly assistant to Plattner, and who has now taken his place as professor of blowpipe assaying.

After a short account of the various forms which the blowpipe has taken in the hands of different experimenters, we come to the mechanical means of producing a blast. The use of the blowpipe was thought by some persons to be injurious to the health, and on this account,

and because some persons had a difficulty in keeping up the blast, blowing machines were invented. Berzelius and Plattner set their faces against them, because they did away with the great advantage of the blowpipe—its portability. Of late years an india-rubber blower has been invented, which is light and portable, and may be looked upon as the best substitute for the ordinary blowpipe yet invented. It is especially useful in quantitative assaying, where some effort is required to keep up a steady blast for a long time.

With one part of Professor Richter's article, every Englishman who has studied at Freiberg will fully agree. Professor Richter says: "Looking at the extensive field which has been gradually laid open to the blowpipe, and at the perfection to which it has attained, it must appear strange that even now but a very limited use is made of this instrument in mineralogical researches and in chemical laboratories, although one of the greatest mineralogists* says that in its way it has done as much for the chemistry of minerals as the goniometer for crystallography. The reason of this must be in a certain easy-going carelessness, or in an imperfect knowledge of the experiments which can be performed by the use of the blowpipe, or in the want of that knack which the experiments require, though this need not be anything extraordinary."

"It is true that in books on analytical chemistry mention is usually made of blowpipe experiments, and attention is drawn to their importance in qualitative analysis, but the practical instruction is, alas! often very scanty and insufficient; and when one sees the manner in which the blowpipe is used, as well as the nature of the apparatus employed, one often feels oneself unwillingly carried back to the time of Swab and Cronstedt. When to this is added the fear, which is absolutely groundless, that the blowing is injurious to the health, we need not wonder that most people have a very vague idea of the usefulness of the blowpipe, and consider it unworthy of their special attention."

"And yet these blowpipe experiments are especially fitted, more so than most chemical operations, to create a certain mechanical skill, and to exercise and sharpen the powers of observation. What a small quantity is soon found to be sufficient, both as regards the substance to be tested and the re-agents made use of, and how much quicker in many cases is the end attained!"

"The remark is often made, and is frequently also found in books, that blowpipe experiments are confined to a very limited circle. Those who see or will only see in the blowpipe a mere jeweller's instrument, may be right, but he who tears himself away from such one-sided views, and, following Plattner's example, uses the wet way also, will soon be convinced that blowpipe analysis has its special advantages."

"The benefits which quantitative assays by the blowpipe offer to the practical miner or smelter scarcely need any special remark. The miner, above all, who rarely has at hand the extensive apparatus and the instruments of a chemical or metallurgical laboratory, finds in blowpipe assaying the simplest mode of testing the results of his labour."

"The chief obstacle to a more frequent and general application of the blowpipe to the uses indicated in the title of this article, lies, according to my idea, in the fact that a person can rarely get the opportunity of obtaining thorough instruction in the use of this instrument. Berzelius,† in his history of the blowpipe, remarks that such assistance is indispensable, and that without it a person cannot get a true idea of the value of blowpipe experiments. The experience that I have had makes me agree fully with this opinion, and I conclude by wishing and hoping that this difficulty will be gradually removed."

A considerable part of the "*Festschrift*," is occupied by a list of those who studied at the Mining College, from its opening to the end of the first hundred years.

* Fr. von Kobell, *Geschichte der Mineralogie*, p. 119.

† Berzelius, *Anwendung des Löthrohrs*, etc., p. 5.

The list gives the name, place of birth or residence, and the present or last situation. The most distinguished name on the list is that of von Humboldt, who studied at Freiberg in the year 1791. The first Englishman whose name appears is John Hawkins; he matriculated at Freiberg in 1786; he afterwards became a Fellow of the Royal Society, and was a frequent contributor to the "Transactions of the Royal Geological Society of Cornwall." In the following year we find the name of James Watt, of Birmingham.

In the first hundred years there have been altogether 2,465 students at Freiberg, besides certain occasional students who did not matriculate, and whose names do not in all cases appear. Of these 2,465 students, 2,838 were Europeans, the rest from all parts of the world, a large proportion being from South America. Then again of the whole number 2,007 were Germans, and 458 non-Germans, or 1,225 Saxons, and 1,240 non-Saxons.

Baron von Beust, a brother of the late Saxon minister, and who is at the head of all mining in Saxony, and rejoices in the title of "Oberberghauptmann," closes the volume with an article "On the Condition of Mining and Smelting at Freiberg a hundred years ago and at present."

We learn from Baron von Beust's paper that in the year 1765 there were in the Freiberg district 185 mine-buildings, and 3,062 men employed at the mines. The production for that year was 3,671 * tons of ore, assent to the smelting-house, containing 12,023 lbs. (troy), of silver, 383 tons of lead, and 2 tons of copper, the value of which, according to the present scale of payment for ores, would be about £32,600. Against £1,835 paid in dividends, &c., we have payments of calls to the amount of £3,970. Mining in the year 1765 was not so favourable as it turned out a few years later, when several mines "cut rich," especially Himmelsfürst, Bescheert Glück, and Alte Hoffnung Gottes. The average wages of a miner in 1765 were not more than £8 a-year; but it must be recollected that the miners only worked five eight-hour shifts, or "cores," to use the Cornish expression, in the week. The amount paid by the mines to the *Knappschaftscaze*, or provident fund, was at most only £300 yearly, i.e., 1½ per cent. of the wages, but then the payments to pensioned-off miners, miners' widows and orphans, were very low indeed.

In the year 1865 there were 79 mines at work, with 7,963 miners (including captains and day-labourers). We may add † that in the year 1864 there were only five fatal accidents, although a very large proportion, namely, 3,560 men came into the doctor's hands, either on account of injuries received during their work, or from illness.

The production for the year 1865 was 28,105 tons of ore, containing 69,437 lbs. of silver, 4,344 tons of lead, 73 tons of copper, 179 tons of arsenic. For this the mines received £218,553, besides £755 for sundry products, such as heavy spar, fluor spar, arsenical pyrites, &c. The amount paid in dividends, &c., was £13,267, whilst the calls only amounted to £6,367; the state also paid £1,903 for extraordinary improvements in the Government mine, Churprinz.

The average wages for the year, per man, were £16 10s. It must be recollected, in comparing this with earlier times, that a hundred years ago the miner only worked about 40 hours a week, whereas now he works 66. If a miner, a hundred years ago, had worked 66 hours a week instead of 40, his wages would have amounted to £13 4s.; comparing this with £16 10s., we see that wages have risen 25 per cent.

With respect to the funds of the Provident Society, we find that the owners of mines paid 15 times as much as they did a hundred years ago, although there are only 2½ times as many men, and although the total value of

the produce has only increased 6½ fold. The miners also contributed more largely, and, consequently, the pensions can be made from 2½ to 3 times as much as they were in 1765.

Baron von Beust considers that the price of material and carriage has risen, on the whole, 30 to 40 per cent. during the last hundred years. For though some things, for instance powder, are cheaper, yet wood, which is largely used, has become much dearer. However, the mines are better paid for their ore than formerly, and are better off with regard to the payment of taxes; still, in the opinion of von Beust, this does not make up for the increased expenditure in materials and carriage. Since 1765 the principal mines have been deepened to the extent of 100 to 150 fathoms, and more than 180 miles (English) of levels have been driven.

No exact record exists of the amount of machinery employed in 1765, but in 1767 there were only 18 water-wheels working pumps, and 5 working whims. Von Beust puts the total horse-power of the water-wheels at pumping at 180, and of those for winding at 30.

In 1865 there were at the Freiberg mines:—

	Total horse-power.
29 water-wheels for pumping	429
6 turbines " "	190
14 water-column engines "	416·5
8 steam-engines " "	281
16 water-wheels for winding	155
2 turbines " "	16
18 steam-engines " "	343

This makes a total of 1,316·5 horse-power employed in pumping, and 514 in winding. The amount of machinery used in dressing has also risen very considerably.

In order to lessen the expense of keeping the levels in good order they are walled as much as possible with bricks—to a greater extent, perhaps, than will be met with in any other mines.

Von Beust makes a curious calculation with regard to the Freiberg lodes. He says that in 1765 the value of a square fathom, taken along the lode, may be estimated at £10 7s., whilst in 1865 it was only £6 9s.; putting the average value for the last hundred years of a square fathom taken along the lode at £10 6s.—and for this von Beust gives his reasons—we see that the value of the stuff worked during the year 1865 is very considerably below the average. The reason of this lies only to a small extent in the fact that they can now work ore which formerly were too poor to pay; the chief reason, according to von Beust is, that during the last few years the lodes have become poorer.

We next come to the smelting works, and, beginning with the ores, it is stated that the mines are now paid 12 per cent. higher for the lead and silver contained in the ores than they were a hundred years ago. In those days charcoal and wood formed the chief fuel, now it is coal and coke. The wages in 1765 were very low; a smelter only got from 3s. to 4s. 2½d. a week, whilst now he gets from 8s. 6d. to 10s. 6d. The loss of metal was large, being 4 per cent. of the silver, and 81·5 per cent. of the lead. This enormous loss of lead was caused by the proportion of lead to the silver in the ores smelted being too small, and the lead was worked over and over again. The loss is now 1 per cent. of the silver and 15 per cent. of the lead. The net profit to the Government in the year 1765 was £5,000, now there is a profit of £60,000.

The most important technical improvement in smelting during the last hundred years, was the introduction of the European amalgamation process; some ten years ago it was replaced by other processes. During the last ten years great efforts have been made to neutralise the bad effects of the sulphurous and arsenical smoke given off in treating some of the ores. Although this has been done at considerable expense, it has opened out a new field of usefulness, the profits of which, it is hoped, will compensate for the expense incurred. Among other

* All the weights and measures used in this article have been reduced to English standards.

† Jahrbuch für den Berg-und Hüttenmann, 1866, pp. 60 and 61.

things the following improvements have been introduced:—Rhenish calciners, with a double bed; blast furnaces, with closed breast and water tuyeres; English reverberatory furnaces, lead refineries, and Pattinson's process; flues and chambers for catching the fume.

Among the peculiarities of the Freiberg smelting works we have the extraction of copper from argentiferous copper regulus, by means of sulphuric acid, and the production of blue vitriol, and then again the utilization of the smoke from wasting pyritiferous ores in the manufacture of sulphuric acid.

The production of zinc on a large scale has not yet succeeded, but it is hoped that it will soon become a profitable branch of manufacture.

In the year there were bought 39,108 tons of ore and "sweeps" from home and abroad, containing:—135 lbs. of gold; 80,289 lbs. of silver; 4,446 tons of lead; 139 tons of copper; 1½ ton of nickel and cobalt; 179 tons of arsenic; costing £26,178.

In the year 1865 the smelting works sold 97 lbs. of gold, 84,149 lbs. of silver, 3,608 tons of lead (in part as shot, sheet-lead, pipe, &c.), 856 tons blue vitriol, 18 tons nickel speiss, 12 cwt. bismuth, 12 tons zinc, 2,095 tons sulphuric acid of 66°, 37 tons green vitriol, 93 tons sulphate of soda, and 600 tons arsenical products. The total amount received for the whole was £392,653.

Fine Arts.

THE LOUVRE.—Another fine new room has been opened in the Louvre; a large square apartment, situated in the Pavillon Denon of the new Louvre, and between the two galleries, appropriated to the French school, opened some time since. It is highly decorated; in the centre of the ceiling is a seated female figure, writing on large tablets, painted in what is called *cambréu mordoré*, reddish brown tints, by M. Charles Müller. In the angles are four historical pictures, the subjects of which are:—Louis XIV. ordering the construction of the Louvre; François I. in the atelier of an artist, with a sketch of the famous Chateau de Chambord in the distance; St. Louis, with a view of that architectural gem the St. Chapelle, which was built by his order by the side of the Palais de Justice, where he resided, to receive the relics brought from the Holy Land; and, lastly, Napoleon I. decreeing the completion of the Louvre, which his nephew, the present Emperor, accomplished. Around the ceiling are richly-decorated vaultings. The room is surrounded by an entablature, forming a balcony, and above this are eight female figures, representing the fine arts in their various forms, and painted in false niches. On the walls are the battles of Alexander, by Charles Lebrun. The ancient apartments of Anne of Austria, which contain a portion of the classic sculpture of the museum, have been thoroughly decorated, and will shortly be opened again to the public.

Manufactures.

THE RESULTS OF THE RECENT STRIKES IN THE IRON TRADE.—It is calculated (says the *Colliery Guardian*) that about £300,000 has been lost to the men in wages alone, while the contributions which the union has given to some 3,000 of the 10,000 to 12,000 who have been thrown out by the strike, have not exceeded £10,000, leaving a net loss of £29,000; while by far the greater portion of the men have had no assistance whatever, and have been compelled to endure the greatest privation and suffering. But, in addition to this, by suspension of work for the nineteen weeks of the strike, a sum of about £1,250,000 has been lost to the district, and must have made a great difference to tradesmen of all kinds. There

are also secondary losses which will have to be borne. The malleable iron trade has been directed into other channels, and under the most favourable circumstances a long time must elapse before it will be got back again. This means short time even at the reduced wages, and the non-remunerative employment of capital for the manufacturers, with corresponding effects to all who depend directly or indirectly upon the iron trade. The labour market has also been affected in two ways. A large number of fairly-skilled underhands have risen to a foremost place, and the men imported from other districts are far more numerous than are those who have left the north country.

SUGAR MANUFACTURE IN THE WEST INDIES.—The system of sugar extraction pursued in most tropical countries (says the *Produce Markets Review*) is well known to be defective to the last degree, and, in fact, the operation, far from being so easy as to be completely performed by the rough-and-ready way, is a most difficult science, and requires the combined aid of skilled agriculturists, chemists and machinists, to be properly carried out. The waste caused by the present system is something astounding, and has been briefly summed up by chemical authority on the basis of an average yield from the West Indian canes of 18 per cent., thus:—

One-third is left in the megass	6 per cent.
One-fifth of the remainder in the skimming	2½ "
One-third to one-half of the second remainder in the molasses	3 "
Leaving for actual sugar exported	6½ "
Total	18 "

It will be remembered that the object of the process is to make sugar; and its result, so far as the West Indies is concerned, is that out of 900,000 tons contained in the canes, 325,000 tons only are exported in the shape of sugar. The value of the sugar in the canes at 25s. per cwt., is £22,500,000. The value of the 325,000 tons of sugar extracted at the same price is £8,125,000; the value of the 160,000 tons of molasses is £1,200,000; of the rum extracted from the skimmings (according to the value of the imports into England), £600,000; or, in short, the planter extracts from his canes £9,925,000 worth of produce, instead of the £22,500,000 he might get. But this is not all his loss, for the produce is so imperfectly prepared that 10 per cent. of the sugar, or 32,500 tons, worth £812,000, drains away on the voyage, and is lost to the West Indian producer—who thus in reality receives in round numbers £9,100,000 instead of the £22,500,000 he might earn. In fact, he loses 60 per cent. of his possible gains. This waste is so great as to be almost inconceivable, and a year ago, when these statements were brought before the West Indian planters, they were dismissed as highly exaggerated amounts by those gentlemen. However, the rapid spread of beet cultivation on the Continent has caused cane planters to look more closely into their system of late, and a great change has taken place in their tone; now that the system is admitted to be imperfect, we may look for rapid improvement, for although Englishmen are hard to convince that anything is wrong, when convinced no nation is so quick in setting abuses right. That it is high time to be up and doing is evident. The Continental beet crop in a few years will probably reach 1,000,000 tons. The beetroot in the best German factories (that, for instance, of Herr Robert, at Seelowitz, in Prussian Silesia), is made to yield 11 per cent. of its weight in actual raw sugar; and advertisements are inserted in the *Journal des Fabricants de Sucre* on the part of Baron Koppy, of Krain, Silesia, offering to supply beetroot containing 16 per cent. of saccharine matter. These results have been obtained by careful selection, year after year, of the richest plants, by the most careful agriculture, and by applying all the resources of chemical and mechanical science to the extraction of sugar; and the advance in the industry may be gathered from the fact that it is not

more than half-a-century old; that the original beet only contained 4 per cent. of sugar; that the percentage has now increased to 16; and that the quantity of sugar obtained from given quantities of root has been doubled within the last ten years. The cause of this difference between sugar manufacturers in Europe and in the West Indian Colonies is not hard to find, and is simply owing to the coddling system pursued; first, by giving the colonial sugars an ostensible protective duty after emancipation; and then by renewing the protection in a concealed form under the system of graduated sugar duties. But such weak barriers cannot control the great laws of supply and demand. Now that the West Indians find that they have been resting on an unnatural protection, which has become worse than useless to them, let them cast their artificial aids aside, by advocating the removal of the scale of sugar duties. Let them at the same time select the richest sacchariferous plants, study agriculture, practical chemistry, and mechanics, and they will secure a rapid renewal of their prosperity.

Commerce.

CONSUMPTION OF SUGAR.—The consumption of sugar, which is known from official returns to be on the increase in England, owes this enlargement to two distinct sources—to the gradually increasing prosperity of the country, and latterly, to the employment of sugar as a substitute for other ingredients, as for instance, in place of malt, for brewing purposes. To form a fair estimate of the sugar consumption of the whole world is impossible (says the *Produce Markets Review*), owing to the absence of returns of the consumption in the tropical producing countries. For the continents of North America, Australia, and Europe, the returns can be had, and are certainly of an interesting character. The total consumption of sugar for Europe in the past year amounts to 1,600,000 tons, of which 900,000 tons were cane, and 700,000 tons beet sugar; the consumption of the United States is 400,000 tons; the Board of Trade returns give the total for the Cape of Good Hope, Natal, Canada, Prince Edward's Island, Newfoundland, Queensland, New Zealand, New South Wales, South Australia, Victoria, together with the imports of foreign sugar into India, as 100,000 tons. If to these be added 30,000 tons for the maple crop, then is obtained a sum total of 2,130,000 tons to represent the consumption of the civilised world. To this large amount has of course to be added the vast quantity of sugar of home growth consumed in India and the other tropical producing countries in Asia, Polynesia, America, and Africa; but in the absence of all data, any estimate of the total consumption of the world must be a mere guess. The following figures will conclusively show the extraordinary fall that has taken place in the value of sugar during the last eight years. Excluding all considerations of the reduction in the sugar duty which took place in the year 1864, the bonded price of raw sugar in England is now 4s. per cwt. lower than at the corresponding period in 1865; 1s. 6d. lower than in 1864; 6s. 6d. lower than in 1863; 2s. 6d. lower than in 1862; 2s. lower than in 1861; 6s. 6d. lower than in 1860; and 5s. 6d. lower than in 1859. The lowest price of lump sugar, also calculated in bond, is now 2s. less than in 1865; 2s. 6d. less than in 1864; 7s. less than in 1863; 1s. dearer than in 1862; 6s. 6d. cheaper than in 1861; 4s. less than in 1860; and 4s. 6d. less than in 1859. To the consumer at the duty-paid price, the reduction is of course still more marked; and, taken in this way, the English price of raw sugar is 4s. lower than in 1865; 1s. 6d. lower than in 1864; 10s. lower than in 1863; 6s. lower than in 1862; 5s. lower than in 1861; 10s. lower than in 1860; and 9s. lower than in 1859. The consumer of loaf sugar can now buy it at 2s., 2s. 6d., 12s. 6d., 4s. 6d., 9s., and 9s. 6d. cheaper than

in the Decembers of the years 1865 to 1859 respectively. The stock of raw sugar in the four principal British ports at the end of the year was 163,086 tons, against 175,167 tons last year; the landings for the fifty-one weeks have been 493,661 tons, against 479,761 tons; the duty-paid deliveries 495,884 tons, against 481,558 tons; and the exports 14,245 tons, against 21,086 tons. These figures show for the four ports a smaller stock of 12,081 tons, an increase in the landings for the fifty-one weeks of 13,900 tons, an increase in the home consumption of 14,326 tons, and a decrease in the exports of 6,841 tons, as compared with the corresponding period of last year.

COTTON IN THE FRENCH COLONIES.—Although the herbaceous cotton plant sometimes grows to a height of from ten to twelve feet, it is not when cultivated allowed to exceed four or five feet in height, as in that case its products diminish both in quantity and quality. In Senegal the cotton plant suffers either from excess of humidity or from drought. The French colonies most suitable for the production of cotton are the Isle of Réunion, Tahiti, and Guadeloupe. At Réunion the Indian cotton plant acquires a quality so far superior, that it is with difficulty that the primitive type can be recognised. Cochin China also furnishes a quality of a medium fineness, the demand for which is very important. The cultivation of this plant no doubt exhausts the soil, which requires to be well manured every year. The beautiful sea island cottons are grown in soils moist from the salt sea air, and susceptible of being irrigated during dry seasons; but in order that they should succeed perfectly, it is necessary that they should be sheltered from heavy winds. It generally seems to prefer the vicinity of the sea in dry countries, and the interior districts of naturally damp climates; these facts lead to the inference that it is not merely temperature by which the quality of cotton is affected, but a peculiar combination of heat, light, and moisture. The land for the cultivation of the cotton plant requires frequent labour. The inhabitants of the Southern States of America perfectly understand this cultivation; their example should be taken, and there is no doubt that even with free labour similar results will be obtained in the French colonies.

SERICULTURE IN AUSTRIA.—The cultivation of the mulberry and silk industry tends to increase in importance every year in Austria. The produce of cocoons for 1864 is estimated at about 133,347 quintals, about 13,134 tons, including the produce of the Venetian provinces. The rearing of silkworms is more important in the southern provinces of the empire, that is to say, in Istria, Carinthia, Croatia; and that industry has also made great progress of late in Hungary and Bohemia, and is carried on on a large scale in Upper and Lower Austria, and to the south of the Tyrol. A much greater development would have been made in the last twelve years if the disease had not made considerable ravages in all the provinces, where it has even in many places completely put an end to the rearing of silkworms. The disease first made its appearance in Austria in 1847, five years later than in France. The country that has most suffered from it is Hungary.

Colonies.

IRON IN TASMANIA.—It has long been known that iron is almost a pure metallic state exists in different parts of the island, and that iron ores are abundant, particularly in the north. So far back as 1823, Mr. Commissioner Bigge reported to the House of Commons that he had discovered ore of Ilfracombe, in the West Tamar District. Mr. Gould, the government geologist, has lately exploring that region more fully, and made a report to the colonial parliament last session on the subject. He says:—There are four varieties; the principal is a earthy brown hematite, crystallised brown her-

and magnetic oxide; the other, which is earthy red hematite, is of more sparing occurrence, and is evidently a mere derivative from the previous ores. Unlike other iron ores which I have observed in many parts of the colony, and which consist merely of hematites formed by the deposition of ferruginous matter from rocks containing a small per centage of iron as an element of composition, these appear to be contained in real mineral lodes, or to be derived from the contents of such, and their formation appears to have been determined by a mineral force acting in defined directions. The ore is of greatest excellence in the lower ground, that at the extreme upper end being inferior in richness and not quite so abundant in quantity. The ore shows itself to be of good quality, however, for more than one-half of the length of the reef, and even the remainder is at least equal to much of the iron ores smelted in other countries. The average width is about 66 ft., the length outcropping 300 yards, and the average slope about 14°. Taking a rough estimate, this gives the cubic contents of the portion of the vein above the water-level at about 705,800 tons. Assuming that only one-half of this is rich ore, we have an amount of 350,000 tons of rich ore lying above the water level, and presenting every facility for being quarried at an exceedingly low rate per ton, the other moiety presenting equal facilities of working; while every yard in depth below the level would yield, on the same calculation, 20,458 tons.

WATER IN NEW SOUTH WALES.—On the Darling Downs supplies of water have been obtained from cones, formed of a crust or deposit, from three or four to twenty feet high. This crust is composed of an admixture of hardened clay with small quartz pebbles, much worn by the action of water. When the crust is broken water spurts out in a small and continuous stream. The water is very clear, cool, and fresh. At one of those natural reservoirs about 10,000 sheep are watered daily, and yet the supply from the cone does not seem to be at all affected. These strange aqueducts may turn out to be as valuable to the grazier as they are interesting to the geologist. The pastoral occupants of Crown lands in the Lachlan districts are taken steps towards securing for themselves permanent water supplies.

NEW SOUTH WALES FINANCE.—According to the financial statement of the treasurer, the public debt of the colony of New South Wales is at the present time £5,624,930, consisting of debentures for £5,240,030, bearing interest at 5 per cent., and treasury bills to the amount of £349,900, bearing interest at 6 per cent. The estimated revenue for 1867 is £2,253,500, and the charges upon it £2,013,992, leaving a balance on the year of £239,513. The revenue received up to the 31st August was £1,240,800, and the estimated amount for the remainder of last year was £786,358, making a total of £2,032,579.

Publications Issued.

TRAITE DES MATIERES COLORANTES, &c. By P. Schützenberger. 2 vols., 8vo. (Paris: Masson and Fils.) An important work on a very important trade—that of dyeing; a treatise on colouring matters, with their applications to dyeing and textile printing; and notices on textile fibres, dressings, and mordants, published under the auspices of the *Société Industrielle* of Mulhouse, and with the aid of the Chemical Committee of the Society, by M. P. Schützenberger, formerly professor of chemistry in the superior school of Mulhouse. The quotation of the above from the title page will recommend this work to all who are interested in the application of colouring matters to industrial purposes. The volumes are illustrated, not only by cuts, but also by specimens inserted in the text. It appears that there was previously no special work on the history of colouring matters in France, and the greater part of the technological treatises which touch the subject were published pre-

vius to the discovery of many of the most beautiful artificial colours now in use. M. Schützenberger, whose work now supplies the void referred to, conducted for more than ten years the laboratory for practical instruction in the school of Mulhouse, and should therefore be thoroughly *au courant* with recent discoveries, while the co-operation of the Mulhouse Industrial Society greatly strengthens his position in a practical point of view. Besides describing the various dyes and other matters employed in dyeing and printing, their modes of preparation and employment, M. Schützenberger gives the means of ascertaining their relative purity, and the methods in use for fixing the colours in dyed fabrics. The manufacture of muslins, in which madder colours play so important a part, occupies a considerable portion of the work, and the actual samples of muslin and silk, produced expressly for the work, amount to more than 70 in number. The book comes before the world with a recommendation, by M. Dumas, of the French Institute.

Notes.

ECONOMICAL WAY OF PRESERVING FRUIT OR POTATOES.—Apples, pears, or potatoes may be easily preserved in the following manner:—A dry and well-ventilated place should be chosen, if possible on the ground-floor; on this a layer, about four inches thick, of rye straw is spread, then a layer of fruit or potatoes of the same thickness, and this is sprinkled with powdered plaster of Paris; on this another layer of straw, then fruit sprinkled with plaster, and so on, till five or six successive layers of straw, fruit, and plaster have been formed. In this manner, potatoes may be kept fresh for some time, and the growth of the long white shoots, so detrimental to their nourishing qualities, and which render them unfit for planting, is prevented.

NEW GAS.—The town of Coburg, Canada West, has been lighted with a new gas, made from pine wood, bones, and refuse vegetable and animal matter. The light, it is said, is quite brilliant, surpassing that manufactured from coal, which had been formerly used, while it will be more economical.

DEPOSIT BANK FOR SEAMEN.—The Board of Trade have established at Liverpool an experimental deposit bank, which, it is believed, will be found highly advantageous. No interest is allowed, but a seaman can at once deposit any amount, and withdraw it at a moment's notice, so that there is now no excuse for his trusting it to the care of people whose only object is to plunder him. When a seaman is going upon a voyage he can have his money transferred from the deposit bank to the savings bank, and then interest is allowed at the rate of three per cent. per annum.

LIVERPOOL GALLERY OF INVENTIONS AND SCIENCE.—The committee of this institution invite the attention of inventors, manufacturers, and dealers, to the advantages which this institution affords them of exhibiting gratuitously in this great commercial centre, models of new inventions, and objects illustrative of progress in the arts and sciences. No charge is made to exhibitors, the object of the founder (the late Sir William Brown, Bart.), and of the committee of management being to render the gallery commercially beneficial to exhibitors, as well as a means of affording interest and instruction to the general public. Forms of application for space, and further information, may be had of the honorary secretary, Mr. Astrup Cariss, 3, Cook-street, Liverpool.

Correspondence.

STORM SIGNALS.—SIR,—I desire to endorse the opinion of your correspondent, Mr. Wilson (see *Journal*, 28th Dec.), representing the system of the late Admiral Fitz-

roy for the foretelling of storms, and to express my regret that it has been discontinued entirely, even for a time. It is well known that the Admiral sacrificed a large amount of time and of money in endeavouring to improve the system, and there can be no doubt that, to some extent, he was successful in his predictions, or forecasts, as he termed them. It is my intention to search the records, at some convenient time, for the purpose of ascertaining whether my idea be correct, namely, that in two cases out of three his forecasts were verified by the event, according to his statement in 1862, that "by continued and consecutive series of charts, several hundred in number,—constructed on the synchronous principle,—an insight into the laws of our atmosphere has been gained which has enabled us to know what weather will prevail during the next two or three days, and, as a corollary, when a storm will occur." I hope that, at least partially, the system may be continued as suggested by your correspondent.—I am, &c., **CHR. COOKE.**

31st December, 1866.

MEETINGS FOR THE ENSUING WEEK.

- Mon.**.....R. Geographical, 8 $\frac{1}{2}$. 1. "A Journey to Kano from the Niger;" by the late Dr. W. B. Baikie. 2. The Bishop of Mauritius, "On the North-east Province of Madagascar." 3. Lieut. T. H. Lewis, "Diary of a Hill Trip in Burmah." British Architects, 8.
Medical, 8.
- Tues.**.....Civil Engineers, 8. Mr. John Bourne, "Ships of War." Statistical, 8. Dr. Mouat, "On Prison Statistics of India." Pathological, 8.

Journal of the Society of Arts.

FRIDAY, JANUARY 18, 1867.

Announcements by the Council.

NOTICE TO MEMBERS.

The Council have decided to set apart the first Wednesday in each month, during the present Session, for the discussion of various questions connected with Arts, Manufactures, and Commerce; these discussions may commence either with or without the reading of a paper.

Any member desiring to introduce a subject for discussion should give notice of it to the Secretary, and, if approved by the Council, it will be announced in the *Journal* for one of these evenings. The member who opens the discussion must not occupy more than half-an-hour, but will have the right of reply. No division is to be taken.

On the evening of Wednesday, the 6th February, Mr. Henry Cole, C.B., will introduce the following subject:—

“On the existing legal regulations in reference to the Cab Fares in the Metropolis, and their effect in rendering the Vehicles inferior to those provided in other European Capitals and the large Municipal Towns of this Country.”

ART-WORKMANSHIP PRIZES.

The works sent in competition for these Prizes are now placed in the Society's Great Room for the inspection of members and their friends.

ORDINARY MEETINGS.

Wednesday Evenings at Eight o'clock:—

JANUARY 23.—“On the Iron Permanent Way used on German Railways.” By T. A. ROCHUSSEN, Esq.

JANUARY 30.—On this evening the Report from the Judges on the Art-Workmanship Competition will be read, and the competitors and their friends will be invited to be present. Sir THOMAS PHILLIPS, Q.C., Chairman of the Council, will preside.

CANTOR LECTURES.

The following is the syllabus of the course of Six Lectures “On Pottery and Porcelain,” illustrated by specimens of various manufactures, and by photographs and diagrams, to be delivered by William Chaffers, Esq.:—

LECTURE I.—MONDAY, JANUARY 21.

ANCIENT POTTERY.—Introduction. Assyria and Chaldea, Egypt, Greece, Etruria, Rome, &c.

LECTURE II.—MONDAY, JANUARY 28.

MAIOLICA.—Italy, Spain, Persia, &c.

LECTURE III.—MONDAY, FEBRUARY 4.

PAYENCE.—France, Spain, Portugal, Russia, Sweden, Denmark, &c.

GRES OR STONE WARE of Germany and Flanders.

DREFT WARE, &c.

LECTURE IV.—MONDAY, FEBRUARY 11.

ORIENTAL PORCELAIN.—China, Japan.

LECTURE V.—MONDAY, FEBRUARY 18.

EUROPEAN PORCELAIN.—Italy, Germany, France, Holland, Belgium, Russia, Poland, &c.

LECTURE VI.—MONDAY, FEBRUARY 25.

ENGLISH POTTERY AND PORCELAIN.—Early History, continued to the beginning of the 19th century.

The lectures will commence each evening at eight o'clock, and are open to members, each of whom has the privilege of introducing one friend to each lecture. Tickets for this purpose were issued to each member with last week's *Journal*.

SUBSCRIPTIONS.

The Christmas subscriptions are due, and should be forwarded by cheque or Post-office order, crossed “Coutts and Co.,” and made payable to Mr. Samuel Thomas Davenport, Financial Officer.

Proceedings of the Society.

SIXTH ORDINARY MEETING.

Wednesday, January 16th, 1867; Rear-Admiral Sir EDWARD BELCHER, K.C.B., in the chair.

The following candidates were proposed for election as members of the Society:—

Agnew, William, Manchester.

Angier, Samuel Haynes, 72, Cornhill, E.C.

Baragwanath, J. P., 153, Upper Thames-street, E.C.

Bingham, Reuben, 1, John-street, St. James's-sq., S.W.

Bonnor, George, F.R.G.S., 42, Queen's-gate-terrace, Kensington, W.

Bradfield, J. E., 2, Strand, W.C.

Chaffers, William, F.S.A., 19, Fitzroy-square, W.

Gard, Richard Sommers, Rougemont, Exeter.

Kitchin, Joseph, Dunsdale, Westerham, Kent.

Lobley, James Logan, F.G.S., 50, Lansdowne-road, Kensington-park, W.

Lubbock, Sir John, Bart., F.R.S., 15, Lombard-street, E.C., and High-elms, Farnborough, Kent.

Middleton, Thomas John, 79, Long-acre, W.C.

Muspratt, Edmund K., New-hall, 41, Old Hall-street, Liverpool.

Ommaney, Rear-Admiral Erasmus, F.R.G.S., 6, Talbot-square, Hyde-park, W., and United Service Club, Pall-mall, S.W.

Paine, Thomas, Banbury.

Pearce, J. D. M., A.M., Craufurd College, Maidenhead.

Ramsden, J. C., Busbridge-hall, Godalming.

Seaton, John Louis, 93 and 95, Hampstead-road, N.W.

Shaw, James Jesse, 2, Hill-road, St. John's-wood, N.W.

Somerton, The Viscount, Roche-court, Salisbury.

Thomson, John Reid, 18, Highbury-place, N.

Ward, John, 107, London-wall, E.C.

The following candidates were balloted for, and duly elected members of the Society:—

Addis, S. J., 49 and 50, Worship-street, E.C.

Becke, John, Northampton.

Bosanquet, Samuel Richard, Dinastow-court, near Monmouth.

Glendinning, Alexander, jun., Redleaf.

Jobson, Robert, 32, Great St. Helen's, E.C.

McCrirrick, T. W. Bitterley-court, Ludlow, Salop.

The Paper read was—

ON MERCANTILE MARINE LEGISLATION AS AFFECTING THE NUMBER AND EFFICIENCY OF BRITISH SEAMEN.

By CAPT. HENRY TOYNBEE, F.R.A.S., F.R.G.S.

Having spent the last thirty-three years of my life amongst seamen, I have been struck with the importance of some of their wants, and have been trying for some years to get those interested in their welfare to take up the question of their social position, and deal with it in a broad and comprehensive manner.

It is my intention to confine myself to the subject of seamen in this paper, although some important changes might be made in the training and examination of young officers, especially as to hygiene, navigation, and the general government of a ship at sea, where there is no appeal to law.

The scarcity of British seamen, and the tendency to discontent which is showing itself in the east end of London and in several of our seaports, makes it more important that those who understand them thoroughly should come forward and explain what really is wanted, for we can hardly expect a class of uneducated men, many of whom are very much demoralised by the peculiar treatment they have received, to devise and carry out the best remedies for their just complaints, even if the power lay in their hands.

Here let me draw a broad distinction between the reasons for complaint mentioned in this paper, and the suggested remedies. The former are facts to be dealt with, the latter are only the ideas of a single person.

On thinking over the subject it seems that several of the improvements must emanate from our Government, by some slight changes in mercantile marine legislation; and as Mr. Graves, M.P., gave up the idea of a Royal Commission to Inquire into the State of our Merchant Seamen, on the promise that the present Government would go carefully into the subject, this seems to be the time to form a committee of practical men, who are interested in and connected with seamen, with the object of considering carefully what improvements are needed, and then to go in deputation to the President of the Board of Trade to ask him to listen to their suggestions. If I may judge from the way in which Sir Stafford Northcote has publicly asked for information from practical men, and the courteous manner in which he has listened to private individuals, I cannot be mistaken in saying that he will appreciate the endeavours of such gentlemen, and give their suggestions full weight in deciding what is to be done for our seamen.

November 5th, 1866, the Newcastle and Gateshead Chamber of Commerce memorialised the President of the Board of Trade, begging him to appoint an inspector of ships, and a public law officer to inquire into wrecks, from a conviction that an immense amount of life and property is lost from preventable causes.

Again, November 20th, 1866, one hundred and seventy seamen of the north-eastern ports sent in a petition to the Board of Trade, to which I shall allude by and bye. So we have shipowners and seamen petitioning the Board to interfere.

As the question of inspection will come under consideration, it may be well to say that I have read Mr. Gray's deeply-interesting and suggestive paper, on "Mercantile Marine Legislation," which was read before this Society. One weak point in the style of legislation of which he complains, seems to be that room is not left for progress, and it does not seem judicious to legislate absolutely on a progressive science; for instance, the building of iron ships was in its infancy, and the Act might have required three or more water-tight bulkheads, leaving it in the power of Government to require greater improvements in new ships (after giving full notice) as the science advanced.

Then, again, in the inspection of boilers, boats, anchors, cables, &c., where the inspector may be wilfully deceived, it seems that it should be clearly

stated that inspection does not relieve the party whose property is inspected from responsibility, just as in the case of troop and emigrant ships, where this is distinctly stated in the charter-party, for we must never forget that the argument of prevention being better than cure is in favour of inspection before mischief is done; and we can well suppose our government saying to shipowners and commanders, "the lives and property of our subjects are of so much importance to us, that we will do all we can for their protection before you sail beyond the reach of our laws, but the responsibility rests entirely with you that the object of this inspection is not evaded." I think all will allow that in every class there are still too many to be found who will gamble with the lives and property of others, if they imagine they can gain by it; and these laws are made to restrain such people. They protect the good and straightforward business man.

The above remarks allude chiefly to legislation on progressive science, in which case it may be supposed that the inspector himself may not be sure that his requirements are the best, but there are some cases in which legislation may have to deal with subjects so well understood as to more nearly resemble exact sciences; such as encouraging any class to be provident, giving limejuice and preserved vegetables to those who live on salt meat, giving human beings dry, light, commodious, well ventilated and drained places to live in, encouraging steady religious habits and social improvements, and keeping up a full supply of men to carry on the commerce and defence of the country.

It is the bearing of our mercantile marine legislation on these subjects, as regards British seamen, which I have undertaken to deal with this evening.

1st. With regard to making our seamen provident. For 104 years Government required each merchant seaman to pay a shilling a month, and each master two shillings, towards the Merchant Seamen's Fund, "for the relief and support of maimed and disabled seamen, and the widows and children of such as shall be killed, slain, or drowned in the merchant service." For 87 years half this money went towards the support of Greenwich Hospital, the rest being left in the hands of local committees to manage, whose rules were based on defective calculations, and they got into difficulties, which led Government in 1834 to give up taking a part for Greenwich Hospital. But even this was not a sufficient remedy, and in 1851 the last resource was to give up compelling seamen to subscribe, and only continue a modified benefit of the fund to those who were wise enough to subscribe voluntarily for the future, after being told that the fund was bankrupt; giving no compensation to men who did not continue to subscribe, even though they might have paid towards it nearly all their lives. The instrument by which this change in the law was carried out is called "An Act to amend the Act relating to the Merchant Seamen's Fund, and to provide for winding up the said fund." It tells us that it "can no longer be carried on with benefit to the British merchant seamen," and that the Queen acts "by the advice and consent of the Lords Spiritual and Temporal and Commons." How these gentlemen soothed their consciences before giving such cruel advice is more than I can understand.

An explanatory paper was circulated, but many seamen never think of examining even their accounts, so that no doubt thousands never knew that any change was made; and it would require a long explanation to prove that Government did not virtually promise to give to each seaman the benefits set forth in the rules of the fund, when it compelled him to subscribe to it. Some millions were paid by the country to buy off slaves, and it would have been but mere justice to have kept faith with her seamen.

I am quite inclined to let bygones be bygones, and only mention this as an argument to prove that our seamen have a strong claim for a well-devised pension fund and life insurance to support themselves and their

families; and there are good reasons for believing that Government is preparing to establish these in connexion with shipping offices, so that now is the time for practical suggestions. They should be adapted to the circumstances of seamen, by allowing long-voyage men to pay lump sums, each payment being a closed transaction; a provision should also be made for the payment of advance notes into the fund or life insurance instead of to the seamen. But the details might be gone into by the proposed committee.

Again, the unclaimed wages and effects of deceased merchant seamen (which it is not necessary to retain for the purpose of satisfying claims) amount to about £7,000 a-year; this is paid into the Consolidated Fund of the United Kingdom, where it must have accumulated to a very large amount since Government first received it. But surely the United Kingdom might allow this to form a benefit fund, to meet the distressing cases which abound in sailors' families.

Again, scurvy has increased threefold in the last few years in our merchant ships. Medical men are unanimous that it ought not to exist, and that it is caused by a continuance of salt food, without good limejuice or vegetable diet, aided, in many instances, by the tendency to fever which is induced by small, damp, badly-lighted, badly-ventilated forecables.

A paper on scurvy was read a few weeks since, at the Hunterian Society, by Dr. Dickson, R.N., Medical Inspector to the Custom House and Board of Trade. He showed some vile specimens of so-called limejuice, taken from scurvy-stricken ships, and said that even when good, at the commencement of the voyage, it was frequently spoiled by being kept in large casks instead of bottles. We were told of a firm that bought limejuice at 2s. a gallon, and sold it to ships at 1s., after doctoring it. The scientific society of medical men who listened to this paper were most indignant, some even declaring that the owner of the ship in which a man died of scurvy should be proceeded against for murder; this would be extreme, but something must be done. The Secretary of the Board of Trade and the Registrar-General of Seamen have published a most interesting correspondence with local marine boards, foreign consuls, &c., confirming the fact that scurvy need not exist, and I believe they are prepared to take active measures against it.

Then, again, comes the question as to the quality of provisions for seamen. Soldiers and emigrants have good salt provisions, as well as limejuice, pickles, preserved potatoes, &c., and these improvements must be introduced into the dietary scale of seamen. They also need good glazed lanterns, or lamps, and a certain amount of oil or candles; as it is they generally have open lamps, which are very unsafe; and they are often obliged to burn the fat of salt meat, instead of oil, which gives more smoke than light, adding to the unhealthiness of forecables.

There are men of high principle amongst shipowners, who, whether they own only half a ship or a whole fleet, are determined to act justly towards those they employ; to them it is only requisite to suggest required improvements; but there are others whose one object is money, and the question is how are these last to be prevented from endangering the existence of British seamen by their treatment of them. Again, there are provisioners who take the smallest possible share in a very large number of ships, with the understanding that they shall have the supplying of the provisions. This is quite right in a business point of view, but the temptation to supply cheap provisions comes heavier on them than on other shipowners.

In my search after facts, I went to one of our very best provisioners, and asked the price of beef that would pass inspection for troops; he answered £9 6s. per tierce of 336 lbs., which for the ordinary tierce of 304 lbs. would be about £8 7s. I then asked what is the price of beef supplied to the crews of ships? He answered, from £5 10s. to £6 10s. per tierce of 304 lbs.

With regard to pork, he said it ranged from £4 10s. to £5 15s. per barrel of 200 lbs.; but he showed me a list of prices from another English port, where it ranged from £3 5s. to £3 15s., but he said this is stuff that you could squeeze through your fingers like lard. He went on to say that in flour, peas, and other stores, a few shillings per barrel were often saved by a close-fisted firm, and he volunteered to say that seamen do suffer very much in times of bad freights; for instance, he himself had just lost the custom of two firms which he could not supply cheap enough, though he confessed he was sometimes driven to sell articles inferior to what he would like to give to seamen, for if he did not, he might shut up shop. When I asked if all these firms improved the quality of the provisions given to their men when freights improved, he gave a significant smile.

Here then we have a difference, depending on the character of the shipowner, of £2 7s. in the price of 304 lbs. of beef, or 2½d. per lb., and £2 10s. in that of 200 lbs. of pork, or 3d. per lb. These differences exist in the price of food which ought to be about the same quality for all.

I have also received a letter from a London shipowner, in answer to certain questions. He says his firm always gives the best quality of provisions, but he fully confirms the fact that some ships buy the cheapest, and that in London there is a constant difference between the prices of the best and worst as extreme as alluded to above. He remarks on three qualities of biscuit, viz., royal navy (very good), navy (a second quality), and ship (lower still), but he does not give the prices. He says they give 2s. per gallon for limejuice, and 4s. each for five-gallon jars to pack it in; but he adds, stuff called limejuice may be had at 6d. per gallon. To enable you to understand the paltriness of this saving, you must know that a gallon of limejuice is more than the allowance of a seaman for a voyage to India and back. He tells me that American ships seldom take limejuice, but potatoes, dried apples, beans, pickles, corn flour, and biscuit equal to our "royal navy," so that scurvy is rare with them.

I may add that the agents for Government emigration have been so troubled by the provisions for seamen being worse than those for emigrants, that they have a clause in the charter-party requiring them to be of the same quality. Not (as they say) because they have any interest in the seamen, but merely to protect the emigrants from getting worse provisions, or the risk incurred by the seamen's discontent.

Then, again, comes the question of forecables. By Act of Parliament seamen should have nine superficial feet of deck if they have hammocks, and 12 if they have bunks—but nobody measures it; whereas emigrants have 15 ft. Again, soldiers have from 10½ to 22 superficial feet, depending upon whether they are in health or sick. It has been proposed by Mr. Mackay, a large shipowner, that seamen should have 15 superficial feet, that their light and ventilation should be under the control of Government, and that something should be done to prevent the sea from washing them out of topgallant forecables when the cables are bent. He says, "at present in flush-decked ships the forecables, which are under two decks, have neither light nor ventilation, while topgallant forecables are generally so much exposed, as to set even decency at defiance;" and ends a graphic letter on the subject by saying, "shipowners have a right to see sailors lodged at least as well as their dogs and pigs, and then they may probably hope to see them more under the influence of sober reason than the recklessness of wicked instincts."

I have myself seen sailors' chests and beds filled with water in at the hawse holes of topgallant forecables, and know that commanders are frequently prevented from bending their cables so early as they otherwise would, and ought to do, on account of the discomfort caused to their crews by the seas coming in at the hawse holes. A simple remedy is a good manger, with scuppers

and when once at sea, they have no redress, and cannot escape, even though their forecables may be uninhabitable, and their meat that very stuff salted, which would have been seized and buried had it been exposed for sale in the markets on shore.

The present state of forecables, bad quality of lime-juice, and of some ships' provisions, together with the three-fold increase of scurvy, show that the let-alone system has not worked well in our mercantile marine.

But as some think the routine inspection of every ship is ineffectual, and as in practice I have always found that the best way of governing men is to let them know their rights, making them aware at the same time that it was my full intention to make them do their duty, it might be well that the heading of a ship's "Articles" should contain some of the important rights of seamen, such as a new scale of provisions, to be of good quality; the size, light, ventilation, drainage, fittings, &c., required for forecables; these will suggest the few very inexpensive changes needed; and when it is generally known what should be done, it will be done, for there is not one of these changes which our first-class ship-owners will not allow to be reasonable, for some of them give them already. This will make it requisite that the shipping-masters shall be empowered to have an inspection of provisions, forecables, &c., when a reasonable complaint is brought to their notice.

Sir Stafford Northcote, in his speech, when visiting the training-ships of Liverpool, remarked upon the splendid accommodation given to the poor boys on board, which led him to ask if the shipowners had taken care to provide them with similar accommodation when afloat. No reply was given to this most practical question. Again, in the account of the opening of the *Chichester*, a training ship for poor boys in London, we were told the cheering fact that she was started because most of the destitute boys show a decided taste for the sea; and if their country and employers will consider their wants as they grow from boys to men, single, married, and worn out, then they will continue useful members of society. Sir Stafford Northcote's speech on this occasion gives proof that he is fully awake to the real wants of the merchant service, and supports the conviction that something practical will soon be carried out.

It must never be forgotten that by becoming a sailor, and being provided for from a child, a boy does not acquire that habit of providing for himself which naturally grows on a landsman; in fact the circumstances of his most useful profession launch him into the world a man in appearance, but a perfect child as to management; this weakness is called open-heartedness, and gives that charm to his character which his country men and women admire, but have not provided against; when he comes on shore he really is like a shell-fish that has crept out of its shell; and, unfortunately, he supplies abundant food for thousands of land sharks, who are a nuisance to our sea-ports, but who will decrease if you will help sailors to face their difficulties.

Up to the present time the sympathies of the nation seem to be with the "Comical Sailor," who drinks too much grog, dresses extraordinarily, rolls as he walks, smokes tobacco, and takes a couch for himself, another for his stick—not with the steady sailor, who, on going to sea must leave his old family unprotected. In fact, it would seem as if the idea that we have descended from monkeys was (in public mind) illustrated by sailors, and that they must yet fit to be treated as human beings. If this be the case once, the strictest disciples of this theory will allow that there is progress, and we are prepared to see that British seamen have arrived at such a stage that they will be very grateful if you will treat them as men.

In the "Act" requires that seamen shall be paid their wages directly their services are no longer required, the rest to come to them on pay day, i.e. from five days after the ship's arrival. This giving

part of the pay on arrival is not done by very many shipowners, because the sailor does not know that he has a right to it. A simple remedy would be to enter the requirement in the heading of the "articles." Few are aware that after seamen have served a shipowner for months, or even years, the custom is to turn them adrift without a penny of their wages, and to leave them in this state from three to five days. The result is, they are generally driven to borrow from men and women who live by demoralising and fleecing them.

Again—married sailors, and those who have friends living at a distance from the port of arrival, suffer extremely by being kept waiting from three to five days until pay-day. They are necessarily idle, and surrounded by powerful temptations. We once heard a shipowner say, when a pressure was being made to pay the crew of a ship two days earlier than usual, that the interest of £1,000 for two days was worth something, so he checked this hurry, but he would not have done it had he known what misery the delay created. A very simple sailor's view of the question is, to do as the Royal navy does, viz., pay seamen including the day on which they receive their money; this would reduce the number of days they would have to wait.

But this waiting, doing nothing, has so baneful an influence, that Mr. Greatorex says, "A sailor must not have to wait at a sailors' home or boarding-house until he is paid off before he can go to his family. The chief mischief arises within twenty-four hours of his first putting foot on shore." It is true, these men come on shore after a long voyage with the best intentions, but these painfully trying circumstances beat them. As a remedy, I propose that Government provide dock clerks in connection with shipping offices, whose duty it shall be to visit ships as they enter the docks, and when the crew have made the ship fast, and are no more required, to request the captain to muster them, and see that each man gets part of his pay at once; to get from the captain a book containing a list of all claims against the crew for slops, fines, stoppage of pay, &c., &c.; to read over these claims to the crew, and take their signatures; he might also enter into this book the date each man commenced to serve the ship, and then there could be no further dispute as to wages. This book might be carried by the clerk to the shipping office, and be considered as the sailors' signature to the release after the shipping master had received his wages. Then let this clerk offer to take the address of any man who wished to go home to his friends, promising to send the rest of his pay and papers after him by post.

This would add immensely to the social improvement of seamen and their families; and they are so useful to the country that they deserve this care, especially when we remember that it is the circumstances of their profession which rob them of the habit of caring for themselves. I myself have strongly felt this inaptitude for managing on shore. Here, as in spiritual things, the children of darkness are wiser than the children of light; the crimps and bad women are on the *qui vive* to be down on their prey; let Government take a lesson from them, and provide children of light in the shape of dock clerks.

A case in point will illustrate the want:—Last November a sailor arrived in London after a voyage of two years; his wife was at Shields; she came to London, found him at the "Sailors' Home;" had to take lodgings, and they were detained two or three days waiting for his pay before they could start off to their family at Shields, of course, complaining bitterly of their expenses. This woman knew the sad temptations to which her husband would be exposed, and took the wisest course, for numbers of husbands yield, causing untold misery, and those who have felt what these temptations are will be the last to cast a stone at the poor fellows.

The Board of Trade has made some useful steps in this direction; let us hope they will go on. They have seamen's savings' banks and money orders, which latter

they have extended to several ports on the Continent, and are going to extend to fifty more. Sailors send large sums home. Each voyage mine have sent from twenty to forty pounds, besides half-pay.

Besides the above causes, the relative decrease of British seamen and their deterioration in ability, may be ascribed to the doing away with compulsory apprenticeship. By referring to data supplied to me by the Registrar-General of Seamen, I find that in the last 16 years our apprentices have decreased from forming 20 per cent. to being only 9 per cent. of all hands employed in vessels belonging to the United Kingdom; whilst in the last 14 years foreigners have increased from forming 4 per cent. to being 9 per cent. of all hands employed in vessels belonging to the United Kingdom. Again in 1858 we had not half so many foreigners as apprentices and boys; whilst in 1865 we had 217 more foreigners than apprentices and boys. Lastly, in 1858, 14 per cent. of our A.B.'s (able-bodied seamen) were foreigners; whilst in 1865, 22 per cent. of our A.B.'s were foreigners. These facts plainly show that we are fast growing to depend on foreigners for our merchant seamen, who, in case of war, might man the ships of an enemy, but not our own. If it be decided that compulsory apprenticeship cannot be again resorted to, it then becomes a question for Government to decide how English boys are to be turned into sailors to work our ships, instead of introducing foreigners.

In these days of free trade, when competition is so painfully strong, if shipowners find foreigners cheaper than apprentices, public spirit must not be expected from them. There are lots of English boys who wish to go to sea, and England wants them. The idea of training ships is, I believe, receiving careful consideration; and if the boys from these ships are not sufficiently popular to induce shipowners to take them, then Government will have to consider what advantage shall be given to ships who carry apprentices without their paying premiums.

The next question I propose to deal with is the social condition of married men and their families. Its importance outweighs that of any other which I have brought to your notice. In their treatment the fixed laws of human nature have been as much neglected as nature's physical laws would be if we tried to confine high-pressure superheated steam in a tin boiler, or if we stowed our gunpowder in the oven.

Is there one gentleman in this room who is not married, or has not thought of marriage, and what is the effect on a nation or class if obstructions are thrown in the way of marriage? Your own minds answer the question better than any amount of words. The East-end of London and our seaports are running over with vice, the result of this restriction on seamen; and if Government passed a law to shut up all houses of bad fame and gin shops tomorrow, they would not check the vice; this shows the weakness of laws for which a class is not fitted, and that part of a Government's work is to improve the characters of its people. Christianity (hand in hand with its child, social science) must prepare a people's minds; it is by this means that the character of the nation has been gradually rising and fitting different classes for improvement; and let us hope that they are going to begin the Herculean task of cleaning those Augean stables, our seaports.

Even now our best and steadiest seamen are men who have married, who can leave their wives and families with half-pay and comparatively well-placed, such as living with their relations, &c., showing that there are no invincible difficulties in the way of sailors marrying. But the amount of misery and vice which are induced by leaving women without half-pay (a number of shipowners will not give it), crowded a whole family in one room which is not properly fitted, surrounded by the strongest temptations to do wrong, is beyond the power of ordinary conception.

Something must be done, and let us

ment, shipowners, merchants, and the public will each and all give a helping hand; it is not money as a gift or charity, but due consideration, that these people want.

In these times of steam and telegraph, when monthly notes can be quickly stopped if seamen run away, they ought to be given. I have never lost by giving them, and if the risk to others is so very great it might be insured against. At any rate, this misery should not be allowed to go on. But there are two sides to this question of desertion. It is true that in Canada and some of our gold colonies, where labour and seamen are scarce, the love of change, together with the promises of bettering themselves which the crimps hold out, do lead many seamen to desert from good ships, but it must be borne in mind that the crimps may be said to depend for their livelihood on ships changing their crews, and much of the fault is theirs.

But there are other ports, such as Calcutta, where native labour is very cheap, and seamen can be obtained at as low or sometimes lower wages than in England. There a seaman costs his ship about 2s. or 2s. 6d. a day, whilst a native can be got for sixpence. This offers a premium to commanders to bring about desertion; and it is notorious that some commanders, voyage after voyage, part with nearly the whole of their crews as soon as possible after the ship's arrival, whilst others never lose a man.

If, by harsh treatment, desertion can be brought about, all the better for the ship, as the owner gets the balance of a deserter's pay, and his clothes if he leaves any; but if this happy result cannot be effected, then the next best thing is to discharge the men by a called "mutual consent," and ship another crew just before leaving port at perhaps a lower rate of wages. The result of this pernicious system is, that whilst seamen are scarce in England, they are too abundant in Calcutta and other ports, where thousands are driven to spend several weeks amongst cheap drink, strong temptations, and bad climate, which help to destroy both body and soul. I do not say that shipowners instruct their commanders to treat their crews in this way; perhaps most of them do not know it. It is the fault of commanders being anxious to reduce their expenses as much as possible; and we have known cases where they bragged of the results. The effect of this is, that shipowners will not give half-pay to the wives and families of seamen, and we have known commanders advise them not to do so.

Far be it from me to teach commanders to neglect the owner's interest; one of my first lessons to officers has been that the object of the voyage is to make money; but it would be far better to die than to make it in such a way as this; and the man who will rob his crew to serve his employer, will rob his employer to serve himself.

I would suggest as a remedy that shipping-masters may be empowered to require that a commander shall ship another immediately on discharging a man abroad; and that vessels engaging a crew to be discharged abroad, shall be responsible that they get ships, or send them home, in spite of any agreement to the contrary; and again, that the wages and effects of deserters (less any fair claim the shipowner may have for reimbursement) shall go, with those belonging to deceased seamen, and help to form a benefit fund for sailors and their families.

Then again, Alderman Waterlow has shown us that good dwellings can be built for the working classes to pay full five per cent. to the builders; and I beg the friends of seamen to start a company to build married sailors' homes, giving them and their families the full value of their money. Now, I see by the Merchant Seaman's Act, 1854, that by the consent of her Majesty's Secretary of State for the Home Department, public lands in seaports may be granted for the building of sailors' homes, and I would ask Government to aid this movement by granting a piece of land for a married sailors' home. You have built them for single men;

but, like other sea creatures, a sailor goes through various transitions, so that when he leaves his sea-shell he needs a land-shell to live in. Thus, you have provided for one stage of his existence, but you have quite forgotten that he has another, which is really one great cause of the misery we complain of.

Mr. Greatorex, Chaplain to the Sailors' Home in Wells-street, has supplied me with a case in point. He says, "I have never known, neither have I heard of a sailor's wife misconducting herself if she was a steady woman before they married; they will bear the greatest privations." He then gives a case of a woman (the wife of an A.B.) of unimpeachable character, with five children in one room, without half-pay, almost without clothes, she covering umbrellas at 2s. a dozen, which brings in on an average 4s. a week. She had six articles of clothing for the four younger children, and three for herself, including her stays. The eldest boy earned 2s. a week. There were six other families in the same house, so that those who think that our building commodious homes and letting them for the same money as they are now paying would be bringing them too close together, ought to go and see where these people are now. Mr. Greatorex ends his letter by saying "They are always packed far closer in the houses they live in than they could by any possibility be in any married sailors' home."

The result of these restrictions is that numbers of sailors dare not marry; and the women with whom they are brought in contact are a disgrace to the animal kingdom. A sailor may love his parrot; and I have seen one cry over his dead cat; but he cannot love the woman who dupes, drugs, robs, diseases, and leaves him minus the best part of his clothes. We must remember that these wretched women die off quickly, and there are young children now training to take their places. Any human being with a spark of Christian feeling must grieve over this state of things.

What, if we have discovered by the decomposition of light what the stars are made of, and are making rapid strides towards understanding the laws of nature, are we to rest satisfied, and plume ourselves on our progress, with whole classes of our fellow-creatures morally rotten, who could be elevated if we would treat them in accordance with, instead of contrary to, the laws of our nature. It is a curious fact that France is just discovering a want of men, and encouraging marriage in the army at the age of 24, whilst our own army is suffering sadly from the restraints on marriage, and we have 22 per cent. of our A.B.'s foreigners, which seems to point to the fact that we have been making a great mistake in discouraging marriage. In spite of all first appearances, every new truth that is elicited on a subject tends to prove that we gain by doing right.

Another great want is Sailors' Institutes or Clubs, like the one in Shadwell; they are especially needed for sailors belonging to ships in ports which are not their homes. For instance, Calcutta has generally 3,000 seamen on board ships in the port, who go on shore for recreation. The "Home" provides for the two or three hundred who must live for a short time on shore, but not for the 3,000 afloat. Sir John Lawrence has kindly granted a fine playground for seamen, and said that he saw no reason why an Institute should not be built upon it. This would be a grand step. How much good would be done if other governments would follow his enlightened example.

Lastly, the religious improvement of seamen is chiefly in the hands of their commanders and officers, though owners can do much. The few zealous ministers who are devoted to them whilst they live on shore, are unanimous in saying that the social improvements for which I have been pleading are absolute necessities, before any real progress can be made in the moral and religious elevation of the British seaman.

Allow me to add that I am opposed to mere giving of money (so-called charity) for the improvement of our

seamen. What we need is that style of heart and head work which may lead them to spend their own money well. We want to divert the immense sums which they waste on vice to the support of themselves and their families respectably.

Still, as thousands of our seamen have not had the opportunity of providing for their old age—there are 3,000 in workhouses—let me call your attention to the Belvedere, a kind of Greenwich Hospital for aged and worn-out merchant seamen. It is a child of the Shipwrecked Mariners' Society, and after struggling for ten years to get into existence, canvassing nearly every seaport of this wealthy nation, it has, by begging, borrowing, and lastly by going far beyond its permanent means, been able to admit the magnificent number of twenty decayed seamen into its home, and gives to six others out-door relief—a specimen of the unpractical, useless character of that sympathy, so often unmeaningly avowed, for sailors in this maritime country.

Do not mistake me, it is not for London alone; these twenty have been admitted from various ports in Great Britain. I confess to a feeling of shame whenever I think of this small result, but trust that better days are in store for poor Jack. Moreover, although merchant seamen subscribed for 87 years to the support of Greenwich Hospital, the Belvedere committee were refused the loan of surplus tables and forms, &c., which lie perfectly useless there.

And now, gentlemen, are you surprised that, after treating them contrary to most of the laws which govern human nature, our seamen are reckless? Could it be otherwise? But the hardest feature of the case is, that many of their employers say, "Sailors are so reckless it is no use trying to improve them." On the contrary, my wonder has always been how they continue to behave so well.

We need nearly 350,000 seamen to man the ships of the British empire. At this moment our sailors are spread over the whole world, doing most important work for their country, therefore they cannot combine to ask for improvements, but I promise, from a thorough acquaintance with them, that if you will treat them like men, you will never want British seamen.

I will now close with a summary of the changes proposed.

1st. That Government will establish a pension fund and life insurance adapted to the circumstances of seamen and their families, in connection with shipping offices, and join on to them a benefit fund, the principal of which shall be the sums which Government has received, and is still receiving, as unclaimed effects of deceased seamen. Also, that the "Act" be so modified that the wages and effects of deserters shall go to this fund. Also that Government will consider in what way they can discourage giving a month's advance before starting, except as a payment into the pension fund or life insurance.

2. That Government shall put a stop to scurvy in the mercantile marine, by calling for and entering in the heading of the "articles" a new scale of provisions.

3. That they shall increase the space given to seamen to 15 certified superficial feet of deck, and not less than 90 cubic feet of air: also that they shall require the fore-castle to be properly lighted, drained, ventilated, and protected from the sea, as well as from the gas which rises from cargo. Safe glazed lamps and oil or candles to be provided for use; and these rights of seamen to be entered in the heading of the "articles of agreement," and a copy hung in the fore-castle.

4. That dock clerks be attached to shipping offices, whose duty it shall be to visit ships on their arrival, see that the crews get part of their pay, and, if they wish, send them to their homes, promising to send the rest of their pay and papers after them.

5. That shipping-masters shall be empowered to order the inspection of all ships' fore-castles and provisions, or at least those of any against which there is a reasonable

complaint. Again, that shipping-masters abroad be empowered to make commanders ship another man immediately in the place of the one discharged. Also that vessels engaging crews to be discharged abroad shall be bound to provide them another ship or pay their passage home.

6. That Government be moved to provide for the admission of English boys into the mercantile marine, as a means of national defence in case of war, as well as an honest employment of her subjects, instead of allowing them to be supplanted by foreigners.

Lastly, that Government be asked to grant public lands in our seaports for married sailors' homes, sailors' clubs or institutes, and to encourage in every way the social improvement of seamen, who suffer great temptations and privations from the peculiar circumstances of their profession.

In conclusion, I thank the Society of Arts for this opportunity of making known the wants of seamen, and beg that if they consider that a true bill has been made out, they will help to form a committee, and carry out the ideas suggested in the early part of this paper, as we cannot hope that these changes can be effected by the seamen themselves, who so much need them.

DISCUSSION.

Commander Dawson, R.N., expressed his sense of the great ability and moderation with which Capt. Toynbee had brought before them some of the abuses existing in the mercantile marine. Happily, the question of higher wages did not arise. All they required was a little honesty and fair dealing, so as to enable the seaman to use his money to the best advantage. It was right, at the outset of a discussion of this kind, that it should be understood that they did not attack individuals, but the system. There were many very humane, honest, and high-minded shipowners and commanders who did the best they could for their seamen; at the same time, he thought there could be no doubt that these were in the minority. The evils complained of had been in a great measure handed down from past generations, but it was the fault of the present generation if it did not endeavour to raise the position of the seaman and remedy the evils of former times. Captain Toynbee had almost entirely confined his remarks to the state of things with regard to first-class ships, which, however, constituted only a small minority. The larger number trading to all parts of the world were a low class of ships, and the state of many of them, he did not hesitate to say, was disgraceful to the flag under which they sailed. Having referred to Mr. Charles Dickens's graphic description, in the "Uncommercial Traveller," of the "Tasmania's cargo," showing the frightful results of bad food and insufficient accommodation upon the health and life of the passengers, Commander Dawson remarked that that state of things, he believed, prevailed, more or less, in all the low class ships of the merchant service. It was recorded that on the average two cases per week of seamen, perfectly prostrate from scurvy, were received on board the *Dreadnought* hospital ship; but he believed the number of such cases might be estimated at a thousand rather than at one hundred per annum in the Port of London alone. At the same time there were numerous cases of scurvy which did not result in utter prostration. The symptoms were often very obscure at first, and the medical officer of the Seamen's Hospital at Calcutta had stated that he never thought of treating seamen without keeping scurvy in view, feeling, as he did, that the disease might have entered the system, though it had not fully developed itself. At the same time it was a remarkable thing that the dietary scale of the merchant service was very liberal as regarded quantity, when compared with that of the Navy. The great difference must then be in the quality of the provisions, and perhaps one or two items of diet omitted from the former. The great want in these

and it was most important that the limejuice, which only cost two shillings in a voyage to Calcutta and back for each man, should be good; also that a small amount of vegetable food should be added to the present scale. It was estimated by an authority on these matters that the expense for a voyage to Calcutta for a proper amount of fresh provisions was £1 per man, which, with one shilling for limejuice, only made a guinea, and this small sum would get rid of a great deal of this disease. It was to be remarked that scurvy among seamen was almost exclusively confined to British merchant-ships; it was nearly unknown in the French and Spanish services; it was also very rare in our own navy. With regard to the case of the seaman when in port, it was a scandal that he should be forced by a concurrence of circumstances into the vices and evils complained of—that at the end of a long voyage he should be turned adrift penniless into the streets of London for four or five days pending the payment of the wages due to him for the labour of months, perhaps years, leaving him a prey to crimps to supply his necessities in food, clothing, and lodging. In return for this they drugged, robbed, and diseased him, and when he shipped again for another voyage, on the first occasion for any great exertion, he broke down from the effects of maladies contracted while on shore. Many of the evils complained of, he felt convinced, were attributable to the system of not paying the men at the time of their arrival in port, and on that account he was in favour of the appointment of dock clerks, as recommended by Captain Toynbee. He also thought that a system of medical inspection on shipping the crews, as was the case in the navy, was desirable, as it would to a great extent prevent men going to sea in a state unfit to perform their duty. His own opinion was that the suggestions made by Captain Toynbee met very fairly most of the requirements of the case, but if they did not, it was the duty of those who were interested in this subject to suggest other means, for it was clear that something must be done.

Rev. JOHN SCOTT thought it objectionable that particular spots in London should be constituted shipping offices for the payment of crews of vessels, inasmuch as they would form rendezvous for crimps and others, who preyed upon the sailor on his coming ashore. In addition to the dock clerks suggested, he thought it was desirable that wherever there was a shipping office, there should also be a sailors' home.

Captain HUNTER (Deputy Chairman of the London Local Marine Board) took exception to the statement of Captain Toynbee with respect to the scarcity of seamen. As far as he was aware there had been no scarcity of seamen in this country, except just after the period of the short strike that took place for higher wages. The fact was, at present there were more sailors than could get ships; and it was somewhat singular that, notwithstanding the alleged grievances as to bad provisions and bad berths, so many foreign sailors had joined our ships in preference to their own. It seemed to him as if the usage they got in our ships was better than that in their own. He thought it was a good thing that foreign sailors were induced to join our ships, because he preferred them to British seamen, not because they were better hands; but because, for the most part, they were more under control. The number of British seamen was greater now than at any former period. They manned the ships trading on the Australian coasts, as well as those in the East and West Indies. A great deal had been said about the deterioration of the race of seamen, but they could not expect to get as fine men from large cities as were drawn from rural populations. He saw no difference, however, as to the effectiveness of our seamen. The ships made as good passages, and generally came home in better condition than in former days. On the question of scurvy, he thought there was great confusion of ideas on the part of those in high quarters. By Act of Parliament it was provided that

limejuice and sugar should be supplied to the seamen after they had been kept on salted provisions for nine days, but it was well known that salt provisions had nothing to do with scurvy; it was the want of vegetable diet only. He had himself been out eleven months with only salt provisions and vegetables, without any scurvy on board. Since limejuice had been so prominently brought forward, captains had neglected vegetable diet, under the idea that limejuice alone was a preventive against scurvy; and often this latter was of a bad quality, and had no effect. With respect to the berthing of the crew in the forecastle, Captain Toynbee had recommended a manger to carry off the water shipped on deck. He hardly understood how that was to be done, and he thought the only plan was to keep out the water by stuffing up the hawse-holes. With respect to the crimps, he considered that was one of the worst features of the whole affair, and if means were taken to suppress their malpractices the utmost good would be done. As to medical examination of the men on shipping, he hardly thought that could be carried into practice. He cautioned the meeting against interfering too much with ship-owners. Their business was an uncertain one, and of late had not been very profitable. They, like other people, wished to carry it on in their own way, but they had no objection to receive suggestions, and if they were wisely made most important benefits would result.

Dr. LEACH (medical officer of the *Dreadnought*), having had considerable experience in scurvy cases, believed that a regular supply of good limejuice was a sure preventive. It was a well-known fact that in hundreds of ships that which was supplied as limejuice was either citric acid or sulphuric acid, or, in fact, not limejuice at all. He suggested that there should be a proper inspection of that article before a voyage was commenced, as he felt confident that if good limejuice were supplied to the ships the disease of scurvy would be almost eradicated from the merchant service.

Rev. Mr. GREATORREX thought a sufficient case had been made out to call for legislative interference. It had been proved that scurvy was occasioned in a great measure by bad food, the blame of which, he considered, rested upon those who supplied the provisions, a matter in which the seaman himself had no control. As to the accommodation of the crews in the ships, he thought the legislature might step in, as that was a matter in which the seaman was also powerless. As an illustration of this, he mentioned that last spring a vessel which left London, on reaching Dover, was believed by the crew to be so unseaworthy that they refused to go any further in her. An inspector was sent for, who pronounced the ship to be seaworthy, on which the complaining parties were given into custody, and sentenced by a magistrate to six weeks' imprisonment; notwithstanding the vessel was ultimately obliged to put back into Plymouth for repairs. Legislation had provided for inspection in factories and other similar cases; why should it not be applied to the accommodation and treatment of seamen? With regard to the scale of provisions, he suggested that it should be posted up in the forecastle so that the men might know what they were entitled to, and be aware when their rights were infringed. He considered it was a great injustice that seamen should be put ashore in a foreign country on account of sickness from scurvy, mulcted of their wages, and left to get back as they could. He remembered the case of a seaman who was in a hospital at Madras for six months, and who came home invalided, without having received any pay for twelve months. In answer to his application to the Board of Trade, he was told that when the ship returned he could claim the wages due to him. But how could a man without money wait in that way for his pay? Legislation might enact that when a man left a ship for any good cause, he should be paid the wages due to him up to the time of his leaving. With regard to the evils to which seamen were exposed on shore—particularly in

London and other great ports—he thought legislation would help to mitigate them. The moment a sailor stepped on shore he was met on all sides by those who would plunder him. It was quite certain if those questionable characters who hung about the docks were found loitering in Lombard-street they would be removed by the police, and he thought something might be done in that way in the neighbourhood of the docks. With reference to the formation of a fund for the benefit of seamen, he believed from his knowledge of them there was a general feeling in favour of it. They felt that the Government had not acted rightly in reference to the money which had been compulsorily contributed, and for which they got no return. Under those circumstances it might fairly be pressed upon the Government to do something to help seamen to form a fund on which they could fall back in their old age, instead of being thrown upon the workhouse. With regard to "homes" for married seamen, it was suggested that in the principal ports land should be given for the erection of such "homes." That suggestion, however, would not apply to London, from the enormously high price of land; but the case might be met by Government making up the difference between the price of land in the outskirts, and that in the localities where the "homes" were required. Without something of that kind such property could not be made to pay for the outlay; but if that were done, he believed ample accommodation would be provided for married seamen's families, at a cost which it was within their means to meet.

Mr. JAMES JACKSON said this was not the first occasion on which he had had the pleasure of hearing Captain Toynbee plead the cause of the British sailor, and though he could not agree with some of his propositions, he felt he was entitled to the thanks of all who took an interest in the great commercial marine of this country. Captain Toynbee had alluded to the petition to the Board of Trade from the Gateshead Chamber of Commerce. He (Mr. Jackson) thought, however, that that Chamber had to a great extent the remedy in their own hands, inasmuch as the great bulk of the shipping of that port was insured by a system of mutual insurance; and if, in self defence, they insisted upon a proper survey of the vessels being made, very few unseaworthy ships would be sent out. With regard to the alleged scarcity of seamen, and the circumstance mentioned in the paper in connection with Seaham, surely men who were the flower of the merchant service could have no difficulty in getting engaged by the large shipowners of London, who would only be too glad to have such men in their ships. With regard to the fund to which compulsory subscription had been made by seamen for so many years, he had no hesitation in saying he believed the general feeling amongst the mercantile marine was against Government interference in any pension fund for that service. They had been told that for upwards of a hundred years merchant seamen subscribed towards Greenwich Hospital, but they had never received a penny from that institution, while there was a noble building, the Belvedere, which, notwithstanding Captain Toynbee's somewhat depreciatory remarks, he ventured to say was making great progress. He believed there was a disposition on the part of seamen, especially in the outports, to support such institutions. This had especially been shown by the seamen of Sunderland. There had been many munificent donations and subscriptions to that institution, but after the commercial disasters of the last six months it was a bad time to make any special appeal to the public on its behalf. With regard to the fund accumulated from the unclaimed wages and effects of deceased seamen, he believed there was no indisposition on the part of Government to carry out the views of Mr. Henley, who, when President of the Board of Trade, stated that he regarded that fund only as in trust with the Government, and that when any properly established institution was provided to which

that fund would be applicable, it would be given up. He thought the prevalence of scurvy in the mercantile service had been exaggerated. Two of the largest provision merchants assured him that they had not had a complaint of scurvy having existed in any of the vessels which they provisioned for many years. But in the ports of Calcutta and Bombay it was not always that the best provisions could be purchased; and when they found that mistakes were made in the provisioning of a whole army, with the wealth of England at command, as was the case in the Crimea, some excuse was perhaps to be found for not always putting the best provisions on board ship. On behalf of the smaller shipowners, who were not generally represented at meetings like this, he would say he believed the men in the smaller class of merchant ships were better paid and better provided for than was generally the case in the larger class of ships. If it were the case that there was a scarcity of seamen, it was not to be wondered at, inasmuch as the apprenticeship system had been abolished; and owners, instead of training up youths for the service, preferred to carry fancy officers, in the shape of midshipmen, not one in six of whom ever made good practical commanders.

Capt. TUBE (Secretary of the Belvedere Institution) said the gallant chairman would be glad to hear that, though there were at present only twenty inmates in that establishment, the youngest of them was 61, and three were over 80 years of age, and the institution was very highly appreciated by those who received its benefits. On one occasion he heard one of the aged men invoking the Divine blessing on those who had provided such an asylum for poor worn-out sailors. He thought such an institution had great claims upon the consideration of all classes of the community.

Mr. HARPER (secretary to the Salvage Committee of Lloyd's) deprecated the views expressed by one of the speakers, who observed that Government should undertake to remedy these accumulated difficulties by legislation. Government protection had even been invoked so far as to suggest that it should interfere to protect the fair-dealing and honest shipowner, who was regarded as the victim of his own honesty, against the unfair-dealing shipowner who maltreated his seamen. He thought that was a monstrous proposition. He was surprised to hear a gentleman connected with shipping argue that all that had been stated about the condition of merchant seamen was mere fiction. In the discharge of his official duties at Lloyd's he came into contact with a vast number of merchant seamen, officers, and shipowners; and he thought there was no fact more incontestible than that the merchant seamen of this country were, as a class, in the most deplorable condition, physically and morally. There were, no doubt, exceptions, but as a rule the fact was as he had stated it. He thought this state of things was in a great measure to be attributed to the shipowners; but he could not agree that they ought to call upon the Government to interfere. He believed both shipowners and seamen were the victims of competition, which led the former to curtail his expenses as much as possible in order to maintain his business. This was a matter beyond the control of any Government; perhaps, however, with regard to fore-castle accommodation and the quality of food, as those were matters in which the seaman could not help himself, there might be exceptional grounds for Government intervention; but on the other matters referred to, he thought it would be most unsafe to think of appealing to the legislature.

Mr. PEARSELL, as a resident for twenty years in Hull, could state that the most liberal arrangements as to provisions, clothing, and accommodation, were made for the crews of the whaling vessels from that port; and every description of store was provided for a twelvemonth longer than the agreements with the men, in case of the vessels getting ice-bound. He suggested that old ships of war might be fitted up at a small expense for the reception of discharged seamen till they were paid their

wages, a moderate sum being paid by them for the accommodation thus afforded.

Mr. THOMAS GRAY rose to suggest that the discussion of this important subject should be adjourned to a future meeting. He felt that justice could hardly otherwise be done to it. He should be grateful if an opportunity for its full discussion were afforded. It was a part of the subject which he had the honour of bringing before the Society last session, and as such he was anxious that it should be thoroughly considered.

Mr. TEULON said if Mr. Gray would prepare a short paper, by way of introduction, he had no doubt the Council would endeavour to fix an evening at some future time, when the subject might be resumed.

Mr. MACKAY remarked that contradictory views had been expressed by different speakers as to the present condition of our merchant service. From the very good opinion entertained by Captain Hunter, to the sad experience of Mr. Harper on the other side, the right of the matter would perhaps be found midway between the two. For his own part he felt that a good deal of the evil complained of fell as a retribution upon shipowners for the way in which they had treated seamen in former days. There was no question that a great many fore-castles were unfit for the housing of men. The American vessels always had a house on deck for their men, and proper space for seamen was always allowed in the ship's measurement. The four or five days that intervened between the ship's arrival in port and the payment of the men he considered was a dark spot in the system, and led to a multitude of evils, which might be avoided by money being paid on account before the sailors left the ship, so as to keep them out of the hands of the crimps. With regard to the condition of our seamen, we must bear in mind that the number of seamen in 1865 was 197,000, the deaths among whom were about 2 per cent., and those who retired from the service amounted to about 2 per cent. more. During the last seven years he found that the increased demand for seamen amounted to $1\frac{1}{2}$ per cent., so that the annual requirements of our mercantile marine were about 10,000 men. He very much regretted that the apprenticeship system had been abandoned, for it seemed to him desirable that a proportion of the boys of the country should be annually trained for the sea—say 5,000 in the navy, and the same number in the mercantile marine. From that body draughts could be made for the merchant service, and they would have a stock of young sailors who by their training would be able to leaven the unwholesome mass which they had at present to deal with.

Mr. REDDIE remarked that the evils of the delay between the seaman's discharge and the payment of his wages would be obviated by making it compulsory that they should be paid wages up to the day of payment, as was done in the Royal Navy; but he did not agree with the suggestion that old men-of-war ships should be converted into lodgings, and the proposal he had just made would obviate the necessity for such refuges. He sincerely hoped that the question of forming a committee on this subject would not be allowed to drop; and, looking at the intimate connection which existed between the Royal Navy and the mercantile marine, he hoped there would be placed upon that committee naval officers of experience who took an interest in the manning of the navy, for which the mercantile marine must be looked upon as the great reserve. With regard to the number of seamen, stated by Mr. Mackay at 197,000, he believed the total number of the mercantile marine was nearer 300,000, and Mr. Mackay could only have included the registered vessels in his calculation. It was therefore quite clear that no system of training-ships could furnish the necessary supply of seamen for this service. He did not agree with the suggestion that the month's advance to the men should be paid to a pension or insurance fund—[Captain TOWNES said this would be voluntary]—the object of the advance note being to

clear the sailor before he went to sea. There was one recommendation in the paper which he believed both shipowners and seamen would have a decided objection to—that was, posting in the fore-castle the articles of agreement with regard to provisions, &c. It would never do to aid in that way in the manufacture of that abominable class called “sea-lawyers.” Such a plan would create more grievances than it would remedy. With regard to dock clerks, the plan he recommended, of paying the men up to the day of settlement, would obviate in a great measure the necessity for them.

The CHAIRMAN, in closing the discussion, remarked that his experience, as a seaman in both branches of the service—the mercantile marine and the Royal navy—extended over a period of fifty-five years, and having himself to act as a medical man for upwards of fifty years, he believed he knew more of actual scurvy than probably any surgeon in the service. On starting for the coast of Africa, he did so with the determination if possible, not to lose a single man, and after serving there for three years and a-half he brought back every man alive. In the first year on the coast of Africa the whole of the crew, including the black men, were attacked with scurvy. The provisions were of the best quality, being duplicates of the stores supplied to Capt. Parry’s Arctic ships, including essence of malt and hops, with which excellent beer could be brewed on board; and “Barolay and Perkins” was served out to the men every night. Both officers and men were attacked with scurvy, but the ship’s surgeon knew nothing of the disease, having never seen it before. His (the Chairman’s) own opinion was that the disease was produced by the men sitting on wet seats. He got rid of the Africans from his crew; returned home; shipped a fresh crew and went out again, taking care to carry out with him the means of giving the men dry seats. At night the crew was mustered in dry clothes; a pint of beer was served out to each man; and there was no case of sickness whatever during the next two years and a-half. He had always found that the officers seldom suffered from scurvy, and that in whalers the disease never made its appearance till the ships reached the fishing grounds. He had served in all parts of the world, and had never lost a man from scurvy contracted at sea. Two died of it, but then the scurvy was in their system before they left England. With regard to limejuice, he found it had no effect on the men, but all the cures were effected either by sulphuric acid or tartaric acid, when the men would not touch the limejuice. With regard to the funds arising from moneys paid by merchant seamen, it was laid down by the Commissioners of Patents that the money accumulated by patent fees was not considered to be the property of the Government, but was merely in trust; and he was satisfied the moment any institution was established to which the seamen’s fund could be satisfactorily applied, it would, as stated by a former President of the Board of Trade, be refunded. On the question of bad provisions supplied to ships at some of the outports, he had positive knowledge that vessels had sailed from Liverpool and other ports with provisions of very inferior quality. It struck him that a very simple way of guaranteeing the quality of the provisions was to procure those which had the mark of the best provision dealers; and when a cask of bad meat was opened on board ship it should be at once condemned, and an entry made in the log-book. The mate and carpenter, with some of the leading seamen, should decide as to the quality of the provisions, in which matter he had always found that they were better judges than the officers. He fully concurred in the observations of Captain Toynbee with respect to sulphuretted hydrogen arising from the cargo hold. He had known instances in which every article of silver in the ship was blackened by that gas; and in the Indian ships no vessel that had carried sugar was ever allowed to carry tea. He thought it would be a beneficial arrangement that before a vessel took her clearance

an official inspection should be made, with the view of ascertaining whether there was anything objectionable on board; and if objections or complaints were made by any of the crew, it was better to discharge them before sailing than to take mutinous elements out to sea. As regarded “homes” for married seamen, he did not see why a fund should not be accumulated for the purpose, to which married seamen should contribute, and a slight payment by each man would soon accomplish the object; these could be connected, if desirable, with the existing “homes.” He was sure they all felt indebted to Captain Toynbee for his valuable and interesting paper, and he hoped its influence would not cease in this room. He hoped this subject would be taken up in a way that would give merchant owners and captains an opportunity of bringing the matter effectively before the Government; and he further hoped that Government would grant a commission, so that the whole question might be thoroughly inquired into. The Chairman concluded by proposing a cordial vote of thanks to Captain Toynbee for his paper.

The vote of thanks having been passed, Captain TOYNBEE, in reply upon the discussion, said, in answer to Captain Hunter, that if seamen were in a satisfactory state, why did Mr. Graves, M.P. and shipowner, ask for a Royal Commission to inquire into the question, and why were sailors now showing an inclination to strike in all directions? With regard to foreigners, they might or might not be worse off in their own ships than British seamen, or they might be tempted by the better pay which enabled them to support themselves and families. This would perhaps explain the present large percentage of foreigners. In reference to the question of scurvy, vegetables were not given to seamen at sea before limejuice was issued by Act of Parliament, and it was in consequence of scurvy that this Act was passed; now scurvy was returning because sulphuric acid and such like substitutes were given instead of limejuice. Captain Hunter’s want of knowledge of the use of manglers only showed how much they were needed in the merchant service; they were required as well as the hawse-bags or canvas to which he had alluded. Mr. Jackson had pleaded for the shipowner, and said that if a sailor could not get a good ship in one port he should go to another. He had charged him (Captain Toynbee) with depreciating the Belvedere, but he had not intended to do so. On the contrary, he supported it warmly, and only wished others would do the same. Mr. Jackson had concluded by saying that there was mismanagement in the provisioning our army in the Crimea, from which he appeared to think we should not trouble ourselves about scurvy in the merchant service. Mr. Reddie, who, he believed, was Secretary of the Victoria Institute, had said that advance notes did good; this was contrary to experience. Monthly notes for wives and families did good, but advance notes induced sailors to waste the money of their last voyage, trusting to the advance note to fit them out for the next. Shipowners knew this thoroughly. He (Captain Toynbee) advised them to combine to stop this system, but, in order to show that it was not done for their own interest, to offer to pay the month’s advance into the pension fund if the sailor wished it. He complained that telling sailors their rights made them “sea lawyers,” but his (Captain Toynbee’s) definition of a “sea lawyer” was a man who was constantly wishing and arguing for something which was not due to him. Nothing tended to form this character so much as not clearly defining what a man’s rights were. Nothing checked it so thoroughly as telling a man distinctly his rights, giving him the opportunity to complain, but at the same time making him do his duty. The Chairman spoke of having had men suffering from an illness on the West Coast of Africa produced by long exposure in boats or wet seats, which he supposed to be scurvy, and had cured with sulphuric acid when limejuice was useless. He (Captain Toynbee) thought that this was some other disease, as to which the medical pro-

fession might well be inclined to ask further particulars. In conclusion, he might say that all he had asked for was the support of shipowners, and others interested in the welfare of our mercantile marine, in obtaining remedies for evils the existence of which was fully admitted. His suggestions did not involve large expense, and only interfered with that style of business which was carried on at a miserable saving, which was only obtained at the expense of the unfortunate seaman.

Admiral RYDER said he thought the best assistance this Society could afford would be by trying to induce Mr. Graves to renew his motion for a commission, which should have power to take evidence on oath. In this way some really reliable information might be arrived at, which no committee of this Society could possibly obtain. In his opinion this would be the most effective mode of action.

Proceedings of Institutions.

MACCLESFIELD USEFUL KNOWLEDGE SOCIETY AND SCHOOL OF ART.—The thirty-first anniversary of the Macclesfield Useful Knowledge Society, combining with it the annual meeting of the School of Art, was held on the 8th of November last; E. C. Egerton, Esq., M.P., one of the vice-presidents of the Society, in the chair. In front of the platform were exhibited a variety of drawings, the productions of the male and female students of the School of Art. A letter was read from the President, Mr. John Brocklehurst, M.P., regretting his inability to be present, but adding that as he hears that a great want of room, especially for the classes, is felt to be acting prejudicially to the interests of the institution, he has "much pleasure in placing a sum of £500 at the Committee's disposal, towards providing the requisite accommodation for the students, and removing what must otherwise prove a very serious drawback to the future prosperity of the institution." After an address by the Chairman, the Hon. Secretary, Mr. J. O. Nicholson, read the annual report for 1866, from which it appears that the list of members has suffered a very slight decrease; in 1865 it numbered 504, now 499; this number being composed as follows:—honorary 168, ordinary 226, females 50, and juniors 62. 193 students (81 senior, 62 junior, and 50 female) are now in attendance on the classes; the fees from this number if paid regularly would be £72 4s. per annum, whilst (without taking into account the due share of the other expenses of the Institute, such as rent, taxes, &c.) the salaries paid to teachers amount to £73 16s.; showing the charitable nature of the educational work performed by the society. According to lately collected statistics the pupils of the society number two-fifths of the whole receiving night-school education in the town. The classes are as follows:—Senior.—Arithmetic (average attendance) 29; reading, writing, and dictation, 29; grammar, 13; history and geography, 20; French, 10; phonography, 13; lecture class, 77. Female.—General instruction, 23; sewing, 13. Junior.—General instruction, 49. The students during the past year have been submitted to examinations instituted by the Lancashire and Cheshire Union of Institutes; the Society of Arts; the Department of Science and Art; and the Local Committee. The results were very favourable. The science classes of last Session had not the successful termination which the committee desired to see. This was owing to the removal from the town of the teacher before the conclusion of the series of lectures, and the consequent almost non-attendance of the pupils at the Science Examination. A series of lectures upon scientific subjects was in course of delivery by Mr. Greg. The lectures have been confined to ordinary members, and the average attendance has been 77. The phonographic class has made much progress during the year, several of the pupils being able to write at the rate of 70 words a minute. It has been computed that since the establish-

ment of the female class in 1852, 900 pupils have there received instruction. Monthly readings of an interesting character have been given to this class. During the year there has been an issue of 9,760 volumes from the society's library, 2,317 from Mudie's, and 1,190 from the London Library Company, a total of 13,267. The supply from Mudie's is nearly 80 volumes, exchanged about every two months; that from the London Company 100 volumes, exchanged quarterly. The library now possesses more than 5,000 volumes; it has only had added to it 32 volumes during the year. The appeal made last year to the members on behalf of a fund for securing telegraphic information resulted in promises of subscriptions amounting to £10. The committee then decided to incur the extra expense, but upon application to the Electric Telegraph Company were informed that they were not in a position to forward telegrams of such a character and extent to Macclesfield. During the year two lectures and an entertainment have been given on the society's behalf, Mr. Councillor David Morris, F.S.A., lectured upon "Lancashire Poets and Poetry;" J. D. Sainter, Esq., gave a lecture upon the Natural History, &c., of Dances Moss, near Macclesfield; and a musical and dramatic entertainment was sustained by Captain Lathbury and Messrs. Smith and Gregory. A new catalogue of the library has been prepared. In February last Mr. David Chadwick placed at the disposal of the committee fifty guineas for prizes for essays, the essayists to be, or to have been, inhabitants of Macclesfield, and the subjects to be—1st, "Macclesfield Past;" 2nd, "Macclesfield Present and Future." Two prizes to be awarded in each subject; 1st prize, 20 guineas; 2nd prize, 5 guineas. Samuel Greg, Esq., John May, Esq., and Dr. Watts acted as referees. Six competitors sent in Essays, and the prizes were awarded as follows:—"Macclesfield Past."—1st prize, 20 guineas, to John Wootton; 2nd prize, 5 guineas, to J. O. Nicholson. "Macclesfield Present and Future."—1st prize, 20 guineas, to J. S. Barrett; 2nd prize, 5 guineas, to J. O. Nicholson. Through the further liberality of Mr. Chadwick, the sum of six guineas was distributed among the three unsuccessful competitors. The financial statement of the year is as follows:—Receipts, £350 9s. 7d.; disbursements, £494 3s.; balance due to treasurer, £143 13s. 5d.—The Rev. W. R. B. Arthy moved the first resolution to the effect that the report be adopted; and also recognising the fact that a valuable primary education is being given to nearly 200 scholars at this Institute for the nominal fees of 2d. per week for males, and 1½d. per week for females. Mr. Greg seconded the resolution, which was passed. The Hon. Secretary then read the annual report of the School of Art, in which the writer gives his opinion as to the effect on art instruction of the recent change of system pursued in all schools, introduced by the Department of Science and Art, on the recommendation of the Select Committee of the House of Commons, which sat in 1864. Four points of comparison (says the reporter) between the present and past systems will suffice to sum up the most important features, and which may be briefly contrasted thus:—*Past System.*—1st. Government assistance to schools by fixed salaries to masters, as in my predecessor's case—or by payment on certificates, as in my case—and in both cases additional payment on results of examination of artisan students and artisans' drawings.—2nd. Compulsory connection of schools of art with parochial schools, and division of payment on results of drawing examinations in parochial schools.—3rd. Prescribed competitive works.—4th. Addition of books and art works to property of art schools on success of students' drawings. The Macclesfield School having obtained art property of the value of £321 10s. since its commencement. *Present System.*—1st. Abolition of fixed salaries and certificate money, and substitution of increased payment on results.—2nd. Sovereignty of parochial schools, and consequent entire payment to their

committees. During last year, the first since the severance, there was a total decrease of 5,000 receiving instruction in drawing in parochial schools throughout the United Kingdom.—3rd. Freedom of selection of competitive examples.—4th. Discontinuance of all awards of property to schools of art. It will be seen from these few facts (says the reporter) that Government support to schools of art has decreased on every hand; and that the change of system has been most prejudicial to the numbers taught drawing in parochial schools; but, by the abolition of restricted examples, masters will be able to devote more attention to local trades than hitherto. The grand total taught in and through the agency of this school since its commencement in 1851 to Sept. 1866, has been 8,000, divided as follows—Central school, 1;—Ladies' morning class, 80; general evening class, 718; private schools, 304; and parochial schools, 6,898. During this period 26 national medallions or Queen's prizes, 134 medals, and 149 second or highest grade prizes were gained by the students of the morning and evening classes, and 623 first or lowest grade prizes, by pupils of the parochial schools. The medallions and medals gaining £321 10s. worth of books and art examples, the property of the school, making altogether more than £1,500 worth of art works in the school for the study of this town. The number of students who received instruction in the school during the year which terminated on 30th September, 1866, is as follows:—Ladies' morning classes, 20; general evening classes, 78; total, 98. In addition, 614 pupils were instructed in private and other schools, making the total number of all classes who received instruction in and through the agency of this school, 712. At the annual examination held in March, 1866, 166 pupils were successful, passing in such subjects as free-hand drawing, geometry, perspective, and model drawing—gaining colour boxes, drawing boards, T squares, certificates, and cards. Also eleven drawings were sent to London by the students of this school, in competition with other schools, and the whole were successful, obtaining medals, books, &c. In conclusion the reporter states that nine young men—who received their early art education in this school—have obtained excellent situations; five gaining admission to the National Art Training School, London, and receiving salaries, two of whom have become masters of schools of art, two ornamental glass designers, and one at present in training. Also two as silk designers, one as architect, and one as sculptor.—Mr. Henry Brookelhurst moved the adoption of the report, which was seconded by Mr. W. Bullock, and carried. The meeting concluded with the usual votes of thanks.

PARIS EXHIBITION, 1867.

Her Majesty's Commissioners, with the Associate Commissioners, held meetings on Friday, the 11th inst., at the South Kensington Museum. His Royal Highness the Prince of Wales presided over both meetings. There were also present the following:—

His Royal Highness the Duke of Edinburgh, K.G., the Duke of Buckingham and Chandos, the Duke of Sutherland, K.G., the Duke of Cleveland, K.G., the Earl of Clarendon, K.G., the Earl De Grey and Ripon, Earl Granville, K.G., Lord Henry Lennox, Lord Talbot de Malahide, Lord Houghton, Right Hon. Sir J. S. Pakington, Right Hon. T. M. Gibson, M.P., Right Hon. C. B. Adderley, M.P., Right Hon. G. J. Goschen, M.P., Right Hon. H. T. L. Corry, M.P., Sir A. Y. Spearmen, Sir S. M. Peto, Sir R. I. Murchison, K.C.B., Sir F. R. Sandford, Sir Francis Grant, P.R.A., Mr. Edgar Bowring, C.B., the Right Hon. the Lord Mayor, Mr. Thomas Baring, M.P., Mr. Thomas Bazley, M.P., Mr. G. T. Clark, Mr. Charles Duffin, Mr. Thomas Fairbairn, Mr. Charles Forster, M.P., Mr. T. W. Jones, Mr. William Hawes, Mr. Lewis Heyman, Mr. A. J. B. Beresford Hope

Lawson, Mr. P. W. S. Miles, Mr. R. Redgrave, R.A., Lieutenant-General Sabine, R.A., Mr. W. Scholefield, M.P., Mr. W. Warington Smyth, Mr. Frederick Taylor, Mr. Henry Thring, Mr. Henry Warren, Lord G. Fitzgerald, Hon. Ashley Ponsonby, Viscount Torrington, the Earl of Warwick, the Earl of Cadogan, Hon. R. Curzon, Hon. Seymour Egerton, M'Leod of M'Leod, Archbishop Manning, Lord R. Montagu, the Very Rev. Dr. Rock, the Duke of St. Albans, Sir Harry Verney, the Duke of Wellington, K.G., Hon. Reginald S. West, Lord Wharnclyffe, Sir Watkin W. Wynn, Bart., the Earl of Cork, Mr. H. E. Acton, Mr. Patrick Adie, Mr. J. V. Appell, Mr. C. Asprey, Mr. A. Barker, Mr. J. Barnes, Mr. C. Barnett, Rev. J. Beck, Mr. Thomas Begges, Captain Belfield, R.E., Mr. T. Bell, Professor Sterndale Bennett, Professor Bentley, Rev. M. J. Berkeley, Mr. James Betts, Mr. Samuel Bevington, Mr. Daniel Biddle, Mr. W. Bird, Mr. C. C. Black, Mr. S. H. Blackwell, Mr. G. E. Blenkins, Mr. H. A. Bowler, Colonel Boxer, R.A., Mr. J. Brinton, Rev. W. H. Brookfield, Mr. George Brown, Mr. J. Buchanan, Mr. F. T. Buckland, Mr. W. Bull, Mr. W. W. Buller, Mr. A. Peel, Mr. J. Pinder, Mr. J. Penn, Mr. H. Cholmondeley Pennell, Mr. J. Peters, Captain Phillimore, Mr. W. H. Phillips, Mr. C. A. Pierce, Mr. J. H. Pollen, Mr. E. G. Poole, Mr. Norbury Pott, Mr. F. S. Powell, M.P., Mr. Nathaniel Powell, Mr. W. Priestly, Mr. A. Puckridge, Dr. Quain, Dr. Quin, Mr. G. Ramsey, Mr. Samuel Redgrave, Mr. G. Redmayne, Mr. T. J. Reed, Mr. James Reiss, Mr. T. Reeks, Mr. Westley Richards, Mr. Eugene Rimmel, Mr. J. H. Ritchie, Mr. J. C. Robinson, Rev. W. Rogers, Rear-Admiral Ryde, R.N., Major-General St. George, R.A., C.B., Mr. Alderman Salomons, Mr. Titus Salt, Mr. S. J. Salter, Mr. J. D. A. Samuda, M.P., Mr. W. Sangster, Mr. E. Sayer, Commander Scott, R.N., Sir J. P. K. Shuttleworth, Bart., Mr. S. W. Silver, Mr. W. B. Simpson, Mr. R. H. Smith, Dr. E. Smith, Mr. J. J. Smith, Mr. W. Baxter Smith, Mr. W. H. Smith, Mr. T. Sopwith, Mr. W. R. Spicer, Mr. H. Stuart, Mr. G. R. Stephenson, Mr. M. H. Sutton, Mr. S. Sidney, Mr. J. Taplin, Mr. Thomas Taylor, Professor Wyvil Thompson, Mr. A. J. R. Trendell, Colonel Sir Thomas Troubridge, C.B., Mr. C. Turner, Mr. F. Turner, Mr. R. S. Turner, Professor Tyndall, Mr. J. Unite, Mr. G. F. Urling, Mr. H. Vaughan, Mr. J. Veitch, Professor Voelker, Dr. E. J. Waring, Captain Warlow, R.A., Mr. Alderman Waterlow, Mr. Anthony Waterer, Mr. J. Watts, Major-General Sir A. Scott Waugh, R.E., Mr. H. P. Way, Mr. J. Weeks, Mr. H. Weir, Mr. F. West, Professor Wheatstone, Mr. T. M. Whitehead, Mr. J. Whitwell, Mr. G. F. Wilson, Dr. Woolley, Mr. J. Whitworth, Mr. C. Woollerton, Mr. M. Digby Wyatt, and Mr. C. Wyld.

Mr. Henry Cole, C.B., the secretary to her Majesty's Commissioners, attended.

His Royal Highness the Prince of Wales read the following memorandum on the prospects of the Exhibition:—

"1. Her Majesty's Commissioners thank the Associate Commissioners for the suggestions they have made in recommending jurors. They also thank the several committees of the Associate Commissioners who have frequently met in order to insure a proper representation of objects of ancient art, modern pictures, engravings, various manufactures, printing, navigation, munitions of war, &c.

"2. Her Majesty's Commissioners thank the Trustees of the British Museum, as well as those of other public institutions, for the readiness with which they have consented to lend objects necessary for completing the Exhibition at Paris.

"3. It has not been found necessary to ask for the services of the Associate Commissioners in several classes, because the demands for space in those classes have greatly exceeded the amount that could be granted; and in respect of the classes for agricultural stock, action has been suspended by the Imperial Commission in consequence of the cattle plague.

"4. A statement of the representation which each class appears likely to make in the Exhibition will be laid before the Associate Commissioners, and her Majesty's Commissioners will be glad to receive their assistance in supplying some few deficiencies.

"5. Her Majesty's Commissioners regret that the staple industry of cutlery, for which England is remarkable, should at present appear to be most imperfectly represented; it may be hoped that by the co-operation of the Associate Commissioners and the Master Cutler of Sheffield an adequate representation of that important branch of industry may be effected.

"6. Notwithstanding this deficiency, her Majesty's Commissioners have the gratification of believing that in other respects, the United Kingdom, India, and the colonies will be far more completely represented than in any previous International Exhibition.

"7. A new and very important inquiry—namely, the effect on workmen of co-operation and benevolent associations throughout Europe—has been originated by

the offer of prizes by the Imperial Commission.* Each Associate Commissioner has been sent a copy of the series of questions which it is desirable should be answered by persons or establishments in this country, and the Associate Commissioners will much promote this inquiry if they will assist in causing these questions to be filled up as extensively and as soon as possible.

"8. It is the earnest wish of Her Majesty's Commissioners that the example set by the French in 1862 of assisting foremen of works and artisans to study the Exhibition should be followed, and that the utmost facilities should be afforded to British workmen to visit and study the Paris Exhibition. Her Majesty's Commissioners express a hope that the Associate Commissioners will, in concert with the Society of Arts, municipal authorities, and Chambers of Commerce throughout the country, be able to assist materially in promoting such visits.

"9. The Executive Department of the British section has provided offices for the transaction of business at 71, Avenue des Champs Elysées, Paris, where the Associate Commissioners will be able to obtain information respecting the Exhibition, and facilities for visiting it."

The following were the subjects discussed at the meeting of the Commissioners:—

The list of proposals for jurors, and the measures necessary for nominating them, also the appointment of associate jurors and delegates, for which purpose a committee, representing the various groups, was appointed to select the jurors.

The Commissioners next considered a memorandum on the prospects of the Exhibition, which his Royal Highness the President read to them, and adopted it after a discussion on the paragraph relating to the new order of reward, in which the Lord President of the Council, Earl Granville, the Duke of Cleveland, the Earl of Clarendon, Lord Houghton, Mr. Baileys, M.P., Mr. Beresford Hope, M.P., and Mr. Clark, of Merthyr Tydvil, took part.

A letter from the Society of Arts was read on the steps necessary to be taken to promote the study of the Exhibition and industrial establishments in France by artisans.

After reading a correspondence with the India-office on the representation of Indian architecture, it was resolved to appoint a committee of advice on this subject.

His Royal Highness the Duke of Cambridge, the Secretary of State for War, the First Lord of the Admiralty, and Mr. Robert Napier, late President of the Society of Mechanical Engineers, were elected Commissioners.

The Commissioners then proceeded to meet the Associate Commissioners, when his Royal Highness the President read the above announcement agreed upon by her Majesty's Commissioners.

The following report on the approximate number of exhibitors, and the articles not represented, or insufficiently represented in each class, was also laid before the Associate Commissioners:—

"Where specified objects are named (as cameos in Class 8, globes in Class 13) there is at present no evidence that they will be adequately represented in the Exhibition, and where there are no numbers of exhibitors specified there are no exhibitors.

"CLASS 6. Typography.—39 exhibitors.

"7. Paper.—48 exhibitors.

"8. Drawing and modelling in common arts.—23 exhibitors. Cameos.

"9. Photography.—102 exhibitors.

"10. Music.—24 exhibitors.

"11. Musical instruments, &c.—29 exhibitors.

* The words of the Imperial Commission are as follows:—A distinct order of reward "instituted in favour of persons, establishments, or localities, which by a special organisation or special institutions have developed a spirit of harmony among all those co-operating in the same work, and have provided for the material, moral, and intellectual well-being of the workmen."

"12. Mathematical instruments.—27 exhibitors. Measures and weights of the various countries.

"13. Maps, &c.—6 exhibitors. Terrestrial and celestial globes and spheres.

"14. Fancy furniture.—42 exhibitors.

"15. Upholstery.—29 exhibitors.

"16. Glass.—27 exhibitors.

"17. Porcelain, &c.—13 exhibitors. Biscuit. Terra cotta.

"18. Carpets.—23 exhibitors. Furniture stuffs of cotton, wool, or silk, plain or figured.

"19. Paper hangings.—10 exhibitors. Blinds, painted or printed.

"20. Cutlery.—7 exhibitors. (Poorly represented.)

"21 and 36. Plate and jewelry.—31 exhibitors.

"22. Bronze castings, &c.—2 exhibitors. (Poorly represented.)

"23. Clocks, &c.—32 exhibitors.

"24. Heating, &c., apparatus.

"25. Perfumery.—15 exhibitors.

"26. Leather fancy goods.—39 exhibitors.

"27. Cotton.—29 exhibitors.

"28. Flax and hemp.—17 exhibitors.

"29. Wool, combed.—9 exhibitors.

"30. Wool, carded.—107 exhibitors.

"31. Silk.—30 exhibitors.

"32. Shawls.—4 exhibitors. (Poorly represented.)

"33. Lace, &c.—31 exhibitors.

"34. Hosiery.—14 exhibitors. Baby linen, fans, screens.

"35. Clothing.—42 exhibitors. Clothing peculiar to various professions and trades.

"36. Jewelry.—See 21 class.

"37. Portable weapons.—16 exhibitors. (Exceptional case.)

"38. Travelling apparatus, and campequage.—12 exhibitors. Portable apparatus specially intended for scientific voyages and expeditions, photographic apparatus, instruments for astronomical and meteorological observations, equipment and implements for geologists, mineralogists, &c.

"39. Toys.—6 exhibitors. For toys and games (except cricket) but one exhibitor.

"40. Mining.—123 exhibitors.

"41. Products obtained from forests.—7 exhibitors. (Imperfectly represented.)

"42. Products of fishing and uncultivated fruits.—1 exhibitor. (Only gums and turpentine represented.)

"43. Agricultural products (not food).—11 exhibitors. Cocoons of the silkworm, tobacco, German tinder, tanning and dyeing substances. (Poorly represented.)

"44. Chemical products.—96 exhibitors.

"45. Chemical processes. Dyeing, &c.—4 exhibitors. (Poorly represented.)

"46. Leather.—22 exhibitors. Parchment, gutwork, strings for musical instruments.

"47. Apparatus in mining.—16 exhibitors. Models and plans of workings in mines and quarries, mining ladders, drainage machines, apparatus for saving life, parachutes, signals, apparatus for carbonization of fuel, smelting furnaces, smoke consumers, metal work apparatus, apparatus for forges, &c.

"48 and 74. Apparatus in cultivation.—58 exhibitors. Plans and models of farm buildings, plans of systems of re-planting and cultivating forests, and apparatus used for cultivating the same.

"49. Apparatus for fishing, and uncultivated products.—6 exhibitors. Guns and shooting apparatus and equipment, apparatus and implements used in gathering products obtained without cultivation.

"50. Apparatus for agricultural works.—31 exhibitors. Apparatus used in manufacture of artificial manures.

"51. Apparatus for chemistry.—10 exhibitors. Apparatus used in assays, in the manufacture of chemicals, soaps, candles, essences, varnishes, and articles in india-rubber, &c., bleaching pharmaceutical products, glass works, and ceramic manufactures.

"52. Engines, &c.—24 exhibitors. Shafts, rails, and turn-tables.

"53. Machines.—45 exhibitors. Machines set in motion by evaporation of ether, ditto by gas, &c., wind-mills, panemones, air balloons.

"54. Machine tools.—22 exhibitors.

"55. Apparatus for spinning.—16 exhibitors. Materials used in rope manufacture, round, flat, tapering cables, cord and twine wire rope, &c.

"56. Apparatus for weaving.—16 exhibitors. Apparatus used for making lace.

"57. Apparatus for sewing.—13 exhibitors.

"58. Apparatus for making furniture.—1 exhibitor. (Almost entirely unrepresented.)

"Apparatus for paper-making, &c.—9 exhibitors. Apparatus for bleaching and dyeing, materials, apparatus and products of type-founding, machines and apparatus used in typography, &c., printing postage-stamps, machines for setting up and sorting type.

"60. Small machines.—4 exhibitors. Coining presses, tools for and processes of making clockwork, toys, &c.

"61. Carriages.—45 exhibitors. Waggons, tumblers, drays, and vehicles for special purposes, sledges, velocipedes.

"62. Harness.—21 exhibitors.

"63. Railway apparatus.—18 exhibitors.

"64. Telegraphy.—4 exhibitors. (Barely represented.)

"65. Engineering.

"66. Navigation and lifeboats.

"67. Cereals, &c., for food.—6 exhibitors. Fecula from potatoes, rice, lentils, &c. Gluten, tapioca, Italian pastes, &c., alimentary preparations as substitutes for bread, &c.

"68. Bread and pastry.—3 exhibitors. (Only represented by biscuits.)

"69. Fatty food.

"70. Meat and fish.—8 exhibitors. (Barely represented.)

"71. Vegetables and fruit.—1 exhibitor. Fresh fruit.

"72. Condiments.—20 exhibitors.

"73. Drinks.—16 exhibitors.

"74 with 48.—Farm buildings.

"75. Horses.—4 exhibitors. Animals as specimens of breed of country.

"76. Bulls, &c.

"77. Sheep, &c.

"78. Pigs.

"79. Poultry.

"80. Dogs.

"81. Insects.—4 exhibitors. (Represented.)

"82. Fish.

"83. Hothouses, &c.

"84. Flowers.

"85. Vegetables.

"86. Fruit trees.

"87. Seeds.

"88. Hothouse plant.

"89. Instruction to children.—34 exhibitors.

"90. Libraries, &c.—1 exhibitor. (Only represented by reading books for adult schools.)

"91. Cheap furniture.—7 exhibitors. (Represented.)

"92. Clothing of countries.

"93. Cheap dwellings.

"94. Skilled workers' work.

"95. Skilled workmen's instruments."

METROPOLITAN AND PROVINCIAL WORKING CLASSES' INDUSTRIAL EXHIBITION.

The ceremony of presenting the prizes to the successful competitors at this exhibition, which was held in the Agricultural Hall, Islington, in the months of September and October last, was performed on Saturday afternoon, the 12th instant, in the large room of Exeter-hall.

The Right Hon. Mr. J. G. GOSCHEN, M.P., took the chair. From the report of the Council, which had been printed for circulation amongst the exhibitors, it ap-

peared that during the ten weeks the exhibition was open 599,248 persons entered the building, of whom 530,797 paid for admission. The number of persons who entered the building during the first week was nearly 55,000, which increased to 84,000 in the second week. During the third week, owing to the inclement weather, the number declined to 74,000; but in the week following it rose to nearly 89,000, the highest number in one day being 25,240 (Sept. 24). From this point the attendance gradually declined, although on no occasion were there less than 3,000 visitors in a day. The total amount of money paid for admission at the doors was £4,664 7s. 10d.; from sale of tickets, £60 17s.; reserved seats, £177 5s. 6d.; sale of catalogues and programmes, £216 2s. 7d.; receipts from other sources, including rent of stalls, £300; making a total of £5,400. Of the expenditure the rent absorbed £1,066; gas, £662; wages, £886; printing, £473; advertising, £120; bill-posting, £110; decoration and fitting-up, £378; machinery, £100; police, £90; music, £250; other expenses, £400.—Total, £4,630, leaving a balance in favour of the executive, for disposal, of £870. The gross number of exhibitors was 1,492, and the awards of prizes by the adjudicators consisted of 85 silver medals, 187 bronze medals, and 189 certificates of honourable mention, making a total of 461. In addition to these, there were a number of special prizes amounting in value to £57.

The CHAIRMAN, after delivering an address, distributed the prizes. The first special prize, £10, the gift of the Agricultural Hall Company, was presented to H. A. Major, a letter-carrier, for the best painting in oil. The prize of £15, offered by the same company for the most useful invention, was divided among three competitors, who had exhibited respectively a decimal key, a model of railway signals, and a boat-lowering apparatus. A silver cup, given by Messrs. Howard, of Bedford, was won by A. M. Franklin, of that place, who exhibited a model plough. Miss Alice Hazelden, aged 17, was presented with £5, the gift of Mr. J. Harris, for the best water-colour drawing. Mr. W. A. Latta, a compositor, received a prize of £2 2s., the gift of Mr. J. E. Wilson, for the best specimen of ornamental typography. Miss Ellen M. Hammond, governess, was presented with a prize of two guineas for the best specimen of fancy needlework. After the special prizes, the silver medals, 85 in number, were presented; next the bronze ones, of which there were 187; and then the certificates of honourable mention, 189 in number. The distribution of the pictures of the exhibition followed.

Mr. BERSFORD HOPE then spoke for some time on the subject of the art bearing and relations to art of these exhibitions.

On the motion of the Rev. HENRY SOLLY, seconded by Mr. HOLMES, a cordial vote of thanks was awarded to the Chairman, and duly acknowledged.

CULTIVATION OF COTTON IN THE BOMBAY PRESIDENCY.

Mr. W. Walton, in charge of the office of Cotton Commissioner, has recently submitted to the Bombay government the annual report on the distribution of cotton seed by this department for the sowing season of the year 1866. Accompanying the report was a statement showing in complete detail the quantities and descriptions of seed that have been issued, and the places to which it has been sent. The list shows also 30 recipients of seed against 32 of the preceding year. Mr. Walton remarks that it will be observed, however, that in 1866 only "Dharwar acclimatised New Orleans seed" was supplied, whilst in the year under review cotton seed of no less than nine descriptions—exotic, indigenous, and acclimatised—were issued to requisitionists from almost all parts of India.

From the report it appears that upwards of seven and a-half tons of New Orleans seed have been distributed;

the supply, however, by no means gives any idea of the demand. "If I could have got it in time," says the Commissioner, "I could have issued upwards of two hundred tons: the demand was unprecedentedly large, but unfortunately the Cotton Supply Association could only send out the limited supply that has been issued. The greater part of the seed distributed has been issued in the Dharwar districts, where the cultivation of New Orleans cotton has taken so firm a hold as to have become one of the most important of the regular products of the country. Unfortunately, the seed of this class of cotton grown in the sallah has now got a considerable admixture of indigenous cotton seed; the large distribution of fresh American seed that has taken place this year, together with the careful and comprehensive arrangements that were made for sowing pure acclimatised seed, will, it is confidently expected, make a marked improvement in the season's crop." From a correspondence between the Commissioner and Dr. Henderson, the secretary of the Agri-Horticultural Society at Lahore, it appears that New Orleans cotton has been grown in the Punjab for many years. Dr. Henderson observes:—"Four years ago I brought to notice a fact not generally known, and which is still hardly believed here, viz., that New Orleans cotton has been grown in the Punjab, in the district of Shapoor, for fifty years at least, and is as good as any I have seen from imported seed. Three years ago I offered to supply it in any quantity, but the Financial Commissioner had then ordered a supply of imported seed. The zemindars only grew the cotton for home use, as they get the same price for good as for bad cotton." It would seem to be worth inquiring whether this cotton has deteriorated much or not, as if it at all approaches the quality of Dharwar acclimatised New Orleans cotton, it will be infinitely more profitable to the people of the Punjab to cultivate and send it to Kurrachee for shipment, instead of the comparatively worthless stuff that now annually comes down the Indus in such large quantities. Dr. Henderson's last observation seems to call for remark. It must be a strange state of trade which gives the same price for bad as for good staple. If there are zemindars in the Punjab willing to raise superior cotton, there are doubtless merchants in Kurrachee, if not in the Punjab, perfectly ready to give the enhanced price that their produce should get for its superiority over the indigenous cotton of the country. The importance of the matter has received the attention of the Punjab government. They took up the subject in the previous year, and distributed nearly 200 maunds of Dharwar acclimatised New Orleans seed.

Of Dharwar New Orleans seed upwards of twenty and a-half tons have been distributed during the season under review, against over thirty-nine tons in the preceding year. This fall-off is mainly accounted for by the fact that in 1866 the North-West Provinces and the Nuggur division of Mysore got the very large supplies of 1,062 and 1,618 maunds respectively. The produce from such large supplies would, it might have been expected, have been sufficient to meet any demand that could arise in those districts for this description of seed. Such, however, is not the case. Dharwar American cotton has apparently been so successful in the North-West Provinces that a further supply of 20 tons was called for this year. This supply was carefully selected from the very best Dharwar seed, and the Commissioner trusts that the result will be that New Orleans cotton will permanently become a profitable and successful product of the North-West Provinces. The seed distributed in the Nuggur division of Mysore has been successful, and the produce bears comparison with the best Dharwar New Orleans cotton. The Nuggur division of Mysore adjoins the Dharwar sallah, and the introduction of the seed was all that was required. The cultivation has been largely established, and the Nuggur ryots now get large supplies of fresh seed from their neighbours of the Dharwar districts. In the Dharwar sallah ample arrangements have been made for sowing pure seed.

Of Peruvian exotic cotton eight cwt. have been distributed, the principal part of which goes to the Khandeish zillah and the Punch Mahals.

Very little of the Dharwar acclimatised Peruvian (only 8½ lbs.) has been distributed. Mr. Walton regrets this, as he states that he has personally tried exotic Peruvian cotton and the Dharwar acclimatised Peruvian seed, and the result is such as not to allow of a comparison. The plants that have germinated from the acclimatised seed are infinitely superior in every respect to those produced from the imported exotic.

Upwards of a ton and a-half of Egyptian exotic cotton seed have been issued; the greater part of this has been sent to the Hon. Rustomjee Jamsetjee Jejeebhoy for planting on a very extensive estate belonging to that gentleman in the Goa territory, where the experiments are very extensive, and under the skilled supervision of a European gardener.

Of the Mysore acclimatised Egyptian seed a little over one and a-half hundredweights have been supplied. The greater part of this was also sent to Mr. Rustomjee, who will thus have the opportunity of having a fair trial between fresh exotic and partly acclimatised seed.

Of Sea Island cotton seed nearly two hundredweights were distributed. By far the greater part was sent to the collector of Khandeish. It would financially be a fortunate result if this cotton could be successfully acclimatised in any part of India, as its value is so very high. When New Orleans cotton is twenty pence a pound in the Manchester market, Sea Island is worth at least thirty-four pence per pound.

Of Berar indigenous cotton only twenty-five pounds were issued. This description has succeeded in the Khandeish zillah, and further experiments are advisable in those districts where the cotton indigenous to the country is inferior to the Berar variety.

The Dharwar indigenous cotton is a good variety of Indian cotton, and has a very fair name in the English market. A little over one hundredweight has been distributed, principally to districts where the local variety of cotton is inferior to the Dharwar indigenous.

During the year her Majesty's principal Secretary of State for India has sent out a practical gardener, Mr. Shearer, to assist in improving cotton. The Commissioner trusts that by next season Mr. Shearer will be sufficiently advanced in his knowledge of the country to actively undertake the special duties for which he has been appointed by government. Under the circumstances no departmental sowing operations have been carried on. Mr. Walton has, however, undertaken some private experiments, which he finds of considerable departmental benefit in showing the best way in which to undertake larger operations. He points out how, in his opinion, many experiments fail from condemnations being recorded on the results of imported exotic seed. Under the most favourable circumstances of importation, exotic cotton seed arrives in India with at least, on an average, 50 per cent. of the seed worthless. This is caused by the seed losing its germinating power whilst in transit. He believes many cotton experiments have been condemned on the very insufficient grounds of failure of exotic seed in places where different results would have been attained by trying seed that had become partially acclimatised to India.

The total amount of cotton supplied was as follows:—New Orleans American, 1866: 7 tons 10 cwt. 3 qrs. 23½ lbs. New Orleans Dharwar, 1866: 89 tons 0 cwt. 1 qr. 22½ lbs. New Orleans Dharwar, 1866: 20 tons 12 cwt. 1 qr. 17½ lbs. Peruvian Exotic, 1866: 6 cwt. 3½ lb. Peruvian Dharwar, 1866: 8 cwt. 1½ lb. Egyptian Exotic, 1866: 1 ton 12 cwt. 3 qrs. 14½ lb. Egyptian Mysore, 1866: 1 cwt. 2 qrs. 6½ lb. Sea Island Exotic, 1866: 1 cwt. 3 qrs. 26½ lbs. Berar Indigenous, 1866: 25½ lbs. Dharwar Indigenous, 1 cwt. 12½ lbs. Total, 1866: 39 tons 1 qr. 22½ lbs.; total, 1866: 30 tons 17 cwt. 24½ lbs.

In conclusion, the Commissioner observes that the year under review has been a most exceptional one

financial difficulties have been so great as to seriously discourage all improvements and extensions of cotton cultivation.

Manufactures.

GRANITE WORKING.—A new industry has lately been introduced into Glasgow—that of polishing granite, an art for which Aberdeen has long been noted. The works established near Pollockshields by the Scottish Granite Company are at present employed in the preparation of eight polished granite columns for the piers of Blackfriars-bridge. One cylinder now in course of preparation is about seven feet in diameter, and about eleven feet in length; and four of the number are to be about eight feet in diameter and twelve feet high. The material is the beautiful syenitic granite of Mull, which takes the finest possible polish.

STRENGTHENING THE MANHOLES OF BOILERS WITH MOUTHPIECES.—In one of the recent reports of the Chief Engineer to the Manchester Association, attention is drawn to this subject as follows:—"The importance of strengthening the manholes of boilers with mouthpieces is shown by the fact that nine explosions, by which fourteen persons have been killed and six others injured, have recently occurred to boilers in which this precaution has been omitted. In each of these explosions the primary rent has started from the manhole, and although in some cases the pressure of the steam has been considerably higher than it should have been, so that the explosions have been partly attributable to excessive pressure, yet they have been materially promoted by the weakening effect of the unguarded manholes, while others have been entirely due to that cause. The weakening effect of unguarded manholes is not produced solely by the amount of metal cut away, but to a great extent by the action of the covers. These are generally internal, and held up to their work by the pressure of steam as well as by a couple of stout bolts and nuts, suspended from arched bridges; and as the surfaces of the plates at the joint are not dressed smooth, but left rough, a considerable strain is frequently put on the bolts to make the joints steam-tight, especially when the cover does not fit the sweep of the boiler. Thus the action of the steam, combined with bolts, tends to force the cover through the manhole and split the boiler open. This is just the action that takes place. In some boilers it has been detected in an early stage, just in time to prevent explosion, while others have been known to burst shortly after the manhole covers have been tightened up, or the joints caulked. Nothing is easier than to strengthen these manholes, and this is done in all modern boilers turned out by first-class makers. The manhole mouth-piece recommended is an external one, made of cast-iron, and in the shape of a short cylinder, with a flange both at the top and bottom, the lower one being curved, so as to fit the sweep of the boiler to which it is riveted, while the upper one is flat, and fitted with a cover, secured with bolts and nuts. Both the cover and upper flange should be faced up true on their joint surfaces, while it adds a finish to the work to turn them up on their edge, as well as to face the cover on the outside for a width of about four inches, so as to give a true bearing surface for the nuts. For convenience in lifting the cover, a wrought-iron eye-bolt should be attached to it at the centre. The height of the mouth-piece should be sufficient to admit of the introduction of the bolts between the flanges for securing the cover, while the opening should be large enough to afford a man easy access—say fifteen inches—which, however, is a liberal allowance, and might be slightly reduced in special cases should it be desirable to do so. The metal should be an inch and a-quarter thick for steam at a pressure of 60 lbs., while the bolts should be an inch in diameter, and spaced about six

inches apart. It is well to strengthen the upper flange by brackets, while the cover can be stiffened by ribs if required. By some makers the flanges are made as much as an inch and a-half thick. For steam considerably above 60lbs. on the square inch, mouth-pieces are sometimes made of wrought-iron, but those of cast-iron are found to work satisfactorily up to that pressure. No hemp ring will be required for making the cover-joint, but merely a little red lead and oil if the surfaces be properly got up, and provided that the lower flange be suitably riveted to the shell, little or no caulking will be required to make it steam-tight. This external man-hole mouth-piece is not the only form adopted. Some boiler-makers prefer an internal one. Either of them if properly made works well. In double furnace boilers the mudhole—which is placed at the bottom of the front end plate, and below the furnace mouths—forms a second manhole, and should be guarded with a mouth-piece. When this is omitted, inconvenience is experienced from leakage at the joint, which not only disfigures the boiler but induces corrosion, in many cases so wasting that the front end plate has to be cut away and repaired. With good mouth-pieces, suitably got up, this danger is avoided. The mounting for mudholes is very similar to that recommended above for manholes, but the position below the furnace mouth does not allow room for a cylindrical mouth-piece sufficiently large to admit of a man's passing through it, and, therefore, instead of being cylindrical it has to be oval."

Commerce.

THE WOOL TRADE.—The imports of wool last year again show a considerable increase. During the eleven months ending November we have received from Australia about 3½ millions; from India, 8½ millions; and from other quarters 13 million lbs. more, but from the Cape 2½ million lbs. less than during the same period of 1865. In the exports there is a material falling off, both as regards colonial and foreign wools—Belgium alone having taken eight millions less; France, 3½ million lbs.; and the United States and other countries about six million lbs. less this year than during the previous one; but with respect to home-grown wool the contrary has been the case, the exports to France having been considerably in excess of former years. There is but a slight increase in the value of the exports of woollen manufactures. The quantity of wool taken for home consumption last year exceeded that of the preceding one by about 40 million lbs. The total imports of sheep's wool, in 1866, were 790,458 bales, and of goat's wool, 3,920 bales.

MINERAL PRODUCTS OF SPAIN.—Among the richest mines in Spain, the first that must be named are the quicksilver mines of Almaden, which, till the recent discovery of this metal in California, have almost exclusively supplied both Europe and America. The mineral districts of Almaden have already been worked by the Romans and by the Moors. Pliny has recorded two interesting facts: first, that the Greeks imported red cinnabar from Almaden 700 years before the Christian era; and 2nd, that Rome, in his time, annually received 700,000lbs. from the same mines. These mines are so extremely rich that, though they have been worked pretty constantly during so many centuries, they have hardly reached the depth of 330 yards. From 1820 to 1849 the average annual amount produced was 20,000 quintals, or 1,970 tons. At the present time the average annual product is about 1,500 tons, giving employment to from three to four thousand men. At the present time the yearly consumption of quicksilver does not exceed 31,000 quintals, about 3,100 tons, and is distributed in the following manner;—1,200 tons to Mexico, 1,000 tons to South America, and 900 tons to Europe. The mines of Almaden produce annually from

1,500 to 1,600 tons; those of California, 700 tons; Istria and Carniola, and other parts of Europe, 300 tons. The exportation of quicksilver from California is increasing every day, and the injurious competition made by that country in the American market with Spain threatens every day to become a monopoly. The mines of argentiferous lead are some of the most productive in Europe. Since the reform of the laws relating to mining in 1825 and 1849 the mines have been thrown open to foreign enterprise, and many mines have now been opened in the Gador and Luja mountains. In the province of Murcia more than 1,200 mines are being worked at the present time, and those that have been opened within the last few years in the Mount Almagrera are remarkable for the richness of the ore, the lead containing more than one per cent of silver. The mines of Vigen del Carmen, Observacion, Animas, La Esperanza, La Concepcion, La Estrella, and many others, are of great importance. The mines of La Carmen annually produce 20,700 tons of minerals; Las Animas produces 1,200 tons, the value of which may be estimated at six million reals, or £62,500. The annual production of the mines of La Estrella may be valued at 1,550,000 reals, or about £16,000. The other mines produce like quantities. Those of Linars, the property of the state, and worked by Government, are also deserving of notice. The number of workmen employed in the mines in the province of Murcia amounts to nearly 11,000, and they produce annually about forty millions of reals (£416,666.) The principal smelting works established at Carthagena employ more than 3,000 persons. The principal tin mines in Spain are those of Galicia and Asturia, and the production might be considerable. Zinc is also very abundant in the provinces of Guipuscoa and Santander, and might equally be worked to advantage. By encouraging railway undertakings, that tend to unite the principal coalfields to the general network of lines, the Government would be enabled to develop to an enormous extent the metallurgical resources of Spain. The low price of fuel is most necessary in order that the smelting establishments may be profitably worked; this condition once fulfilled, and the necessary communications established, the means of transport facilitated in every way, with a reduction to a moderate tariff, the Spanish mines will increase considerably in value.

Colonies.

COAL IN TASMANIA.—Coal exists in most parts of Tasmania. Until lately, Hobart Town was chiefly supplied from the mines of New Town, a distance of about three miles from the city, and from Tasman's Peninsula. But the Seymour Coal Mining Company now takes its share of the trade, and the mines of this company are on the eastern coast. From New Town and Tasman's Peninsula is obtained anthracite coal; from Port Seymour, bituminous. But it is generally believed that coal beds of far greater value than these exist in other parts of the island, and Mount Nicholas has long been pointed to as the site of one. Of this, the following notice appears in an account of the samples of coal furnished for the International Exhibition of 1862:—"The seam of coal which crops out at various points on the side of Mount Nicholas, locally known as the Killymoon Seam, is estimated to occupy an area of about 14 square miles. Various other portions of the bed are equally accessible, but although they are mostly bituminous, they are inferior in thickness to the Killymoon Seam. Beds in the Mersey River have also been found, and, although limited in quantity, have been profitably worked, as they are easy of access. The coal is very bituminous, is used by the coasting steamers and in Launceston, and has been exported to Victoria. The bituminous coal from Hamilton is said to be very good. It lies about 40 ft. deep, in a seam 4 ft. 6 in. thick, and has been used by the Derwent steamers, from

the shipping place of which, at New Norfolk, it is about 10 miles distant. The coal formation on the south side of the island extends round the mouth of the Huon to S.W. Cape, within which range many deposits have been discovered.

THE POST-OFFICE SAVINGS BANK SYSTEM AT VICTORIA has lasted a year, and the following statement shows what has been done:—Number of banks opened 44; number of accounts opened, 6,264; number of deposits received, 22,060; number of withdrawals paid 4,184; amount of deposits received £75,611 18s. 6d. amount of repayments, £28,604 3s. 10d.; balance to credit of depositors, £47,007 14s. 7d. The deposits during the past month that the system was in operation amounted to £4,105 5s., and during the last month they had increased to £11,660 9s.

THE REVENUE OF NEW SOUTH WALES during the year 1866 amounted to £2,027,267, of which the following are the most important items:—

Customs	£862,258
Duty on sugar and molasses	15,563
" spirits distilled in the colony	20,996
Gold revenue	26,591
Postage	78,000
Rents, exclusive of land	31,450
Stamps	71,000
Railway receipts	172,188
Telegraph	33,020
Land revenue	610,826
Licenses	76,670

The estimated revenue for 1867 is £2,223,505.

COTTON IN QUEENSLAND.—The success of cotton growing during 1865 has had the effect of forcing a larger quantity of land than in the previous year under that branch of cultivation. Those who have been growing cotton without exception have increased their operations, and there are numerous new growers. The present crop promises well. Should the season prove favourable throughout, cotton-growing is even expected to be the main crop of the colony, and to rank next to wool as a production. The large plantations on the seaboard are proving very successful.

PAUPERISM IN NEW SOUTH WALES.—A colonial paper says:—"In spite of the evidences of material prosperity of the colony of New South Wales, there is a great deal of pauperism in the country. There are large numbers of unemployed people in Sydney; and in the interior scores of men looking for work are to be met with on the tramp. This state of affairs is discouraging, but at the same time it must be remembered that this pauperism has been forced upon us, three-fourths of these vagrants having arrived from Queensland."

Obituary.

SIR STUART ALEXANDER DONALDSON died on Friday, the 11th instant, at Carleton Hall, Cumberland, the seat of his father-in-law, Mr. F. Cowper. Sir Stuart was the son of the late Mr. Stuart Donaldson, an eminent merchant of London, by the daughter of the late Mr. Cundale, of Snabgreen, Lancashire, and brother of the late Dr. Donaldson, of Cambridge, formerly head master of Bury St. Edmund's School, and a well-known classic and theologian. The deceased gentleman was born in 1812, married the daughter of Mr. F. Cowper in 1854, and for upwards of twenty years was head of the mercantile firm of Donaldson and Co., Sydney, New South Wales; from 1838 to 1859 he was a magistrate of New South Wales; was elected member of the council of that colony in 1848, and sat in the council and assembly till 1859. Sir Stuart formed the first ministry there responsible to Parliament, in April, 1856; was member and vice-president of the executive council, first minister and colonial secretary, subsequently colonial

treasurer, a commissioner of railways in 1857, and one of the original fellows of the senate of the University of Sydney, from its foundation in 1850. In 1855 he was appointed consul-general of Sardinia, and knighted by patent in 1860. He was elected a member of the Society of Arts in 1863.

Forthcoming Publications.

MINING AND METALLURGY OF GOLD AND SILVER. By J. Arthur Phillips. 8vo. (*E. and F. N. Spon.*)—This work will contain a description of the methods of occurrence of the above metals; geological characteristics of the principal gold and silver bearing districts, and notices of the most important mines; mechanical and metallurgical processes for treating gold and silver ores; machinery, apparatus, and appliances employed; assays of ores, and alloys of gold and silver; and annual yield of the principal gold and silver producing regions, &c.

Notes.

THE MUSEUM OF PRACTICAL GEOLOGY, Jermyn-street, was, for the first time, lighted up on Monday evening, the 14th inst., as well as on the three following evenings, until 10 o'clock; and the Committee of Council on Education have ordered that in future the Museum shall be open to the public on the evenings of every Monday and Saturday until 10 o'clock.

FIRST PINE-APPLES IN ENGLAND.—The following is from "Hardwicke's Science-Gossip":—"When Oliver Cromwell ruled in these realms, a present of pine-apples was one of the things which fell to his lot, and this was probably the first introduction of the fruit into England, although it was known on the Continent four years previously. Four years afterwards Evelyn writes of its appearance on the royal table. But the fruit, however much it may be extolled, is not the only good product of this plant. From the leaves thereof is procured a fibrous material, known and appreciated by the barbarous hordes of Africa and the semi-civilised Malays. The celebrated pine-apple cloth of the Philippines, resembling the finest muslin, is woven with the delicate fibres of the uncultivated pine-apple plant. This muslin is embroidered by the nuns of the convents of Manilla with excellent skill and taste, so that the "pina" muslin of the Philippines has become a celebrated article of manufacture. Mr. Bennett has observed in his 'Wanderings,' that one of the coarser fibres may be subdivided into filaments of such fineness as to be barely perceptible, and yet sufficiently strong for textile purposes."

INGENIOUS REGISTER OF A SHIP'S COURSE.—M. Corradi, an engineer of the "Compagnie de Navigation Mixte," of Marseilles, has invented a very ingenious apparatus, which he calls *loxodrographe*, and which may render great service for the exact indication of a ship's course. A roll of photographic paper is placed in the binnacle, and unwound by means of clockwork, following the centre line of the ship. This paper moves in a horizontal manner forward beneath the magnetic needle. The card bearing the points of the compass, in place of the star which usually indicates the north, is pierced with a small circular hole, above which is placed an object glass. The light admitted by this hole darkens the photographic paper underneath. If this paper were immovable the impression would be a circular spot, but as it is in movement a line is described by the action of the light on the sensitive salts with which it is impregnated. Thus placed it is easily understood that, the object-glass always remaining at the north, and the paper following the direction of the ship at each change of course, the black line will take a corresponding direc-

tion, and in this manner it is only necessary to examine it and a map of the ship's course is obtained. The advantage of this method will be easily conceived. Besides the indications that it furnishes with great exactitude, it requires no particular care, and an exact idea may be formed any moment of the angle formed by the ship with the meridian.

THE STANDARD PITCH OF MUNICH.—It is announced from Munich that in the orchestra of the Opera and the Chapel Royal the musical pitch of the Conservatoire of Paris has just been adopted, by command of the King.

Correspondence.

THE INDIA MUSEUM.—SIR,—With reference to the statement in Mr. P. L. Simmonds' paper, which appeared in last week's number of your *Journal*, to the effect that the India Museum is about to be transferred to South Kensington, I have to say that such is not the case, as provision has been made for it in the new India Office.—I am, &c., T. FORBES WATSON.
India Museum, Jan. 14, 1867.

MEETINGS FOR THE ENSUING WEEK.

Patents.

From Commissioners of Patents' Journal, January 11th.

GRANTS OF PROVISIONAL PROTECTION.

- Aniline colours, treating—3326—L. Schad.
Baling bands, fastenings for—3336—S. Wilson.
Blasting cartridges and fuses—3330—A. Rollason.
Bolts, securing the nuts of—3334—B. Bodmer.
Breech-loading fire-arms, and cartridge case extractors and cartridges for—3317—W. B. Mappin.
Cable stoppers—3319—J. Baker and J. Inray.
Carburettors—3308—W. Clark.
Cement—3398—J. Toussaint.
Centrifugal pumps—3336—M. Henry.
Clay, grinding—3378—H. Goodfellow.
Colouring matters—3195—C. E. Brooman.
Combustion of pulverulent substances—3344—W. E. Newton.
Compasses—2863—J. S. Gisborne.
Cotton gins—3342—G. B. Finch.
Electric currents, distributing—3298—J. P. Gillard.
Elevators—3314—A. V. Newton.
Engines, traction—2971—C. E. Brooman.
Explosive substances—3393—F. W. Reaves and J. B. Muschamp.
Fabrics, dressing, &c.—3285—F. B. Baker and L. Lindley.
Fabrics, elastic and ribbed—3350—S. Belfield.
Fatty bodies, preparing—3307—C. E. Brooman.

- Fibrous substances, treating—3109—W. Taylor.
Fibrous yarns or threads—3377—W. and J. W. Wood.
Fire-arms—3316—M. Weber.
Fire-arms, breech-loading—3302—D. Kirkwood.
Fire-arms, breech-loading—3318—W. Wood.
Fire-arms, breech-loading—3339—F. Hayman.
Fire-arms, breech-loading—3366—E. L. Martin.
Fire-arms, breech-loading—3362—J. S. Benson and J. von der Pöppelburg.
Furnaces—3297—J. Hasworth.
Gelatinous masses, treating—3303—J. W. Swan.
Grain, millstones for grinding—3384—W. E. Gedge.
Gunpowder—3310—G. A. Neumeyer.
Hammers—3297—S. Chaitwood and J. Sturgeon.
Heavy ordnance—3051—J. H. A. Gruson.
Horse rakes—3313—E. Howell and T. Hardy.
Hydrochloric and nitric acids—3269—I. Baggs.
Inkstands—3337—S. and J. J. Perry.
Knives, cleaning—3358—T. Hucksale.
Lead, &c., treating—3273—C. E. Brooman.
Liquids, filtering—3380—C. J. Wahab.
Locomotive machinery working without steam—3344—W. E. Gedge.
Machines—3161—W. E. Newton.
Madder—3366—H. A. Dufrenoy.
Metal tubes, cutting—3105—W. R. M. Thomson.
Moulding in green sand without patterns—3333—J. Goodfellow.
Mowing and reaping machines—3368—J. Howard.
Paint, unflammable—3327—W. R. Lake.
Paper—3299—G. Bertram.
Railway carriages, couplings for—3360—W. R. Lake.
Railways, vehicles to be used on—3271—J. Murphy.
Railway wheels—3145—W. Brookes.
Reaping and mowing machines—3220—F. W. Turner.
Screw valves—3372—W. Clark.
Sea sickness, preventing—3338—M. H. Simpson.
Sheep and cattle racks—3306—J. Symm.
Ships, coating the bottoms of—3348—S. Parry.
Shovels and spades—3316—G. Nimmo.
Size, preparing—3311—H. Hall.
Skates—3312—C. Mole.
Soundings, taking—3346—T. and T. F. Walker.
Steam boilers—3279—H. W. Ripley and T. Barker.
Steam motor—3288—A. V. Newton.
Steel to iron, welding—3304—W. E. Newton.
Stretch traps—3342—S. Buxton.
Steering apparatus—3321—J. McF. Gray.
Stops, cutting—2936—H. Hitchins and W. Wood.
Taps—3275—J. T. Kent.
Telegraph standards and insulators—3281—C. C. Adley.
Tobacco, receptacles for—3229—W. A. Richards.
Turbines—3320—F. N. Meisner.
Vessels of war—3362—T. Whitby.
Vessels, propelling—3233—C. E. Samuelson.
Vessels, propelling—3293—C. Randolph.
Vessels, propelling—3364—W. H. Harfield.
Wool carding—3322—W. E. Gedge.
Yarn, spinning—3328—A. V. Newton.

Journal of the Society of Arts.

FRIDAY, JANUARY 25, 1867.

Announcements by the Council.

ORDINARY MEETINGS.

Wednesday Evenings at Eight o'clock:—

JANUARY 30.—On this evening the Report from the Judges on the Art-Workmanship Competition will be read, and the competitors and their friends will be invited to be present. Sir THOMAS PHILLIPS, Q.C., Chairman of the Council, will preside.

FEBRUARY 6.—The following subject for discussion will be introduced by Mr. HENRY COLE, C.B.:—“On the existing legal regulations in reference to the Cab Fares in the Metropolis, and their effect in rendering the Vehicles inferior to those provided in other European Capitals and the large Municipal Towns of this Country.”

CANTOR LECTURES.

A course of Six Lectures “On Pottery and Porcelain,” illustrated by specimens of various manufactures, and by photographs and diagrams, is now being delivered by William Chaffers, Esq.

LECTURE II.—MONDAY, JANUARY 28.

MAJOLICA.—Italy, Spain, Persia, &c.

LECTURE III.—MONDAY, FEBRUARY 4.

FAYENCE.—France, Spain, Portugal, Russia, Sweden, Denmark, &c.

GRES OR STONE WARE of Germany and Flanders. DELFT WARE, &c.

LECTURE IV.—MONDAY, FEBRUARY 11.

ORIENTAL PORCELAIN.—China, Japan.

LECTURE V.—MONDAY, FEBRUARY 18.

EUROPEAN PORCELAIN.—Italy, Germany, France, Holland, Belgium, Russia, Poland, &c.

LECTURE VI.—MONDAY, FEBRUARY 25.

ENGLISH POTTERY AND PORCELAIN.—Early History, continued to the beginning of the 19th century.

The lectures commence each evening at eight o'clock, and are open to members, each of whom has the privilege of introducing one friend to each lecture. Tickets for this purpose have been issued to each member.

ART-WORKMANSHIP PRIZES.

The works sent in competition for these Prizes are now placed in the Society's Great Room for the inspection of members and their friends.

SUBSCRIPTIONS.

The Christmas subscriptions are due, and should be forwarded by cheque or Post-office order, crossed “Coutts and Co.,” and made payable to Mr. Samuel Thomas Davenport, Financial Officer.

Proceedings of the Society.

CANTOR LECTURES.

“ON POTTERY AND PORCELAIN.” By W. CHAFFERS, Esq.

LECTURE I.—MONDAY, JANUARY 21.

The first lecture of the course on pottery and porcelain was delivered on Monday, the 21st, by Mr. W. Chaffers, who illustrated his remarks by the exhibition of a collection of very fine specimens of ancient pottery of the Egyptian, Greek, Etruscan, and Roman periods, which were attentively examined after the lecture by the members. Behind the chair were placed numerous diagrams of the forms of Greek vases, drawings of the potter's wheel, a Saxon grave, urns, &c. The lecturer commenced by speaking of the nature of clay, and the various changes it was subject to from its primitive state, through all the intermediate stages, until it culminated in the perfect vase, dwelling upon the desiccation and baking of the clay, the means adopted by potters in the formation of vessels, viz., the potter's wheel, modelling tools, moulds, &c., the skill exercised by the artists in decorating the ware, and the difficulties they had to contend with in painting upon the moist clay; the nature of the glazes employed by the ancients; the shrinkage while in the kiln, and many other curious facts in connexion therewith. Mr. Chaffers alluded to the extraordinary circumstance that notwithstanding the fragility of specimens of ceramic art, and their liability to injury, our museums throughout Europe abounded with perfect and uninjured examples not only of pottery, but of the still more fragile material, glass. For the preservation of these we are indebted to the simple piety of the ancients, who, according to their rites of burial, placed in the grave those objects which the deceased esteemed most during his lifetime. Thus we find by the side of the skeleton, in the simple tumulus of earth, in the cinerary urn, or in the stone sarcophagus, gold and silver personal ornaments, fictile vases, and other ceramic remains, glass vessels, weapons, &c.; and this is the source of our possession of such valuable testimonies to the habits and customs of the ancients, for, without exception, all the relics preserved to us have been discovered either in places of sepulture, or in the exhumation of long-buried cities, devastated by conquest, or overwhelmed by volcanic eruptions. The lecturer then noticed the description given by Herodotus of the city of Ecbatana, the capital of Media, surrounded by seven walls of as many different colours, which he inferred were of bricks, or tiles with enamelled surfaces, and compared it with a building of similar character, described by Sir H. Rawlinson as still existing at Birs Nimrud, in Chaldaea, which, from the custom of placing cylinders in the buildings, is ascertained to have been restored by King Nebuchadnezzar 605 B.C., who designated it “The seven spheres of Borsippa.” This structure consisted of six stages, each about 20 feet high, of pyramidal form, dedicated to particular planets, and vitrified or glazed with the colour attributed to it by astrologers. Adverting to the glazed Babylonian bricks, Mr. Chaffers showed the early knowledge of the use of the stanniferous enamel glaze as a covering for earthenware. He alluded to the researches of Mr. W. Kennett Loftus in Chaldaea, who discovered piles upon piles of earthenware coffins covered with glaze in a cemetery at Warka, proofs of the successive generations by whom this method of burial was adopted from its foundation until the place was abandoned by the Parthians, a period probably of more than 2,000 years. The earthenware of Egypt next claimed his attention, which he described as a sort of siliceous frit, frequently covered with a greenish blue glaze; the deities and emblems discovered so abundantly in the catacombs and tombs were many of them steatite, carved into form, and placed in the kiln. The earthenware vessels were used to contain the

waters of the Nile, and for various household purposes. The favourite ornamentation on their vases was derived from the lotus, its buds and flowers, the borders and details being taken from the petals, stems, and divisions of the calix. The most flourishing period of Egyptian art is assigned to a very remote date, viz., 2,000 years before our era. The period of the Ptolemies is known by the marked influence of Greek artists. The frit gives place to a pottery, coarse and soft, sometimes painted on the plain surface and sometimes glazed. This was continued down to the second and third centuries of our era, when Egypt was under Roman domination. In speaking of the Greek fictile vases, Mr. Chaffers said they were found in large quantities in the sepulchres of Etruria during the last century, and hence they were erroneously called Etruscan, even after they were still more abundantly discovered in Magna Græcia, Sicily, Attica, &c. It is indisputable that these vases are the productions of Greek artists, and the style of painting, the designs as well as the inscriptions, are decidedly Greek. This portion of the lecture was illustrated by some remarkably fine Greek vases, kindly lent to the lecturer by Mr. Felix Slade, Mr. Henderson, Mr. Battam, and M. Rollin. For the purpose of classifying the Greek vases he divided them into five periods, assigning approximate dates of antiquity, as follows:—First archaic period, previous to the eighth century B.C.; second archaic period, from the eighth to the seventh B.C.; third archaic period, from the seventh to the sixth B.C.; fourth, the finest period, from the sixth to the fourth B.C.; fifth, the decadence, from the fourth to the second B.C. The peculiar characteristics of each period are as follows:—The first archaic period; of these, the earliest specimens of Greek fictile art, most are discovered at Athens, Corinth, Melos, Camirus in Rhodes, and Etruria. They are very rude, painted in reddish brown or black, on ash-coloured ground, with chevrons, concentric circles, stars, &c., and primitive representations of men and animals. The vases of the second archaic period are abundantly supplied from Camirus in Rhodes, as well as other parts of Greece. They show a great improvement in the drawing of the figures; they are usually of cream-coloured clay, painted with crimson and white, and red on black, the details being scratched with a point, the style of ornamentation being two or more rows of animals (real or imaginary), of birds, harpies, sphinxes, &c. In the third archaic period are found the most valuable Greek vases, of a more artistic character than those which precede it. The figures are painted in black, on a red ground, and the designs are confined to a square tablet between the two handles, the rest of the vase being painted a lustrous black. Mythological and heroic subjects are now introduced, and complicated groups of figures, chariots, and occasionally inscriptions. The fourth is the best period of Greek art. These vases may be especially distinguished by the designs being left red, the ground filled in with black, and the details of costume, features, and anatomical delineations produced by black lines. Sometimes are found black figures on red, and red figures on black, on the same vase. This may be considered a transition from the archaic to the more artistic style. The fine vases of Nola may also be attributed to this period. The fifth period may be called the decadence, and dates from the accession of Alexander the Great, B.C. 336 to A.D. 186, when it is presumed the fabrication of painted vases altogether ceased, shortly after the edict of the Roman Senate against the celebration of the Bacchanalian festivals in that year. As we approach the second century B.C. we find less freedom in the design, a certain mannerism in the drawing, as well as a greater profusion of ornament.

Various specimens of Etruscan pottery were exhibited to illustrate the lecturer's remarks, and the Roman section was copiously illustrated by selections from his own collection, displaying the most striking varieties. The red ware of Arretium was described, as well as the Samian ware, so frequently discovered on the sites of

Roman cities, ornamented in relief with mythological subjects and elegant scroll patterns; it was used by the Romans at the table for their meals. Mr. Chaffers also described other varieties of Roman ware found in Britain and Germany, and vessels of various forms, small drinking cups, inscribed with short convivial sentences, as "Imple," "Reple," "Bibe," "Vivas," "Da vinum;" mortaria, lamps, clay statuettes, &c., specimens of which were upon the table. In conclusion he spoke of the Saxon period, and described the contents of some of the Saxon or Frankish graves, which are dispersed over Northern Gaul, and the earthenware vessels so commonly found among them.

SEVENTH ORDINARY MEETING.

Wednesday, January 23rd, 1867; CHARLES VIGNOLES, Esq., F.R.S., in the chair.

The following candidates were proposed for election as members of the Society:—

Brereton, F. S., 5, Cannon-row, Parliament-street, S.W.

Briggs, Henry R., George-yard Wharf, 36, Upper Thames-street, E.C.

Brinjes, J. F., 25, Fieldgate-street, E.

Cawston, Samuel W., Balham-hill, S.

Grisbrook, W., 154, York-road, Lambeth, S.

Stanger, C., Harley-villa, Grove-street-road, South Hackney, N.E., and 84, Worship-street, E.C.

The following candidates were balloted for, and duly elected members of the Society:—

Bevan, Phillips, Albert-terrace, Windsor.

Davis, Sir John Francis, Bart., K.C.B., Club Chambers,

Regent-st., S.W., and Hollywood, Hambury, Bristol.

Leeke, Admiral Sir Henry J., K.C.B., K.H., Theydon-park, Epping, Essex, and 5, Euston-place, Leamington.

Lewis, Evan, Aberdeen.

Phillips, Thomas Henry, 51, Lime-street, E.C.

Pitter, Joseph, 2, Thanet-place, Strand, W.C.

Railton, George W., Alderley-edge, Manchester.

Roberts, Howland, Neilgherry-house, Hampstead, N.W.

The Paper read was—

THE IRON PERMANENT WAY IN USE ON GERMAN RAILWAYS.

By T. A. ROCHUSSEN, Esq., C.E.

The system of making railways, by levelling a layer of ballast, and forming an upper-structure of wooden sleepers, cast-iron chairs, topped with a wrought-iron rail, and held together by a wooden key, has, for a great number of years, appeared to German engineers to be unworthy an age in which the manufacture of good iron, and its composition into an efficient bearing system, are far better understood than thirty years ago, when the importance of railways as the principal arteries of our social and commercial intercourse was only just fore-shadowed.

While locomotives and rolling stock had in their construction and performance progressively represented the advance of practical science, and embodied the genius of the designer, the care of the builder, and the aptitude of the worker in metal, to provide for all the requirements of traffic, it was felt in Germany, as well as elsewhere, that the time had arrived to apply the same intelligence to permanent way; and that it had become necessary, as much as possible, to reduce the variety of material, and to avoid that most liable to perish, like wooden sleepers, or cast-iron chairs, alike destructive to the wood below and the wrought iron above; and finally, to get rid of the crude contrivance of fixing rails by means of wooden keys. For this reason, the double-headed

rail, copied from English precedent, has enjoyed little favour in Germany, and where adopted, is gradually superseded by the more general practice of flat-bottomed rails, with or without bed plates on the sleepers.

The failure of Barlow's permanent way (perhaps a great deal owing to the use of inferior material) unfortunately discouraged railway directors from pursuing or sanctioning experiments in the right direction, and jeopardising dividends. While, therefore, different scientific papers published a number of schemes for the construction of iron permanent way, some patented, others given away *pro bono publico*, and all of them eagerly discussed at the meetings of practical engineers, the first step to realize a project was only made at the end of the year 1863, by putting in hand the different systems herewith illustrated, some of which came into actual use in the beginning of 1864, others in 1865.

The theory which guided these constructions may be summed up as follows:—

The nearest approach to perfection in a permanent way is to present to a moving load a sufficient, an unmoveable, continuous, and even resistance, as the only means of obviating the oscillation and thumping of fast trains.

Although the weight and height of the rails have been steadily increased, in order to spread the rigidity of the line over a large number of cross sleepers, there remains

in practice an unavoidable deflection of rail between the points of support.

The bending down of the sleeper-end, taking place during the passage of the engine and the oscillation of the carriages or trucks, especially with old or soft wooden sleepers, sufficiently shows that the pressing load is not spread equally over the whole length of the sleeper, and is not evenly supported for the entire length of the wheel base, but that the chair, or point of support, receives a succession of blows, with the whole weight of the load resting on the axle.

If, therefore, we could devise a longitudinal way, possessing sufficient rigidity to transmit the pressure of the load over a large bearing surface, we should avoid the wave-like motion occasioned by the cross sleepers.

This resistance to pressure can be obtained in a simple ratio, by increasing the flat base resting on the ballast, or more economically, by increasing the height of the rail, since the power to support grows in the square ratio of the height.

The boldest and simplest plan of iron permanent way under consideration, was that advised by Mr. Hartwich, engineer of the Rhenish Railway, and laid down on the right bank of the Rhine, between Coblenz and Oberlahnstein, on a perfect level, and also between Mechernich and Enskirchen, the latter an incline of 1 in 70, and on a curve of 800 yards radius.

FIG. 1.

The ballast, always an object of especial solicitude with Prussian engineers, is of broken flint, and laid in a channel three feet broad at the top, shelving down to one foot, and eighteen inches deep. The rails shown in section A (see Fig. 1) eleven inches high, weighing 115 lbs. per yard, with a flat bottom of four inches, are placed immediately in contact with the ballast, and sleepers or bedplates are dispensed with. The space between the rails up to the middle of the head, and also the clear way outside the rails, are filled with fine gravel, tightly rammed in.

The rails are fished vertically and horizontally, as the rail of section B, nine inches high, which has since been ordered to the extent of fifteen miles, on the line between Kempen and Kaltenkirchen, and its adoption is likely to extend with the growth of Rhenish railways to the exclusion of the eleven-inch rails, which were found unnecessarily heavy and expensive. These rails are nine inches high with a flat bottom five inches wide, weighing 85 lbs. per yard; the head, down to one inch of the web, is formed of steel, the web of fine grain, and the bottom of fibrous iron.

The vertical fish-plates, eighteen inches long, have two rows of fish-bolts for each rail-end, and to increase

their stiffness have a longitudinal rib, resting against the web of the rail. The horizontal fish-plates, also eighteen inches long, are eight inches wide, and their connection with the rail is established by means of a cramp-plate, held between the nuts of the fish-bolt, and bearing upon the base of the rail. The use of this cramp is principally to allow a greater width of fish-plate, and to protect it against buckling up by the pressure of the rail. The rails are held to gauge by one-inch round bars, placed three feet apart, the ends of which are provided with a screw-thread, nut, and washer, at each side of the web, so as to allow an easy adjustment of widening or narrowing the rail distance to the proper gauge. Alternately, the cross, or gauge bars, are put either three inches from the top of the head or three inches from the bottom of the rail.

The whole weight of the system is 145 tons per mile per single line of way; the contract price all round being £13 15s. per ton; or, exclusive of ballast and laying down, £1,985 per mile.

The engineer reports:—"Since June, 1865, the double line from Coblenz to Oberlahnstein and the Mechernich line have been worked with tender-engines weighing 37½ tons; no alteration has taken place in the level of

the way, and the rails have nowhere worked into the ballast. The gauge has not in any instance been disturbed, the repairs of packing have been very trifling, and far less than on the line with cross-sleepers. The whole length forms a continuous, unmoveable railway; and although there is a little bending at the fish-joints, this inconvenience is imperceptible compared with the advantages of the whole system. The filling of the rail space with gravel, provided a more efficient security against sliding than the dogs and bolts in the wooden sleepers. The motion on the rail is perfectly free from oscillation and thumping; the noise of the passing train has a deep rolling sound, and although some passengers, who are acquainted with the peculiarity of the construction, pretend that the line is hard, the difference is not noticed by the majority of travellers. Whether the rigidity of these high rails will be more detrimental to themselves than the constant bending on cross-sleepers, time will have to show. If this disadvantage should manifest itself, it could be met by increasing the elasticity of the springs; on the other hand, the rigid surface offers a saving of traction power and wear of wheels, considering that with rails bending between sleepers every wheel practically runs on an inclined plane. It may be urged that, if once the rail heads should be worn out, the whole system will require renewal, but as an extensive experience with steel headed rails in Prussia, during 14 years, has shown that the life of a good rail, even under very onerous circumstances of traffic, is about 21 years, this objection falls to the ground, the more so since the rails

of the present day, on wooden sleepers, have already reached the same weight per yard as our whole system without sleepers."

In the beginning of the year 1864 the Hoerder works, in Westphalia, supplied the Brunswick Railway with the two systems of iron permanent way represented by Figs. 2 and 3, each of about 1,100 yards in length, and some time afterwards with another variety of the same system, represented by Fig. 4.

The two first are lying side by side on the distance between Brunswick and Wolfenbuttel, that portion of the main line from the west to Berlin on which the wear of oak sleepers and the general repairs of the permanent way had been the heaviest of the whole distance between Cologne and Berlin.

The three systems embody the principle of supporting the head of the rail between the vertical arms of two angle bars, riveted together, and held to gauge by cross-bars, the dimensions and distance of which, as well as of the angle-bars themselves, being varied in order to ascertain the maximum limit of saving material which may be approached without jeopardising the efficiency of the construction.

In the system shown in Fig. 2, the longitudinal rectangular angle-bearers measure 6in. \times 6in. \times $\frac{1}{2}$ in., and are placed half an inch apart, to allow the web of the head rail to slip in. The gauge, or cross-bars of T iron, 4in. \times 3in. \times $\frac{1}{2}$ in. are placed five feet apart, and are riveted below to both the horizontal arms of the angle-bars.

FIG. 2.

The head-bolts, connecting the head-rail with the rail-bearers, are 16 inches apart, and the bolt holes are elliptical, to allow contraction and expansion. The ends of the angle-bars are joined horizontally by fish-plates, 12in. \times 12in. \times in. \times $\frac{1}{2}$ in., fixed with eight screw bolts, say two bolts to each end. The head-rail and rail-bearers break-joint—the ends of the former being thus supported by a continuous bearing of the latter. This system of construction gives 334 square inches of horizontal bearing surface per running foot, that is to say, 300 square inches from the horizontal arms of the angle, and 34 square inches from the cross-bar.

FIG. 3.

In system No. 3 (Fig. 3) the rail-bearers are formed by angle-bars of 93°, the dimensions of which are reduced to 5in. \times 5in. \times $\frac{1}{2}$ in., the head-rail, head-bolts, and their distance apart being the same as in system No. 2; but the cross-bars, here placed only three feet apart, were made of flat bar 3in. \times $\frac{1}{2}$ in., ending in a T section, which is riveted through the two arms of the rail-bearers. In order to prevent the squeezing together of the latter, a half-inch fillet-plate is inserted between them. The fishing of joints is effected as in system No. 2, and the horizontal-bearing surface is 274 square inches per running foot of railway.

On the wear of the railway, the engineer, Mr. Scheffler, reports as follows:—"The two systems lie side by side in a straight line, half the distance being on well-drained large gravel, the other half in fine gravel mixed with clay, very impermeable to the percolation of water. Both lengths have been worked for more than two years, and are in excellent preservation, continuing to bear a heavy express, passenger, goods, and mineral traffic. The state of the rails has been uninterruptedly satisfactory, and they have not required the same labour of keeping up which was necessary for the other portion of the railway. This contrast was especially remarkable in winter during a prolonged low temperature. After the thaw in the spring of 1865 only in the system No. 3, in those portions of the line where the ballast is unusually bad and clayey, a few instances of sinking occurred,

not to the same extent as on the line with cross wooden sleepers; however, on the larger portion of system No. 3, sand on the whole of system No. 2, no packing or adjusting of any kind has been necessary. This favourable result is, perhaps, to be ascribed to the great height of the rail-bearers, which permit the bearing surface to lie deep in the ballast, and reduce the influence of frost on the base of the rail. The packing and lifting, when required, are an easy operation, and these constructions have shown no instability—a gratifying fact, since eminent engineering authorities, looking at the flat base of the rail-bearers, predicted a shifting sideways of the whole line. After two years' heavy traffic no displacement has been perceptible; all the component parts of the iron permanent way are in their original good condition; not a single rivet has worn loose, but the nuts of the head-bolts require now and then to be tightened with a spanner, as in those of the fish-plates of the ordinary construction. The iron, including the portion submerged in the ballast, has been oxidised to a trifling extent, and hitherto experience has not justified the preference of one system over the other. The motion on both systems is a little harder, but, at the same time, much more steady and smooth, than on the most carefully constructed permanent way with wooden sleepers. Hitherto it has been impossible to note any difference in the motion of the carriages during the various influences of extreme heat or cold, it is the same in winter as in summer. In the manufacture of the rail-bearers for systems Nos. 2 and 3, the Hoerder works found a difficulty in rolling the top of the vertical arm to a sufficiently clear edge, and this inconvenience necessitated their being planed. In order to obviate this expensive operation, the Hoerder works proposed to roll the top of the vertical arm with a bulb or rib, which allows a true edge to be produced without any further mechanical finishing. The Brunswick Railway thereupon resolved to adopt this bulb angle in their last system, No. 4 (Fig. 4.), embodying the weight of the smaller section No. 3, which in practice had proved

FIG. 4.

sufficiently strong, at the same time giving a conical form to the head bolt, in order, when tightening the nut, to press the head rail down on the rail-bearers. This head is made of cast steel. While keeping to the weight of the former section they increased the height of the vertical arm to $6\frac{1}{2}$ inches, the horizontal arm to $5\frac{1}{2}$ inches, the thickness of both being $\frac{3}{8}$ ths of an inch full. Another deviation from systems Nos. 2 and 3 is the form of the cross-bars, which are of channel or C iron, 4 inches \times $1\frac{1}{2}$ inches \times $\frac{3}{8}$ ths of an inch, placed five feet apart, as in system No. 2, and are fastened with bolts and nuts through the two vertical rail-bearers. The horizontal supporting surface of this system is 306 square inches per running foot of railway. It does not appear advisable to place the cross-bars at a greater distance from each other, since they not only serve to keep the line to gauge but also contribute in holding each

pair of rail-bearers together to prevent their backing and, at all events, the greater rigidity of the system compensates for the trifling, if perhaps superfluous, outlay. Experience will teach us the maximum distance of the cross-bars, and also whether a large number and their submersion in the ballast offer (as we have hitherto found) a sufficient resistance to the supposed tendency of the railway to move sideways, or whether it is advisable, for additional security, to adopt keel-fishes. The cost of the iron permanent way, exclusive of ballast and laying down, has been 36s. per yard, or, with laying down, £3,200 per mile, as against 25s. per yard or £2,250 per mile for the ordinary construction with wooden sleepers. The weight of the three systems is—No. 2, per yard, 354lbs.; No. 3, 295; No. 4, 300. The Hoerder works supplied the material for systems Nos. 2 and 3 at £13 5s. per ton, delivered at Brunswick; but for system No. 4 stipulated an advance of 5s. per ton, on account of the wider dimensions of the angle bars, which necessitated the use of better iron. The building up and laying of the permanent way, after the labourers got used to the work, progressed rapidly; the cost of laying down was 10d. per yard, as against 7d. per yard for the old system. The ballast under the iron way is of the same depth as that under the wooden sleepers, viz., 12 inches, and practice has shown this to be sufficient.

"The experience of two years has not yet furnished conclusive data exactly to fix the cost of keeping up the line, but we have found—

"1. That packing has been much less needed than with the ordinary cross-sleepers, and the expenses under this head are merely nominal.

"2. The rails have not required any repairs; neither head-rail nor rail-bearers have been renewed or altered; and it is remarkable that the rail-ends have suffered much less (owing to their uniform support) than on the cross-sleepers.

"The principle of longitudinal construction is, in theory, the most correct, and is borne out by practice. The even continuous bearing is of immense importance to the permanent way, as well as to the rolling stock, and gives a much easier motion to engines and carriages.

"The uniform rigidity of this rail system, and the perfect support of the head-rails, show a marked improvement in the wear of the heads. The use of rivets—in places where frequent renewals are not likely to occur, as in parts covered by the ballast, and therefore not much shaken—is not objectionable. The number of component parts is not large, their connexion is easily established, and practice has proved the construction to be strong. The rigidity of the iron permanent way, both vertically and horizontally, is much greater than that of the cross-sleepers. This is proved, not only by the analysis of form and dimensions of the section, but also by the steady motion of the rolling stock, and this advantage is conspicuous in express and heavy mineral trains."

Thus far Mr. Scheffler. After the favourable experience obtained on the Brunswick line, the Hanoverian, Cologne-Minden, the Saxon and Wurtemberg State railways, have resolved to lay down experimental lengths of iron permanent way, constructed on analogous principles.

The Hanoverian system, illustrated by Fig. 5, was made by the Hoerder works, according to the specifications of the engineer of the line, but it does not appear to offer any advantage in theory, while its cost is much higher than that of the Brunswick system. The Hanoverian permanent way has the same cast-steel head as system No. 4; but the rail-bearers, $\frac{1}{2}$ inch thick, are formed of angle-bars of 115° , $5\frac{1}{2}$ inches high, and $6\frac{1}{2}$ inches base, giving a horizontal bearing of 12 inches wide, equal to 288 square inches per running foot of railway.

The rail-bearers are riveted together, with a fillet plate, as in system No. 3. The head-bolts, conical, as in system No. 4, placed 18 inches apart, have a collar

under the nut, which, pressing the rib of the angle, counteracts the supposed tendency of the head-rail to incline outwards.

FIG. 5.

The bars, 3 feet apart, of 3 inches \times $\frac{1}{2}$ inch flat bar,

are, as in system No. 3, riveted with T angles to the angle-bearers. The keel fish-plates are formed of T iron 5 inches \times $2\frac{1}{2}$ inches \times $\frac{1}{2}$ inch. About five miles of the iron permanent way were laid down in 1866, which give a very satisfactory result; they will, however, only be thoroughly reported on after next spring.

A variation of the iron permanent way of systems Nos. 3 and 4, is now being constructed at Hoorde for some German railways, on a plan patented in the country by the author, and the advantage of which was developed during the manufacture of the material for the Brunswick and Hanoverian way. (Models, full and half-size, were on the table.) When the metal used for the head-rail was changed from the use of iron to the use of cast-steel, it was no longer practicable to punch the bolt holes in the web, and every hole had, at considerable expense, to be bored and slotted out.

Besides, under all circumstances, particular care was required in correctly adjusting the holes in the web with those of the rail-bearers. These combined considerations made it desirable to devise a system establishing a direct and strong connexion of the head-rail and rail-bearers, without the head bolts passing through both, and led to the combination illustrated by Figs. 6 and 7.

The bulb or rib of the vertical arm instead of being placed outside, as in the Brunswick permanent way, No. 4, is here turned inwards, and is rolled into a dwarfed T section, thus forming a groove into which the ribs or bulbs of the rail-bearer gripe; and the whole system is

FIG. 6.

tightened and firmly held together by the screw bolts, or wedge keys, passing through the rail-bearers under the head without touching the web at all. The head bolts are placed 20 inches apart; and in order to prevent

their pressing the angle bars closer together than necessary, a stop rivet is placed under each of them near the throat of the angle, which thus keeps each pair of rail-bearers at the proper distance from each other.

FIG. 7.

In Fig. 7 a plan is suggested to effect economy of material by slightly reducing the height of the rail, and replacing expensive screw bolts with cheaper keys and

wedges, all of which can be simply rolled as a bar and cut off to the requisite size.

The cross bars of these systems can, of course, be made

of any section of iron. Those now making are partly of double T iron, partly of angle iron, bolted to the inner arm of the construction. By these means the outer arm of the rail-bearer can at all times be removed for the purpose of shifting, reversing, or renewing the head rail, without disturbing the gauge of the railway. The cross bars are most conveniently fitted near the end of the rail-bearers, where they contribute to stiffen the fish-joint, and at the same time serve admirably as supports of the points, which move easily over the flat surface of the cross bar.

In order to prevent the aliding backwards and forwards of the head rail by the friction of the wheel, a square stop bolt is applied to the head, passing through a notch in the web at each end of the rail. A few holes are punched here and there in the horizontal arm of the rail-bearer to assist in draining the ballast.

It is scarcely necessary to urge anything in favour of the principle of longitudinal permanent way generally. In some countries the first cost may appear greater; but the ever-increasing expense of keeping up wooden sleepers, especially in hot climates; the interruption of and danger to traffic during repairs; and, on the other hand, the advantages offered by the iron way of decreased wear of rolling stock, as well as increased safety and comfort in travelling, are considerations of such importance as to render the abandonment of the present cross-sleeper construction merely a matter of time.

In the systems just described the life of the iron parts is practically unlimited. The only portion subject to gradual wear is the steel head, weighing about 34lbs. to the yard; and this economical application of the more expensive material justifies the engineer in using crucible cast steel of a high class, instead of the cheaper but less durable Bessemer steel, which, for good financial reasons, is the only steel which railways have hitherto allowed themselves to use.

The weight of the new system, as per dimensions shown in Fig. 6, is 223 tons per mile; the cost, inclusive of laying at 9d. per yard, about £3,100.

The weight of system No. 7 is 193 tons, and the cost about £2,700 per mile of single railway. But these prices are based upon the use of high-class Prussian iron, at £12 to £14 per ton, and bolts from £24 to £30 per ton; with the use of English iron the cost per mile should not exceed £2,200 per mile.

I would finally urge, in favour of the iron permanent way, the consideration that wood is getting scarcer and dearer every year, and may well be saved from decaying in the ballast in order to fulfil the nobler mission of meeting the numerous wants of our domestic and social habits and dwellings. And if railways in England and its colonies were generally to adopt the iron permanent way, an immense impulse would again be given to an industry now unfortunately languishing, but the prosperity of which forms the back-bone of the wealth and power of this country.

DISCUSSION.

Mr. ROBERT MALLET, F.R.S. (responding to the invitation of the chairman), said he had listened with great pleasure to the paper, some of the details of which he was before, to a certain extent, acquainted with, having himself seen the permanent way alluded to in Germany last year. He thought no doubt could be entertained, in the present day, that the epoch of timber sleepers was approaching its close, but the question arose what we were to substitute for them. There were two or three principles which were incontrovertible with regard to permanent way—one was that the nearer we approached to a lathe bed the nearer we were to perfection, but in a lathe bed we had a uniform load passing over it at a uniform speed, and a uniform support for the entire length; therefore, we could afford to make the bed of perfect stiffness, and could maintain it true. A railway was placed under different circumstances. It could only be supported at intervals. For, even if it was a continuous iron way, resting upon continuous ballast, it was in fact only supported at intervals. If the table of the rail itself were of such a weight, and possessed such inertia that the load in passing over it caused concussion at the immediate attachments of the rails, it mattered not if the material of the ballast were india-rubber, the result would be the destruction of the rolling-stock in proportion to the inertia of the table it ran upon. They might mitigate this by springs as regarded the carriages, but they could put no springs between the wheels and the axles. Wheels of 4 feet, or 4 feet 6 inches diameter, and often 2½ inch tires, with axles often 7 inches, and seldom less than 4½ inches diameter, were in themselves prodigious hammering masses, and at high speed there was practically a succession of hammering blows. Take any point in the circumference of a wheel: that point described a cycloid, and at each moment of its touching the rail the tangent of the cycloid was perpendicular to the rail, and thus the point descended with a direct hammering blow, the effects of which were in proportion to the weight of the wheel and the velocity with which the point of the periphery struck the rails. There was therefore a succession of blows, which they must mitigate as best they could. If they had an enormous inertia in the metallic parts of the rails, the result would be similar to that illustrated by Belzoni the traveller, who placed a heavy anvil on his chest, and allowed blacksmiths to strike it with hammers. This appeared to be a feat of marvellous strength, but so long as his ribs were strong enough to bear the weight of the anvil, the force of the blow was expended on the anvil itself, and the heavy permanent way just did the same thing. It therefore appeared to him that if they adopted iron sleepers they must arrange to make the bearing elastic in some way, but how that was to be effected with these deep rails and double angle irons appeared to him a matter of some difficulty. There could be no question that an enormous advantage was gained by the substitution of steel for

iron in the upper part of the rail. The London and North-Western Railway, which was considered as a pattern railway in respect of the large traffic and the regularity and rapidity with which it was carried, had substituted steel for wrought-iron rails, without reduction in the weight of metal. They were not attempting to economise in the outlay for the substituted rails, but the economy was looked for in the greater resistance to wear and tear. He believed the experience of Mr. Rochussen with steel rails for the light traffic of the German lines had been different to that in this country generally. He apprehended the life of a steel rail, instead of being 21 years, would, on some parts of the London and North-Western, scarcely be as many months. At the same time, there was no doubt the steel rail was the right thing. If they got a material which did not hammer down, or laminate, as the surface of soft wrought iron did, there was the greater reason why, with an enormously rigid material like steel, they should have beneath it an elastic support. He only ventured to assert that as a principle, because if he went into particulars it would lead him to talk of himself as a permanent-way inventor, and he would be sorry to do that. He confessed he did not see that that was effectually done by these angle-irons. It was very similar to what our ingenious fellow-countryman, Mr. Bridges Adams, had patented; the main difference was that he turned the angle-irons the other way. It seemed to him, in the arrangement adopted on the German railways, there was a certain liability to become uneven. The steel top, which bore the load, itself rested upon the narrow edges of these two angle-irons. In all these systems the question was what amount of surface had they in the angle-iron to support the steel table above; because though the steel top might be permanent, it was doubtful whether the angle-iron might not give way at the point of contact with the steel top. He confessed that the bearing surface in the case before them appeared to him exceedingly small, and he apprehended some difficulty in that direction. But no man, not even the chairman, who was himself one of our most successful designers of rails, could predict beforehand what would be the results of the working of any permanent way; nothing short of actual trial under rolling loads would decide whether a permanent way would answer or not. He was far from attempting to dogmatise with respect to these German lines. The system might be found to answer there better than he expected; and his general observation of those lines showed that for the most part they had hitherto worked well.

Mr. ROCHUSSEN wished to speak with the highest respect of Mr. Adams's system, and he regretted that it had not been adopted in this country to the extent which he considered its merits deserved. The difference between the two systems was, that Mr. Adams's was a suspended rail, held with two angle bars, in which the angle, instead of standing up, was hanging down. It would have been well to have had more experience of that system.

Mr. VABLEY remarked that a rigid permanent way appeared to be excellent to a certain extent, but that a due amount of elasticity in the bearings must be provided. It occurred to him that it would be well to ascertain positively the flexure of the rail, and then make it so convex as to keep it level by the weight. He had passed over the railway at Chat Moss, where the road was highly elastic, and it was the smoothest travelling he had ever experienced.

Mr. W. BOTLY said, mention having been made of the Bessemer cast-steel, some few years ago it was considered a great triumph of science that steel could be produced in about two hours, which operation formerly took, on an average, about a fortnight. It had been stated in the paper that the Bessemer steel was not so good as that which had been converted by the crucible process. He wished to know whether this was generally admitted.

He apprehended that the welding of the harder material (steel) upon one of a more elastic nature (iron) furnished the conditions that were required for a permanent way. He begged to ask whether greater inconvenience, in respect of the wheels of the carriages not biting the rails under certain circumstances, was experienced with steel rails than with iron rails.

Mr. ROCHUSSEN said no one was more convinced than he was of the merits of the Bessemer invention. But on the other hand he believed Mr. Bessemer himself would be the last to advance that his process could produce a metal which in every way equalled the old crucible cast steel. It was a method of converting cast iron into malleable iron, and then into steel, which had all the convenience of being cheap, and of enabling them to deal with large masses of material. That system had been worked as successfully in Prussia as in this country, and he believed the manufacturers of Prussian Bessemer steel had no reason to be ashamed of their production. He admitted that the "biting" of the wheel on a steel rail was less than that on an iron rail, but they found less inconvenience from that in Prussia, inasmuch as the weight of the rolling stock upon the same wheel base was almost double that of the rolling stock used in England. First class carriages weighed from 10 to 11 tons. The luggage trucks were of the capacity of 10 tons each, and this remark would more or less meet the observation made by Mr. Mallet with reference to the supposed light traffic on the Prussian railways as compared with this country. These rails had been laid down on the German lines for the most part where the traffic was exceedingly heavy, and where it was necessary to provide something more durable than the old system afforded. The duration of steel rails, which he had advanced as being 21 years, was proved by the steel rails laid down at the Hamm station in Westphalia, which might be regarded as a counterpart of the Crewe station in this country—not that the traffic was so great, but it was the principal junction on the Continent for the mineral and coal traffic; and when a discussion on steel rails took place at the Institution of Civil Engineers, he produced some rails which had been taken from that junction, where they had been in use 12½ years, after having sustained a traffic of 50 millions of tons of goods. Those rails, which were of the Vignoles form, had then only one side of the head slightly abraded; they were not in any way worn, and were fit to work for another five years at least, having the other side of the head untouched. Those rails were only 56 lbs. to the yard, having been made at a time when engines weighing from 37 to 48 tons were not dreamt of, and when, if such engines had been in use, iron rails of 85 lbs. would have to be laid down. With regard to steel-headed as compared with solid steel rails, he would remark that it was the compound nature of the rail which formed the backbone of support to the load. As Mr. Mallet observed, they wanted elasticity, and how did they provide it in a steel rail? They could not weld the steel to iron upon that large scale; therefore the steel was made to rest directly on the material which had the greatest affinity for it, viz., puddled steel, and below that they placed the most elastic fibrous iron that could be found. If, from motives of economy, they did not use cast steel for the head, they employed puddled steel, and fine grain iron for the web, such as was known in this country as the Low Moor, and again fibrous iron at the bottom. But in speaking of this kind of permanent way, regard must be had to the support it received from the ballast which, in the Prussian system, formed a most important portion of the line, for the work ordinarily thrown upon the sleepers was, in a great measure, done by the ballast, and by that means the violent concussions described by Mr. Mallet were avoided, the ballast in reality taking a large portion of the work of the line.

Mr. JULIAN DANVERS wished to ask one or two questions, being interested in the construction of railways and public works in India. It seemed to be

universally acknowledged by the preceding speakers that the use of wood for sleepers was condemned. He would be glad to know why that was the case? He saw in this country wooden sleepers almost universally adopted, and this was also the case on the Continent, except on some of the German lines. In America iron had rarely been introduced for sleepers, and yet it appeared that wood was now generally regarded by the profession as a failure. This was a very important question as regarded India, where timber was plentiful, but hitherto they had been unable to supply iron; all the iron was obtained from Europe, and this increased very much the cost of railways in India. Wood had certainly failed there as sleepers, and half the lines were constructed with the iron pot-sleepers. He was anxious to ascertain why, if good durable wood could be obtained, at a much cheaper cost than iron, it should not be made use of; and why, as a general rule, iron was so much preferred? He knew many instances in which iron had cracked, while wood often lasted a considerable time. A short time ago he was requested by the India Department of the Government to inquire into this question, and the conclusion which he reluctantly came to, after taking all the evidence he could collect, was, that unless a cheaper and more durable wood was obtained in India, it would be desirable to employ iron sleepers very generally in that country.

Mr. MALLET added, on the subject of wooden sleepers in America, that the abundance of that material put iron sleepers quite out of consideration. Wood was almost a drug, while iron was the most expensive material that could be employed in construction in that country. The railway system was begun there by using strips of wood with bar iron, little better than hoop iron, on the top; now they had iron rails, and by-and-bye they might get to iron sleepers. With respect to sleepers in India, hard wood was principally used for the purpose, and was said to be very durable, if protected from the attacks of the white ant; otherwise it was rapidly destroyed. In tropical climates, not of the arid nature of a large portion of India—such as Panama—wooden sleepers had disappeared in a remarkable manner very rapidly, though composed of very hard wood. Wood was an increasingly dear commodity in this country, and would not stand the traffic of our lines, unless oak were employed, which could not be obtained in sufficient quantity. He believed the chairman would confirm the statement that in Russia oak sleepers were used almost entirely.—[The CHAIRMAN said this was the case in Russia wherever it was possible.] With reference to what had fallen from Mr. Rochussen on the subject of the different qualities of steel for rails, he (Mr. Mallet) did not think it of much importance whether crucible steel or Bessemer steel were used. It was simply a popular error to suppose that Bessemer steel was worse for the purpose than the best cast steel made by cementation in a crucible. He had seen as good steel made by the Bessemer process as by that of cementation, but the commonest Bessemer steel could be made into good steel, possessing every necessary quality, by allowing the metal to remain in a melted state for some time in a reverberatory furnace. M. Sudré was the first to show that steel could be melted in a reverberatory furnace, and that if the mass of molten metal was covered by a coating of glass, of the quality of ordinary wine bottles, the steel was effectually protected thereby from the action of any sulphurous matter which might be contained in the fuel. Independently of that, however, a new process of steel manufacture had grown up since the introduction of the Bessemer process. It was found that very excellent steel might be made by melting down scrap iron in pots, which might be heated twenty at a time in the Siemens furnace; and, with the addition of spiegel-eisen to the fused mass, and by stirring it up well, it was converted into steel. That process was now in operation by Mr. Siemens, and the result of his working was, that he could make a ton of steel with the consumption of a ton of coal; and he (Mr.

Mallet) had no doubt that, though the Bessemer process would always be regarded as a grand revolution in metallurgic art, the last process to which he had alluded, had a vast future before it. The great advantage of it was, that old wrought iron rails might be cut up, melted, and reproduced as cast steel.

Mr. LIVERSAY stated that on the London and North-Western Railway many thousands of tons of steel-headed rails had been laid down, consisting of Bessemer steel welded to the body of the ordinary rail; but between the Bessemer steel and the ordinary rail there was inserted a puddled bar of very soft iron, and by that means they got an almost perfect weld. He knew several railways in this country on which the old rails were being replaced with rails with Bessemer steel heads welded as he had described. He had reason to believe that the steel-headed rail would supersede the solid Bessemer steel rail. He had heard that in America the solid Bessemer steel rails had given way to a great extent in severe weather, and it was thought they would have to fall back upon the steel-headed rail in preference.

The CHAIRMAN said, before proposing the customary vote of thanks to the author of the paper, he would briefly express his own opinions on the subject, and in so doing he was sure Mr. Rochussen would pardon him if he differed from him in some of the points brought forward. Mr. Rochussen had proceeded, as far as he (the Chairman) understood, on the principle of making the bearing surface and rail as rigid as possible; but as far as his own experience went—and he believed it was that of most engineers—there should be, as Mr. Mallet said, some elastic substance interposed to guard the necessarily stiff rail from the impulsive action of the engine and train that ran over it. Thirty years ago that was demonstrated almost to a certainty. The line between Manchester and Bolton was laid in the most rigid manner possible, the consequence of which was a continual fight between the railway and the locomotive, which thus became mutually destructive to each other. It was admitted that there must be elasticity, and the reason why there was the smooth motion over the line at Chat Moss, which had been mentioned, was because of the elastic base on which the rails were laid. Therefore he did not concur in the principle laid down by the author of the paper. He would not cavil at the multitude of parts constituting the permanent way, or at his ingenious contrivances for securing the rail, so as to diminish the expense of his system; but for his own part, he thought that this complication produced more harm ultimately than was counterbalanced by the saving of expensive material. He had yet to learn, and he feared Mr. Rochussen had not sufficiently considered, what would be the effect under severe traffic of the bearing of the steel rail-head upon those narrow supports. The last speaker alluded to what was going on on the London and North-Western Railway; but perhaps he was not aware that for the last few years the specifications for the manufacture of rails had usually been that the hardest material should be put at the top, and the base should be formed of fibrous iron. The highest point of excellence at which that system had arrived was the substitution of steel for the top of the rail, and practically they had now the means of connecting the steel top with the base and sub-base of the rail by welding, in a manner more simple than that described in the paper, and without involving its many complications. With respect to the question which had been asked by Mr. Danvers, why wooden sleepers were to be abandoned, he (the Chairman) would say that his old-fashioned notions led him still to be an advocate for wooden sleepers. He thought when they looked in the first place at the admirable simplicity of a fished rail, without chairs, laid upon wooden sleepers, and considered the first cost of that system, and also of its periodical renewal; and when, in the second place, they calculated how much more capital had to be expended in laying down one of these expensive iron systems, they would find, spreading

the cost over a number of years, that the wooden system was the more economical. He had found in South America, and especially in Bahia, a hard wood, which resisted the white ant provided it was cut at the proper season. He found that the cost of sleepers of that wood was very little more than the softer wood imported. With respect to India, he might state that 20 years ago he had the honour of reporting to the East India Company upon the introduction of railways in India, and he recommended at that time that the harder woods of the country should be employed as sleepers, because it was well known that if certain hard woods were cut at the proper season, they would resist the white ant, and last for eight or ten years. Moreover he had known creosoted timber to last for fifteen years without the least decay. He had tried the iron pot sleepers; wherever there was sand and perfect drainage, those sleepers succeeded, as, for instance, in Egypt, but if the ballast was composed of broken stone or clay, they gave way. The Chairman concluded by proposing a cordial vote of thanks to Mr. Rochussen for his paper.

The vote of thanks having been passed, Mr. ROCHUSSEN, in acknowledging the compliment, said he had brought this paper before the Society simply as a record of what had been done in Germany. He confessed he thought, when he first saw some of these plans, they could not answer, but experience had shown that they were at least worthy of some consideration. The compound rail had been in use in Germany 15 years, and it was found to be a step in advance, and upon that the systems he had just explained were in some respects founded. But perhaps they were more applicable to hot climates, where suitable wood for sleepers was difficult to be obtained. The system of steel making described by Mr. Mallet was not new in Germany, for a manufactory had been established in Westphalia which produced the same results, though by somewhat different means.

PARIS EXHIBITION, 1867.

To the general regulations published by the French Imperial Commission was appended a table of dates assigned for the termination of the various stages of the undertaking; the building was to be completed by the first day of December, and the installations of exhibitors by the fifteenth of January. As regards the building, there was a pretty general feeling that the promise could not be kept; but although the hammer still rings in the great temple of industry, and the paint brush has still a vast amount of work to do, the Imperial Commission virtually kept its promise, for all has been done that was actually necessary for the purposes of the exhibition. Workmen are now completing what may be called the extra portions of the building, such as the projecting roofs over the four main entrances, the grand vestibule, and other parts, but all the industrial courts—or galleries, as they are called, in the sense of the application of the word to picture galleries, which may be on the ground-floor, as those of the new Exhibition all are—were completed and glazed, all the avenues and passages laid in cement, and ready for the fittings to be erected about the time specified. This is a fact which deserves to be recorded, and which holds out the best possible guarantee for the fulfilment of the remaining promises of the programme. The amount of work that has been executed, and the regularity with which all the various operations have proceeded, reflect the greatest credit upon the directors of the undertaking, and have called forth the admiration of all who have visited the works from time to time.

A simple statement of what has been done, and is now in hand, will be the best comment. Commencing, then, with the outer zone or gallery—the great machinery and processes court—workmen are finishing the great windows over the entrance doors, as well as the arcades below, and the projecting *marquises*, or roofs, for the

convenience of visitors; painters are swung by hundreds just beneath the huge roof, covering the dusky iron with a tint of light chocolate or coffee colour, and picking out the lines and rivets with vermilion and white; glaziers are filling in the windows as fast as the iron men leave them, and the whole enormous area below is cleared. Along the entire centre of this enormous circular gallery is a double row of cast iron pillars, about 15 ft. high, and 8 ft. apart, joined together by longitudinal and transverse lattice girders, and having large brackets standing out on each side; these brackets are to receive the shafts for the conveyance of power to machinery in motion; and on the girders above is being constructed a gallery, which will be about 10 ft. wide, and will enable visitors to pass along the entire length of the machinery court, and survey the Exhibition on each side with advantage. As this gallery occupies no space that could otherwise be appropriated, it will be a clear gain to the public. There will also be a passage below between the pillars.

In some parts of this court the foundations for heavy machinery are being prepared, and it would be well that those who have much to do in this way should lose no time; they can work now without interruption, whereas shortly this will not be the case. In the British portion of the machinery court some partition walls have been run up, which indicate that applications for space in this court have been more numerous than in the alimentary gallery beyond, some portion of which is thus taken into the former.

Proceeding inwards to the industrial galleries, called intermediate, as lying between the greater outer zone of the machinery court and the fine-art galleries of the centre, we find the carpenters busily at work in all directions; on the French side a great amount of wood-work is completed, and more under hand; in several classes the courts are not only formed, but nearly the whole of the framework of the cases is in position, and might be finished off, as regards carpenters' work, in a few days; the high partition walls required for the tapestry of the Gobelins and other manufactories are partly completed, and almost every portion of the French industrial courts is under hand. It is nearly the same in most of the other foreign courts; each country is being fenced off from his neighbour, and getting his main wood-work in place; the limits of Northern, Southern, Eastern and Western Powers are defined. Russia is indicated in one place by a characteristic pierced wooden railing, with heavy corner posts, mounted on stone pedestals, which will form the limits of the courts belonging to that country. Proceeding on the tour of the building, we traverse the small countries, or rather the small spaces devoted to the vast countries of China, Japan, Mexico, South America, &c., and arrive in the department of the United States, where the carpenters are hard at work. The remaining portion is devoted to Great Britain; here the sappers are now marking out the floor, and there is nothing to hinder the immediate erection of partitions, stands, and cases.

It was said that portions of the floor were to be covered with asphalt, but this appears to have been an error; at any rate there is no appearance of the asphalt furnaces; and the deliverance from its stifling fumes must be a source of satisfaction for all engaged in the building. The whole of the exhibiting space in the intermediate galleries is floored with wood, and the work is well done. The avenues and passages are all laid in cement, or in what is called *béton aggloméré*, which presents no difference to the eye or the foot.

The fine-art galleries, which form the inner ring, are not quite finished, but will be very shortly; the roofs have all been glazed for a considerable time; the floors of the larger gallery—that appropriated to the fine arts pure, painting, sculpture, architecture, &c.—are laid in cement, while the gallery of the history of labour, or retrospective museum, has an oak floor. The walls

of the greater portion of the fine-art gallery have been covered with wood, papered, and coloured a Venetian or Pompeian red. Suspended from the ties of the roof are semi-opaque screens, or false ceilings, to moderate the light; in the department of the gallery situated in the straight portions of the building, the effect of these screens is agreeable, and they present nothing remarkable to the eye, but in the curved portions of the gallery—and all the British fine art gallery is in the circular part of the building—the effect of these screens is most disagreeable; the first thing seen on entering the room is this screen, which looks like a huge comma dropping from the ceiling, with its tail running round the corner. It is to be hoped that a false ceiling of muslin, stretched from wall to wall, or some other mode of moderating the light will be adopted by the British Commission.

The retrospective gallery is in nearly the same stage of advancement as the preceding, and in the French portion cases and stands are already being got into place here and there. The entrances of the compartments of this gallery are being fitted with solid doors, which run upon rods, and can be firmly secured by lock and key, so that this rich collection will at night require no watchman, and yet be perfectly safe from depredation.

Within these galleries is the central garden, with its terrace and broad verandah all round. The face of the wall towards the garden has been plastered, the upper portion being decorated with a frieze of red marble, relieved by green marble and some slight ornamentation over the doors of the principal avenues. The verandah is quite finished, with the exception of the last touches of the painter.

It may be mentioned that in the French department the classes are all painted upon the pillars in the industrial galleries, while in the other portions of the building the names of the various exhibiting countries are exhibited over their locations. The radial avenues, as well as the concentric passages, are being covered, experimentally, with a white awning, with a coloured scalloped border, which has a very good effect.

Quitting the building we come to the alimentary class under the great *marquise*, or verandah, which encircles its outer iron wall. The fronts of cafés and restaurants on the French side are fixed in their place; a space is being prepared for the medical attendants, and the terrace or promenade under the verandah is being cemented. It is to be hoped that arrangements for refreshment will be made here for the exhibitors and others during the arrangement of the contents of the exhibition. The Russian restaurant is also in hand.

The Imperial commission has just taken possession of its rooms in the large house built for the accommodation of the executive officers and juries.

In the garden, the royal pavilion of Great Britain is rising rapidly on the spot opposite to the Oriental building erected for the Emperor of the French; it is a solid construction of stone, relieved with red bricks, having three sharp pointed roofs, one transverse and two longitudinal, and containing three apartments, a large one in the rear and two smaller ones in front. Not far from the royal pavilion is the English boiler house, with a noble chimney shaft; the latter is finished, as well as the foundations, but not the superstructure, of the former.

A very useful feature of the arrangements is a covered way, which leads from the railway station just beyond the limits of the grounds to one of the side doors of the building itself, so that all who arrive by rail will be under shelter the whole way; this covered way is nearly finished, and will shortly be connected with the entrance by a vestibule. On the other side of the building is another large covered way for carriages to pass under and set down their occupants.

Speaking of railways, it may be mentioned that an iron tramway for the service of the exhibition is now being laid round the building, inside as well as out-

side, with a branch leading to the special exhibition railway, which will communicate with all the main French lines.

The arrangements for the horticultural exhibition and the great aquariums, as well as those of the various commissions, are being carried out steadily, but it will be more convenient to speak of these in a future number.

Beyond the exhibition grounds, the steel bridge, which crosses the opening made in the quay, is completed; a large and convenient landing place is being formed for those who arrive by water, and who may enter the grounds of the exhibition either by the way beneath the bridge or by the main entrance in the quay. On the right and left of this landing place, but on a level with the quay, two large restaurants have been erected, and one of these will, it is said, be under the direction of two well-known English caterers.

POPULAR EDUCATION IN GERMANY AND SWITZERLAND.

The following is a further communication from Mr. Joseph Kay to the *Manchester Examiner and Times*, in addition to the one which appeared in the *Journal* for the 11th January:—

Will you permit me to conclude the slight sketch I have offered you of the progress of the education of the people of Western Europe, by describing shortly what the people themselves are doing for the education of their children in the purely democratic cantons of Switzerland.

But let me first remind your readers, that even in those German states in which the greatest progress has been made, the work of national education has been earnestly commenced only since 1820, when these countries were beginning to recover from the terrible consequences of the Bonapartist wars.

Prussia and Saxony were the first to treat the education of the children as a national duty. They were the first to devote the power and the resources of the state to the serious promotion of their work.

They have done much more for its development than any other German state. But even Prussia and Saxony only commenced this work after 1820, and one great motive which induced the Prussian government to do so was the desire to improve the mental and physical condition of the classes from which the ranks of the army were mainly recruited, and so to render the nation better fitted to contend with its powerful neighbours. How wise this policy was the war of last year has shown.

The other German states slowly followed the example of Prussia and Saxony. All the principal states have now put these laws in force, but in some, as in Hanover and Bavaria, the work has been too recently commenced to allow us, as yet, either to look for great results or even to expect that the effects of the previous state of ignorance and neglect have been entirely overcome.

In Prussia and Saxony, however, one-sixth of the whole population is under the care of educated teachers.

In Prussia alone, in the year 1861, there were:—3,096,546 children in regular daily attendance at these schools; 25,969 primary schools, many of them containing five or six class-rooms; 46,227 teachers, all of whom had been specially trained for their duties. These results had been obtained between the years 1820 and 1861.

But, remarkable as these statistics of the great German kingdom are, it is even more interesting to observe what is being effected in Switzerland, because the governments of the 22 cantons of that country are the purest possible forms of democracy. All the adults vote in the election of the members of the cantonal governments of the federal parliament. Nearly all the land belongs to

the peasant farmers. There are scarcely any great proprietors. There is no titled class. There is no state church.

I merely mention facts. I am not arguing in favour of democracy. I want to show what the people themselves have done, under such a state of political circumstances, for the education of all the children of the nation.

Up to 1832 the cantonal governments were more or less oligarchical, or under the influence of a small wealthy class. About 1832, the old and more aristocratic forms of government were overthrown, and the present purely democratic system was substituted.

Now, the great development of the education of the people in Switzerland began in 1832, after the overthrow of the more aristocratic forms of government. And it is a curious fact, that since the Swiss people have actually governed themselves, they, the most purely democratic people in the world, have done more for the education of all the children and youth of the nation than any other country in the world.

But here again it is necessary to remind your readers that the inhabitants of some of the cantons are Protestants and of others Romanists. The Romanist cantons did not commence the work of national education in any earnest spirit until a few years ago. They have not, therefore, made nearly so great a progress as the Protestant cantons. But now, both Romanist and Protestant cantons have put in force the laws I am going to describe.

Every Swiss parent is obliged by law to satisfy the local authorities that his children are being properly educated, either at home or in some school of the parents' selection, from their fifth to the end of their fourteenth, and, in some cantons, to the end of their sixteenth year. The Swiss consider the proper care and education of the young to be a matter of such vital importance for the best interests of the nation and of the people themselves, that they are most rigorous in the strict enforcement of these laws. In the best educated cantons no children are neglected. The physical, moral, and religious training of all—even the poorest—are most carefully fostered and watched over by the State.

In the manufacturing districts, the children are allowed to begin to work in the mills at the age of twelve or thirteen, on condition:—1. That they obtain from the school inspector a certificate that they are able to read and write. 2. That they continue to attend the school classes a fixed number of hours every week, until the completion of their 15th or 16th year. The local authorities are, as I mentioned in a previous letter, empowered:—1. To raise the school rate. 2. To provide schools, teachers, and play grounds. 3. To maintain and furnish the school buildings. 4. To provide all necessary apparatus. 5. To pay the teachers' salaries. 6. To provide houses and gardens for the teachers. 7. To supply the children of poor parents with decent clothing for school attendance. 8. To warm and light the schoolrooms. 9. To pay the school fees for poor children.

All these matters are subjects of distinct legislative provisions.

The town schools often contain five or six class-rooms, each superintended by an educated teacher. In these so-called primary schools, the children of nearly all classes of society begin their education. I remember being sent by the mother of a rich Geneva banker to see his young children in one of the class-rooms of a village school in the canton of Vaud. Besides these primary schools, the Swiss establish in each town one or more of what they call secondary schools. In these, a superior classical, mathematical, and scientific education is given by professors from the universities. In these secondary schools the children of the richer classes continue their education. But even in them, places are provided for poor boys who distinguish themselves in the primary schools, and who wish to educate themselves, either to be teachers or for some business requiring scientific knowledge.

I have seen in these secondary schools in Switzerland

the clever sons of working men being educated at the expense of the country in science, mathematics, drawing from models, designing, &c., in the same classes with the children of richer parents.

All parties in Switzerland, Romanist and Protestant, rich and poor, combine—

1. To save the children from the streets. 2. To train them up in clean and healthy habits. 3. To teach them the principles of their parents' religion. 4. To give them as good an education as can be imparted between the ages of five and sixteen. 5. To aid clever children to continue their education after leaving the primary schools, if they show any peculiar ability.

But to do all this, it was absolutely necessary to train good teachers. For this purpose the people of these democratic cantons have taxed themselves to establish and support 13 admirable colleges for the education of teachers.

No person is allowed to officiate as a teacher in Switzerland until he has obtained—

1. A certificate of education from the examiners appointed by the government of his canton. 2. A certificate of character from his religious minister. 3. Certificates from the professors of the college where he was educated, of his fitness to be entrusted with the education of children.

I visited the teachers' cottages at Lausanne, on the Lake of Constance, in Argau, in the Canton of Berne, at Hofwyl, at Fribourg, St. Gall, Zurich, and Solleure.

The students for the thirteen colleges are selected from the candidates for admission. The education given in the colleges comprises—

1. History. 2. Geography. 3. Mathematics. 4. The elements of the physical sciences. 5. Music and singing. 6. Drawing. 7. Farming or gardening.

To nearly all these colleges are attached farms and gardens. The students work like peasants on these lands, under the guidance of skilled men. They learn how to cultivate and manage a farm, how to cultivate a kitchen garden, and how to prune trees. This work invigorates their frames, accustoms them to humble toil, makes them understand the labours and habits of the peasant farmers, cultivates in them a sympathy for the people among whom they will have to live and labour, and prevents the high intellectual training of the college from unfitting them for their humble duties in the village. Besides this, they thus acquire in many of these colleges a scientific knowledge of the business of the people among whom they will have to spend their lives. This enables them to be useful to the parents of their children, to win their respect, and to disseminate among them knowledge which is advantageous to them and the nation.

The students remain in these colleges two or three years. The expenses of their board and education are borne by the government. The life in the college is so arranged or ordered as to prepare the young men for their humble lives in the villages. The young students are, therefore, during their life in the college, accustomed to simple fare, to the dress of a peasant, and to humble and arduous duties, while they are receiving a high intellectual training. They are made to clean the rooms of the college, to take care of the sleeping rooms, to cultivate and prepare the vegetables for the meals, to serve by turns at the tables, and to work like labourers upon the farm attached to the college. The consequence is, that, when they go into the villages as teachers, they find themselves thoroughly accustomed to the humblest duties and associates. They find their work in the villages less laborious than their life in the college, and this makes them contented with their position.

The teachers in Switzerland are the helpmates of the religious minister, the guardians and trainers of the children, and the friends and enlightened associates of the farmers and peasants. If this is true, do you wonder that the Swiss are willing to lavish such large funds upon the training of the teachers of their children?

In the canton of Berne, which has a population of between 400,000 and 500,000, the democratic government had provided three of these colleges. The most interesting college was the one which was managed, at the time of my visit, by that good and earnest man Vehrli.

My brother, Sir James Kay-Shuttleworth, was the first to introduce this institution to the knowledge of Englishmen. After he had been there, I visited Vehrli several times. About a mile from the gates of the old city of Constance, in the canton of Thurgovie, upon a rising ground overlooking the great inland sea, stands an ancient turretted mansion, which was formerly the palace of the abbot of a vast convent, the buildings of which still remain.

The democratic government of the little canton of Thurgovie had set apart the abbot's palace, with a good farm surrounding it, for the purpose of a college for the education of the teachers of the canton. Such a change had that old magician—Time—effected in the uses to which the old palace was devoted. It was all furnished in the simplest possible manner. The chairs and tables were of deal. The linen was coarse, but clean. The rooms, so far as the furniture was concerned, might have been the rooms of a poor peasant's cottage. But the books in the class-rooms, the diagrams of the last mathematical lessons chalked upon the blackboards in the lecture-rooms—the maps on the walls—the models—the objects for the scientific lessons—the drawings of the students—the music books—and the musical instruments, all tell the visitor most forcibly that the instruction given to the students formed a strange contrast to the simplicity of their daily life. When Vehrli joined me, he was dressed like a peasant, but his eyes and face told of the intelligence which was presiding over this far-famed institution. The students were in the fields working like farm labourers, under the direction of scientific men. I afterwards saw them preparing the vegetables for the mid-day meal. These young men could nearly all play some musical instrument—the organ, pianoforte, or violin; they could nearly all sing from note, and all those who had been two years in the institution were admirably qualified to take the management of the primary schools.

Vehrli said, "In our college the students do everything for themselves. They clean their own chambers, brush their own boots, clean the knives, forks, and dishes, cultivate all the vegetables, prepare them to be cooked, and serve the meals. But, notwithstanding all this, they work in their class-rooms eight hours every day, and study the Scriptures, history, geography, arithmetic, mathematics, the elements of the sciences, music, and drawing." Close to the College there was a large village school, under the care of an experienced teacher. The students at the College, during their last year's residence, practised teaching in this school under the guidance of the teacher.

Within a few miles of the College were two large agricultural schools, founded and supported by this little canton, where the sons of the small farmers spend a few months every year to learn scientific farming and agricultural chemistry. They were under the management of scientific professors. Farms were attached to them. They were supplied with laboratories, the best agricultural implements, and books.

Throughout Switzerland, a good many of these agricultural schools have been established, in order to spread a knowledge of scientific and economic farming among the people.

But what I want to impress upon those who read this letter is, that the poor peasants and workmen of Switzerland have such a profound sense of the benefits which a good system of training and education bestows, that they do not grudge the great expense of carrying out and perfecting, as far as possible, the system of education which I have attempted so imperfectly to describe.

In Switzerland, it is the people who have most strin-

gently enforced the laws which compel a parent to educate his children. It is the people who bear all the expense of assisting poor parents to do so. It is the people who provide the costly teachers' colleges, who build the schools, furnish them, maintain them, appoint the teachers, pay them, supply them with houses, and support them when superannuated. And so far are the people from murmuring at these regulations, that one of the principal efforts of the democratic governments of these little cantons is, how they shall further develop and perfect the institutions and laws, which have for their object the nurture and improvement of their children.

Do you wonder, then, when I tell you, that in several of the Protestant cantons, one in five, or one-fifth of the whole population, is actually under the care and education of the teachers? Every one in these cantons agrees that the good effects of the schools upon the moral and physical well-being of the people are most marked. The houses are steadily improving. The habits of the people are becoming more and more refined. The health of the younger generations is improving. All who live among them mark the change.

I believe that the workmen and peasants of Prussia, Saxony, and the Protestant cantons of Switzerland are in a better moral and social condition than the workmen and peasants of any other European country. And it is a fact, which I commend to the consideration of your readers, that during the last thirty years more has been done for the education and training of the children in these countries than in any other country in the world.

Nones are left neglected in the streets and gutters. All are trained up in the way they should go. And, certainly, the truth of the wise old saying, is being exemplified in the case of these nations.

Fine Arts.

PORTRAIT MINIATURES.—Photographs from 200 of the most important of the miniatures exhibited in 1865 at the South Kensington Museum are now, under the sanction of the Science and Art Department; published by the Arundel Society. The complete set, with a copy of the official catalogue, bound in three volumes, half-morocco, is sold for ten guineas; a packet of twenty-five portraits, at choice, for one guinea; or a single photograph for one shilling. Specimens may be seen either at the South Kensington Museum, or at the rooms of the Arundel Society, 24, Old Bond-street.

NATIONAL PORTRAITS.—The exhibition of historic portraits, held last year at South Kensington, is put on permanent record by the art of photography. Out of 1,030 pictures exhibited, 964 have, with the consent of the owners, been photographed. The entire collection is issued by the Arundel Society, under the sanction of the Department of Science and Art, in ten volumes, half-bound in morocco, at the price of £62; or a single volume of 100 portraits, at choice, may be obtained for six guineas; or a packet of sixteen portraits for one guinea, or a single portrait for 1s. 6d. Specimens to be seen at Kensington or Old Bond-street. A new and corrected edition, with indexes, of the official catalogue of the late National Portrait Exhibition is announced, also a classified list of all photographs of drawings, paintings, and sculpture issued by the Department of Science and Art. This list, brought down to the present moment, will be of much use; a former catalogue has been out of print for some time.

PHOTOGRAPHS OF PICTURES IN THE NATIONAL GALLERY.—Messrs. Caldesi have for some months been engaged on student-days in making photographs from leading pictures in the National Gallery. Upwards of three hundred plates have been procured satisfactory. It is thought that arrangements may be made for the publication of a complete work on the National Gallery,

consisting of a historic account of the painters, and a critical estimate of the pictures, illustrated by these photographs. The want of such a work has been long felt. Most of the national museums on the Continent have received elucidation in handsome and well-known volumes. Now that the National Gallery contains an epitome of most historic schools, a work which will worthily set forth its treasures would form a valuable contribution to art-literature.

Manufactures.

MANUFACTURES OF VENICE.—Till the end of the year 1847 there were upwards of one hundred different industries in a flourishing state. The glass manufacture alone produced yearly 800,000 kilogrammes of glass and crystal ware. The celebrated paper-mills produced upwards of 2,320,000 kilogrammes, and gave employment to 3,000 workmen. The salt marshes of the Lagoons produced more than 25,000,000 pounds of salt. Upwards of 260,000 pounds of the best wax candles were manufactured yearly. Extensive manufactures of painters' colours were carried on, and yearly furnished 470,000 pounds of white lead. The tobacco manufacture gave employment to 300 workmen and 600 women, and produced the enormous quantity of 23,000,000 lbs. only in cigars. The leather manufacture produced the best morocco, which was exported to the Levant; and in America upwards of 1,000 workmen were employed in the manufacture of gloves. In the arsenal a great number of ships were constructed, and the private shipbuilding yards alone employed 700 workmen. The manufacture of sail-cloth, fez of red cloth for the Levant, passementerie and lace, still maintained for Venice her ancient wealth. Even the ancient industry of masks for the Carnival produced upwards of 100,000 per year, which were exported throughout Italy, Germany, Switzerland, and as far as America. Exquisite articles of jewelry were still manufactured, amongst which may be remarked the little chains that derive their name from Venice, and gave employment to about 200 jewellers. From 1807 to 1847 a quantity of silver and gold, to the value of \$6,440,000 sterling, was coined by the mint of Venice for the Levant. About 5,000 vessels yearly entered the port of Venice. The value of the exports by sea amounted to \$5,720,000, and those by land to £2,800,000. Such was the commercial prosperity of Venice till the close of 1847. Twenty years are already passed, and Venice has with difficulty struggled on. It is to be hoped now that that she will rise again from her sleep, and become once more a great commercial centre.

Commerce.

SUGAR IN PERU.—In Peru, at the present time, the sugar cane is cultivated, and sugar refineries are established upon the best principles, if we may judge by the produce. The refineries furnish a white sugar, of fine quality, in small crystals. The flavour of it partakes more of the date than of the cane. If a like quantity of sugar could be produced on a scale of any magnitude, no doubt a large commerce would arise, although the great distance of the place of production might prevent this article of food from coming into European markets.

SALT WORKS IN FRANCE.—There are now numerous salt works on the French shore of La Manche. The most important working in these parts has been for some time past that of Bouteillas, near Dieppe; it was named in a charter at the end of the 17th century. Now, what remains of the salt marshes upon the French coast occupies a superficial total of 24,248 hectares, distributed over the coasts of the Manche, the ocean, and

the Mediterranean. The cost price of the salt averages a franc for 100 kilogrammes.

KAOLIN.—Cornwall has for some years past done a large and profitable business in china clay, the greater part of which has been raised in the St. Austell district, where several important works are now in progress. There is every prospect, however, of a new district being opened up on an extensive scale in a short time. Fine samples of china clay have been discovered in three parishes, and the ground in various localities is believed to be very rich. Steps are being taken with a view to establish works which would afford employment to a large number of people.

Colonies.

COLONISATION OF VICTORIA.—A colonial journal says:—"It appears from the reports that have been made public lately, that the efforts of the Parliaments and Governments of Victoria, for some years past, have not been very successful in placing a race of yeomen on the soil, although heavy public losses have been endured for that end. None of the modes under which land has been offered to the public seem to have attracted settlers, in any number, who have really become settlers of the soil. Under the system of auction, which preceded that introduced by the Nicholson Act, considerable tracts of land were disposed of, but it was only in isolated districts here and there that the farmer put his hand to the plough. Magnificently-grassed lands, which would carry good crops of cereals under any ordinary course of farming, remain, year after year, in the same state, pretty to look at but not so charming as if fields of ripe yellow grain alternated with green crops and fallow fields. There were two causes for this state of things. The really good land in the colony, apart from that which may be found good, but is at present heavily covered with timber and almost impenetrable scrub, is too small to attract a numerous body of farmers, who might have worked together for their mutual good. Towns did not exist, except on the coast, or on new rushes in the gold field districts, to furnish markets for produce. The pastoral tenants were content with the natural bush roads, over which their bullock drays travelled easily enough under easy loads, and thus the farmer had no temptation in roads or markets to place land under cultivation, especially while the cheap and convenient highway of the sea enabled the farmers of South Australia and Tasmania to throw their produce into the markets of the gold fields. Scarcity and dearth of labour, uncertainty of seasons, and various other causes, assisted to discourage the farmer. The Amended Land Act has not been much more successful in attracting farmers. It is asserted, on what appears to be good evidence, that taking all the areas together thrown open for selection in and since June last, and they embrace about 4,000,000 acres, not more than a tenth part of the land has passed into the hands of *bona fide* farming settlers."

Obituary.

MR. GEORGE BAXTER, the inventor of oil-colour picture printing, died on Friday, the 11th January, from apoplexy, in his 62nd year. Mr. Baxter was a native of Lewes, and came to London forty years ago. He invented the process of oil-colour printing, and was in some repute as an artist. Among some of his works may be mentioned his miniatures of Her Majesty and the late Prince Consort, and a copy of the Descent from the Cross. He was originally from Antwerp. He received the gold medal for his opening of the "First Par-

ament of Queen Victoria" and the "Coronation." His earliest original production is the miniature drawing of the baptism of the Prince of Wales. Mr. Baxter was formerly a member of the Society of Arts.

VICTOR COUSIN, whose philosophical works have occupied great attention during the last thirty years, died recently. He was the son of a Parisian watchmaker, and was entirely the architect of his own fortune. He held for a considerable time the historical chair in the University of Paris, and was a member of two branches of the Institute, the Academy of Moral and Political Science, and the Academy of France. M. Cousin's library was celebrated, and estimated to be worth a million of francs; this is left by will to the Sorbonne. The intention of the deceased was known some time since, and in recognition of the fact, and as a tribute to his reputation, the government recently named a new street after him, Rue de Victor Cousin. M. Cousin resided at Cannes, where he died.

MR. JOSEPH GUY, author of the well-known Spelling-book, and of various elementary educational works on history, geography, and various branches of science, died on Saturday, the 19th inst., at the age of 83.

CAPTAIN HUISH, well known from his long connection with the London and North-Western Railway Company, died on Friday, the 18th inst. Captain Huish was deputy-chairman of the Electric and International Telegraph Company.

Notes.

THE ORPHEONISTS.—It appears from official reports that there are now in France 3,243 musical societies called orpheonists, consisting of 90,532 active members and 56,967 honorary members, altogether 147,499 persons. The greater part of these choral societies are under the direction of a professional teacher. The Departments du Nord and des Bouches-du-Rhône are those where the choral societies are the most numerous.

STORM SIGNALS.—It appears that the underwriters, shipowners, and members of the mercantile marine service in Liverpool have expressed the greatest dissatisfaction with regard to the cessation of the storm warnings which were inaugurated by the late Admiral Fitzroy, and have adopted a memorial to the Board of Trade, asking that they may be re-established at once.

RUSSIAN TELEGRAPHS.—The city of St. Petersburg will soon be provided with a telegraph which will convey the messages of the Government and those of private persons from all parts of the city, and even from some of the most frequented suburbs. Already the wires are laid, and the stations are now being organised; fourteen will be provided for the city and two for the environs. A message of twenty words will cost forty copecks; stamped sheets, on which the message can be written, and adhesive stamps, will be sold at all stations.

MINIATURE COINAGE FOR THE ISLAND OF MALTA.—It appears by the *Engineer* that "a coinage of a very peculiar and curious character is at present in course of production at Her Majesty's mint, consisting of minute pieces of money, each of which is intended to circulate among the inhabitants of Malta at the nominal value of one-twelfth part of our English penny, or one-third of a farthing. Of these infinitesimal specimens of British mintage no less than half-a-ton weight, or a little over half-a-million of coins, have already received their impressions, and they will be speedily forwarded to their destination. Apart from their remarkably small size and value the new coins possess characteristics which make them interesting. For example, the portrait of the Queen, which forms the main ornamentation of the obverse, is said to be the most correct likeness of Her Majesty that has ever been transferred to metal discs. It is the result of a very recent sitting accorded

to the artist, Mr. Leonard C. Wyon, who also engraved the die. The 'one-third farthing' is composed of metal analogous in its nature to that of which our own subordinate coinage is made, namely, a mixture of copper, tin, and zinc, in the respective proportions of ninety-five, three, and two parts in the hundred. This forms an exceedingly hard composition, well calculated to resist the wasting effects of attrition; and the pieces when newly struck have a rich, golden colour. The coins are five-eighths of an inch in diameter, and exceedingly thin. In fact, they might be termed metallic wafers, for it actually requires 480 of them to weigh down 1 lb. avoirdupois, and thirty of them to balance an ounce. In addition to the royal portrait, which is laureated and uncrowned, and which shows the hair plaited at the back—the obverse bears the legend, 'VICTORIA D. G. BRITT. REG. F. D.', within the engrailed edge, forming the frame of the picture, so to speak. The reverse represents a wreath composed of two sprays of the British oak, and between which, at their upper terminal points, is placed an imperial crown. Within the wreath, in straight lines, appear the words, 'One-third farthing,' and the date. The protecting rim, considering the paucity of material for raising it, is boldly developed, and thus the coin gains a finished appearance, contrasting favourably with the wire-edged pieces of money of far higher value and greater pretension. It is difficult to imagine, in these times of dear provisions and heavy rates and rentals at home, what articles the Maltese may be able to purchase for the 144th part of a shilling, but as figs, honey, oranges, and fish are abundant in the markets of Malta, perhaps some of these delicacies are obtainable at that homoeopathic price. 'Change for a sovereign' in the new coinage would place the receiver in the possession of no less than 2,880 distinct pieces of hard cash. It remains only to be said that so far as minting operations are concerned in the execution of this especial coinage, they are both more numerous and more costly than those required in the production of sovereigns. Standard gold is far more ductile and 'kind' than bronze, and therefore more easily manipulated. Literally it costs less to make a sovereign than a Maltese wafer coin, notwithstanding the marvellous disparity in their respective values."

Correspondence.

MERCHANT SEAMEN.—SIR,—With reference to a proposal that was made at the discussion upon Capt. Toynbee's paper last Wednesday evening, that either another evening should be appointed to continue the discussion, or a committee formed to consider the state of the law with regard to merchant seamen, and as it may be inconvenient to fix another evening before the question is brought before Parliament, great good might be done were a committee formed to report to your council upon the subject. The point that struck me most at the discussion, and even in Capt. Toynbee's paper, was that the Merchant Shipping Act, which is very voluminous, appeared to be so little known. There is scarcely a point that was touched upon that it does not provide for, so that it is not an alteration in the law that is needed to effect all the improvement that is sought, but merely some changes in the mode of carrying out the provisions of the Act; and one clause permits the Board of Trade to make alterations and amendments even in the Act itself. I mention this for I fear that we should not readily get a better Act for the sailor if a new system of legislation is begun. It is from the Board of Trade and not from Parliament that most good can be got by proper representations. In the few observations I made (which are put down to the Rev. John Scott), I stated that the worst evil sailors had to contend with was that there was one particular spot appointed by Government at which

sailors receive their pay in London (irrespective of the sailors' homes), therefore the crimps and others are guided to their prey. The sailors are anxious that this should be done away with, and that they might receive their wages in the presence of a shipping master on board their ships. The Act admits of this, but it is never the practice; indeed the Act is most carefully framed for the good of the sailor, and yet for doing justice to the shipowner. I need not enter into further particulars, but, both as a member of your Society, and as one in constant communication with all classes of sailors, I shall be glad to be of any service to the committee if there is one formed. I may state that previous to taking holy orders, and undertaking the work here among sailors at the request of the bishop, I had many years' experience with ships and sailors as a partner in one of the oldest houses in China, where I was interested in many fine ships, and I have been both a shipowner and underwriter.—I am, &c., JOHN SCAMER.

Journal of the Society of Arts.

FRIDAY, FEBRUARY 1, 1867.

Announcements by the Council.

ORDINARY MEETINGS.

Wednesday Evenings at Eight o'clock:—

FEBRUARY 6.—The following subject for discussion will be introduced by Mr. HENRY COLE, C.B.:—"On the existing legal regulations in reference to the Cab Fares in the Metropolis, and their effect in rendering the Vehicles inferior to those provided in other European Capitals and the large Municipal Towns of this Country." On this evening Sir Richard Mayne, K.C.B., Chief Commissioner of the Metropolitan Police, will preside.

FEBRUARY 13.—"On Artificial Illumination." By D. N. DEPRINS, Esq.

FEBRUARY 20.—"On the Water Supply of London as it affects the Interests of the Consumers." By THOMAS BEGGS, Esq.

CANTOR LECTURES.

A course of Six Lectures "On Pottery and Porcelain," illustrated by specimens of various manufactures, and by photographs and diagrams, is now being delivered by William Chaffers, Esq.

LECTURE III.—MONDAY, FEBRUARY 4.

FAYENCE.—France, Spain, Portugal, Russia, Sweden, Denmark, &c.

GRES OR STONE WARE of Germany and Flanders. DELFT WARE, &c.

LECTURE IV.—MONDAY, FEBRUARY 11.

ORIENTAL PORCELAIN.—China, Japan.

LECTURE V.—MONDAY, FEBRUARY 18.

EUROPEAN PORCELAIN.—Italy, Germany, France, Holland, Belgium, Russia, Poland, &c.

LECTURE VI.—MONDAY, FEBRUARY 25.

ENGLISH POTTERY AND PORCELAIN.—Early History, continued to the beginning of the 19th century.

The lectures commence each evening at eight o'clock, and are open to members, each of whom has the privilege of introducing one friend to each lecture. Tickets for this purpose have been issued to each member.

ART-WORKMANSHIP AND EDUCATIONAL PRIZES.

The Court of the Worshipful Company of Goldsmiths have passed the following resolution:—

"That the sum of £25 be given to the Society for the Encouragement of Arts, Manufactures, and Commerce; £15 thereof to be applied by the said Society as a prize, or prizes, for the encouragement of workmen in the precious metals, and £10 to be applied as prizes of £5, £3, and £2 respectively, to be awarded, at the Society's Educational Examinations, to the three candidates who, being employed on works in the precious metals in any part of the United Kingdom, shall obtain from the examiners

the first, second, and next highest number of marks, such prizes to be distinguished in each case as "The Goldsmiths' Company's Prizes."

It will be remembered that donations for similar objects have been received in this and in former years from the Worshipful Companies of Salters, Plasterers, Coach and Coach Harness-makers, and Clothworkers; and the Council are gratified by this further proof of the desire of these important Guilds to co-operate with the Society in its efforts to encourage Art-Workmanship and general Education.

The above Educational Prizes are offered to candidates at the Society's Examinations, to be held in April next (see below); the Art-Workmanship Prizes to competitors in the next Art-Workmanship Competition, particulars of which will be duly announced.

EXAMINATIONS, 1867.

In addition to the prizes announced in the Programme of Examinations, the following are offered:—

The Worshipful Company of Coach and Coach Harness Makers offer a prize of £3 in Freehand Drawing, and a prize of £2 in Practical Mechanics, to the candidates who, being employed in the coachmaking trade, obtain the highest number of marks, with a certificate, in those subjects respectively.

The Worshipful Company of Goldsmiths offer three prizes—of £5, £3, and £2 respectively—to the three candidates who, being employed on works in the precious metals in any part of the United Kingdom, shall obtain from the examiners the first, second, and next highest number of marks, such prizes to be distinguished as the "Goldsmiths' Company's Prizes."

ART-WORKMANSHIP PRIZES.

The works sent in competition for these Prizes are now placed in the Society's Great Room for the inspection of members and their friends.

SUBSCRIPTIONS.

The Christmas subscriptions are due, and should be forwarded by cheque or Post-office order, crossed "Coutts and Co.," and made payable to Mr. Samuel Thomas Davenport, Financial Officer.

RATISBON CATHEDRAL.

M. Schubarth, a corresponding member of the Society, has forwarded to the Secretary an interesting series of Photographs, illustrating the progress of the restoration of Ratisbon Cathedral.* He writes as follows:—

Ratisbon, Bavaria, 31st December, 1866.

SIR,—Feeling extremely thankful for the great kindness which the Society of Arts has shown me by sending

me every week, since 1851, a copy of its *Journal*, I have always regretted not to have had it in my power to be serviceable to the Society. All that I have been able to do is to forward the *Journal* to some friends of mine, and to direct their attention to its very valuable and interesting contents, which were always appreciated by them. It has occurred to me that perhaps it would not be uninteresting to some members of the Society to receive some information concerning an important work, which, some years ago, was undertaken in this town of Ratisbon, namely, the restoration, or rather the completion, of the old cathedral. I take the liberty of forwarding to you, by a friend of mine, a parcel containing several photographs, representing the Ratisbon Cathedral in its former state, and the progress made from year to year in completing the building, especially the towers. I enclose some particulars of the cathedral, and a description, made by the present architect himself, of what has been done by him up to this time. For the convenience of those who are not familiar with the German language, in which this description is written, I have attempted to translate it into English, and I hope that the translation, though destitute of elegance, will at least be intelligible. I conclude, sir, by requesting you will have the kindness to present to the Society of Arts these objects, as a token of my gratitude for the favours shown to me.—I am, &c., B. F. SCHUBARTH, Councillor of Commerce, Commissioner for Bavaria at the Great Exhibition of 1851.

The Photographs referred to are now at the Society's house for the inspection of members.

Proceedings of the Society.

CANTOR LECTURES.

"ON POTTERY AND PORCELAIN." By W. CHAFFERS, Esq.

LECTURE II.—MONDAY, JANUARY 28.

The subject of Mr. Chaffers' second lecture was the maiolica work of Persia, Spain, and Italy, and it was amply illustrated by specimens of all the principal manufactures, kindly lent to the lecturer for the purpose by Mr. J. Henderson, Mr. F. Slade, Dr. Diamond, Mr. H. G. Bohn, and Mr. Durrant. The marks and monograms used by the various potters and ceramic artists of Italy in the 16th and 17th centuries were arranged on the walls. The lecture was opened by a short history of maiolica in general, and its leading characteristic, the stanniferous enamel glaze, was fully described. This distinguishing feature is a covering of a thick, opaque, white glaze, resulting from the introduction of the oxide of tin, which, from the dissemination of its particles, imbedded, uncombined, amid the glass, renders the substance opaque, and not only covers the dingy colour of the clay, but forms a fine colourless ground for the painter. All the manufactured pieces of pottery, after the first baking, were covered wholly or partially with this glaze, diluted, so that the water was absorbed by the biscuit, leaving the enamel in a state of powder on the surface; on this crude and gritty medium the painting was applied, and was necessarily produced by single strokes of the brush, no corrections being possible. It was then placed in the kiln again, to melt the glaze and fix the colours. The metallic lustre colours found especially upon the pieces painted at Gubbio were next described. Mr. Chaffers, in speaking of the Hispano-Moorish period, commencing from the 13th century, when the Alhambra was erected by the Moors, gave a history of the celebrated vase of the Alhambra, the finest specimen of Moorish fayence known, made probably at Malaga, early in the 14th century. Three vases full of treasure were discovered at Adarves, in Spain, by the Marquis de Mondejar, in the 16th century. With the gold found in them he laid out a garden on the spot

in which the vases were placed; but, being exposed to public view unprotected, they sustained considerable injury by being rubbed and handled, and eventually one got broken; henceforth every traveller who visited the garden took away a fragment as a memento, until all of it was gone. In 1785, two were yet preserved intact; but about the year 1820 a second disappeared altogether, and of three only one is extant. It measures 4 feet 7 inches in height. The colours of the decoration are a pure blue enamel, surrounded by a yellow lustre on white ground, ornamented with scrolls and Arabic inscriptions, with two antelopes in the centre. The pottery of Maiorca—from which place the term maiolica was derived—Valencia, Malaga, Manises, and other Spanish *fabriques*, came next under review. The richly-enamelled ware of Persia was then described, and reference was made to its early origin, from the fact of many plaques and discs being found, decorating churches in Italy which were built in the 12th and 13th centuries. Faenza, the best known and most celebrated for its productions, gave to France the name by which they have to the present day distinguished their enamelled pottery, as Maiorca in Spain did to Italy, and Delft in Holland to England. The favourite decoration in the 16th century was arabesques and grotesques in blue camaïeu on yellow ground, or *vice versa*; the reverses of the plates having concentric circles, or spiral lines in blue, or some of blue and yellow. Caffagiolo, established towards the end of the 15th century, produced maiolica of a very artistic character, and many valuable examples have been preserved to our time. The most ancient dated pieces are in the collection of Baron Gustave de Rothschild, 1507 and 1509; the latest date is 1590. A great peculiarity of this ware is the deep blue back ground on many of the specimens. Some well known plates of this *fabrique* are in the South Kensington Museum, as the Maiolica Painter in his Studio; a portrait of Pietro Perugino; a Procession of Leo X., composed of more than fifty figures; the St. George of Donatello, &c. To these succeeded Forli, Rimini, Viterbo, Ravenna, Traversa, Pisa, and other manufactories of secondary importance. Siena was an important *fabrique*, and many highly-finished enamelled tiles still remain *in situ* in the Church of San Francesco, and the Biblioteca, and the Petrucci palace supplied the South Kensington Museum with several hundred examples, some dated as early as 1509. The manufacture was continued during the 18th century. The Pesaro maiolica is generally known by a yellow lustre and blue ground, with imbricated borders, many having portraits of ladies and gentlemen, their names inscribed on scrolls—but there are many other varieties. Castel Durante was a very extensive manufactory; a large trade was carried on in drug vases. Being adjacent to Urbino, many of its productions are similar and often ascribed to that *fabrique*. In 1635 the name was changed to Urbania, in compliment to Pope Urban VIII. The Chevalier Piccol Passio, director of a bottega at Castel Durante about 1550, wrote a treatise on the art of making and decorating maiolica. This manuscript is preserved in the art library of the South Kensington Museum, and is a most interesting work, being illustrated with pen-and-ink sketches of all the details of manufacture, patterns of the ware, and the prices at which they could be obtained; the names of the principal forms of the vessels are given, and contemporary *fabriques* frequently alluded to. Urbino was the most celebrated of all the Italian manufactories, and many of the names of the artists are well known from their signatures on the pieces they decorated. The most noted is Francesco Xanto Avelli da Rovigo, who usually followed the designs of Raffaele and other great masters, seldom, however, adhering strictly to the grouping of the originals. He also painted subjects from Virg Ovid, Ariosto, and other poets. On many of his pieces are found touches of the rich ruby and gold metallic lustres, which were evidently applied after the vase had been painted and baked at Urbino; it was then sent

Gubbio to be lustrated, where the process was kept profoundly secret. Another celebrated ceramic artist of Urbino was Orazio Fontana, whose best works were referred to by the lecturer. The family of Patanazzi also, some of them painted maiolica at the early age of twelve. Gubbio is known to us especially by the works of Maestro Giorgio, who seems to have monopolised the rich ruby and yellow lustras. Mr. Chaffers exemplified the value which is attached to the rare productions of this artist, by quoting the high prices many of them have realised. A plate, painted with the Three Graces, was sold for 400 guineas, and many others were cited. The *fabriques* of Deruta, Ferrara, Turin, and Venice, in the 15th century, and those of a later period in the 16th and 17th centuries, as Savona, Genoa, and Castelli, were next described and their peculiarities pointed out.

In conclusion, Mr. Chaffers spoke of the Santa Casa at Loreto, where there are still preserved upwards of 350 maiolica vases, brought from the Spezieria, or Medical Dispensary, attached to the palace of Urbino. The last Duke of Urbino, Francesco Maria II., in his dotage had abdicated in favour of the Holy See, and at his death, in 1631, his heir Ferdinand de Medici removed the more ornamental pieces to Florence. The vessels from the Spezieria he presented to the shrine of our Lady of Loreto; these did not consist alone of drug vases, but among them were many choice pieces and some statuettes, which became the envy of more than one of the crowned heads of Europe. A curious piece of maiolica, inscribed with the words *Con polveri di Santa Casa*, Mr. Chaffers explained as having been made within the precincts of the sanctuary, with the dust shaken from the dress of the virgin and swept off the walls, mixed with clay and formed into cups or bowls, painted with the virgin and child and a view of the Santa Casa, and in this form preserved by the faithful as tokens of their visit to the shrine.

EIGHTH ORDINARY MEETING.

Wednesday, January 30th, 1867; Sir THOMAS PHILLIPS, Q.C., F.G.S., Chairman of the Council, in the chair.

The following candidates were proposed for election as members of the Society:—

Atkins, Francis Henry, 62, Fleet-street, E.C.
Barlow, James, Greenethorn, near Bolton.
Burgess, A. W., 107, Strand, W.C.
Chaffer, Thomas, 14, Great Howard-street, Liverpool.
Greenwood, Thomas, 28, Waterloo-road, Cheetham, Manchester.
Hayes, Henry, 31, College-green, Dublin.
Richardson, William, Hartford Works, Oldham.
Whitehead, Peter Ormerod, Rawtenstall.

The following candidates were balloted for, and duly elected members of the Society:—

Agnew, William, Manchester.
Angier, Samuel Haynes, 72, Cornhill, E.C.
Bargawanath, J. P., 153, Upper Thames-street, E.C.
Bingham, Reuben, 1, John-street, St. James's-sq., S.W.
Bonnor, George, F.R.G.S., 42, Queen's-gate-terrace, Kensington, W.
Bradfield, J. E., 2, Strand, W.C.
Chaffers, William, 19, Fitzroy-square, W.
Clard, Richard Sommers, Rougemont, Exeter.
Coley, James Logan, F.G.S., 50, Lansdowne-road, Kensington-park, W.
Cock, Sir John, Bart., F.R.S., 15, Lombard-street, London, E.C., and High-Elms, Farnborough, Kent.
Cotton, Thomas John, 79, Long-acre, W.C.
Crawford, Edmund K., New-hall, 41, Old Hall-street, Liverpool.

Ommanney, Rear-Admiral Erasmus, F.R.G.S., F.R.A.S., 6, Talbot-square, Hyde-park, W., and United Service Club, Pall-mall, S.W.

Paine, Thomas, Banbury.

Pearce, J. D. M., A.M., Craufurd College, Maidenhead.

Ramsden, J. C., Busbridge-hall, Godalming.

Seaton, John Louis, 93 and 95, Hampstead-road, N.W.

Show, James Jesse, 2, Hill-road, St. John's-wood, N.W.

Samerton, The Viscount, Roche-court, Salisbury.

Thomson, John Reid, 18, Highbury-place, N.

Ward, John, 107, London-wall, E.C.

The Secretary then read the following—

REPORT OF THE JUDGES ON THE ART-WORKMANSHIP COMPETITION.

To the Chairman and Council of the Society of Arts.

January, 1867.

GENTLEMEN,—It is very gratifying to be enabled to recognise that the culture directed by your Society to the improvement of the Art-workman in so many departments of skilled industry, is at length bearing good fruit. Both in quantity and quality, the objects now exhibited in competition for your valuable prizes, surpass those contributed in any previous year. The most marked progress is shown in the class of hand-wrought metal work, more especially in iron. To two Art-workmen in this class—Mr. G. Page, of Clerkenwell, and Mr. W. Letheren, of Cheltenham—we have without hesitation awarded your prizes of £10 each; to the former for a reproduction of the celebrated Martelli bronze mirror case, in sheet iron, *repoussé*; and to the latter for an excellent panel for a screen, a specimen emulating the fine old smith's work of the fifteenth century. To the former we would also recommend should be given the special prize, known as "the North London Exhibition Prize," he having produced the object which we consider manifests in the highest class the most skilled workmanship in the whole display. In Mr. Page's case we reward not only excellence but novelty, since we have not heretofore observed any such indication of power on the part of an English Art-workman to compete with what has been hitherto almost exclusively produced in this most difficult branch of industry in France and Spain.

After dwelling upon the admirable work shown in the intractable metals, iron and brass, it would be unfair to pass in silence over two specimens of carving in wood, which possess remarkable merit, viz., the picture-frame, produced by various highly-skilled workmen, under Mr. J. H. Wyatt, of Dean-street, Soho, and the head of "Autumn," in satin-wood, by Mr. G. F. Bridge, of Westminster. The former is no less excellent as a specimen of gilding than of wood-carving; and the latter, though small, is still sufficient to display the rare dexterity of the artist.

There is one peculiarity of this Exhibition as compared with those of former years, viz., the liberty given to artisans to exhibit works after other designs than those prescribed in the classes enumerated in the first section of the programme. Many have availed themselves of this relaxation in the conditions, and highly creditable works have been sent in, of which Mr. Letheren's panel for a screen above alluded to, is the best. It is to be hoped that the promise held out by the merits of many of the objects shown this year in this section may mature in future years into an exhibition of powers of meritorious origination as well as of perfect workmanship. The Society is to be specially congratulated upon the institution of this section, and upon the results of its action in this respect.

While upon this subject, we would submit the propriety of changing the models given to the competitors, if not every year, at least more frequently than has been the practice heretofore. Any such frequent variation would stimulate the Art-workmen to fresh exertions,

would prevent the apparent monotony in the Exhibitions from season to season, and would certainly relieve the labours of the adjudicators, who are frequently apprehensive of rewarding in one year the very same object that had been eclipsed by higher competitors in a previous year.

Finally, we would willingly offer our congratulations on the successful character of the present exhibition, not only to the Society of Arts, but to the body of Art-workmen; whose contributions this year testify a rapid advance in effecting, what we trust may prove, a permanent alliance between beauty and propriety of design on the one hand, and admirable technical execution on the other.

(Signed) RICH. REDGRAVE, }
M. DIGBY WYATT, } Adjudicators.

The following is a list of the works, with the prizes awarded:—

FIRST DIVISION.

WORKS GENERALLY EXECUTED FROM PRESCRIBED DESIGNS.*

1. CARVING IN STONE.—Panel, after chimney piece by *Donatello*, by J. Daymond, Jun., 4, Edward-street, Vauxhall-bridge-road, S. Price £8.—(2nd Prize of £7 10s.)
2. Ditto, Gothic bracket, by E. J. Price £5.—(Prize of £4.)
3. Ditto, by John Edward Daly, 33, Medway-street, Westminster, S.W. Price £15.—(Prize of £3.)
4. Ditto, by John Barker, 4, John-street, Marlborough-road, Chelsea, S.W. Price £12.—(Prize of £6.)
- *5. Flowers carved in Caen stone, by W. H. Holmes, 101, Dean-street, Soho, W. Price £5.—(Prize of £5.)
- *6. CARVING IN MARBLE.—“*Ecce Homo*,” by J. P. F. Jones, 4, Surrey-villas, Nunhead-green, Peckham Rye, S.E. Copies made for £5.
- *7. Baso-relievo, in marble, representing the Arts and Sciences, by the above. Price when finished £20.
- *8. Ditto, in marble, “*Triumph of Christ*,” by Owen Thomas, 66, Harwood-street, Camden-town, N.W. Price £25.—(Prize of £5.)
- *9. CARVING IN STONE.—“*Christ blessing little Children*,” by H. Francis, Reigate-heath, Surrey.
- *10. Ditto, “*First Steps in Life*,” by the above.
- *11. Ditto, specimens of letter-cutting in stone, by the above.
- *12. MODELLING IN PLASTER.—National emblems, arranged by J. Daymond, Jun., 4, Edward-street, Vauxhall-bridge-road, S. Price £8.
- *13. HEAD IN CAEN STONE.—“*Winter*,” by T. Herne, 22, Werrington-street, Oakley-square, N.W.
14. CARVING IN WOOD, after design by *Holbein*, by T. E. Mayle, 33, James-street, Stockwell, S.
- *14a. CARVING AND GILDING.—A Glass Frame, designed and carved by W. M. Holmes, principal part of the Flowers by Mouat (deceased), gilt in double mat and burnished by Messrs. Buchholz, Venning, Chowne, sen., Ettershank, Connor, and Allen; exhibited by J. H. Wyatt, 101, Dean-street, W. Price £230.—(Prize of £10.)
15. REPOUSSÉ WORK IN METAL.—Executed in iron, after the Martelli bronze mirror case at South Kensington, by G. Page, 39, Douglas-street, Northampton-road, Clerkenwell, E.C. Price £20.—(1st Prize of £10; also, North London Exhibition Prize.†)
16. Ditto, by J. S. Nichols, 4, Everilda-street, Hammingford-road, Islington, N. Price £5.
- 16a. Ditto, on silver cup, by X. Y. Z. Price £30.
17. Ditto, on silver, by V. U. (Unfinished.)
18. Ditto, “*Raphael's Three Graces*,” in silver, by Joseph Hakowski, 59, Frith-street, Soho-square, W. Price £20. Copies at £15.—(Prize of £2.)
- 18a. Ditto, “*Three Graces*,” in silver, by X. Y. Z. Price £12.
19. Ditto, “*Three Graces*,” in copper, silvered, by Charles Yerman, 14, Gerrard-street, Islington, N.
20. Ditto, “*Three Graces*,” in copper, by Alexander Dufour, 36, Cleveland-street, Fitzroy-square, W. Price £11.—(Prize of £4.)
21. Ditto, “*Three Graces*,” in copper, by W. Holliday, 14, Nailour-street, Islington, N. Price £15.
- *22. Ditto, Portrait of the late Viscount Palmerston, by the above. (Sold.)—(Prize of £4.)
- *23. Ditto, Group, in copper, “*Abundance*,” after J. F. Eycken, by Thomas James Bowman, 3, Rheadl-terrace, St. Peter's, Islington, N. Price £7 10s.
- *23a. Ditto, “*Raffie-leafage*,” Price £5.
24. HAMMERED WORK IN BRASS.—Adapted for use as a bracket, by W. Mansfield, 72, Bishop's-road, Camberwell New-road, S.
25. Ditto, by E. Millward, 35, Little Clarendon-street, Somers-town, N.W.
26. Ditto, by Albert Edward Millward, 13, New Compton-street, Soho, W.—(Prize of £6.)
27. HAMMERED WORK IN IRON.—Ditto, by Alfred Millward, 35, Little Clarendon-street, Somers-town, N.W.—(Prize of £3.)
28. Ditto, by G. H. Price £5 10s.—(Prize of £2.)
29. Ditto, by James Gwillim, 19, Sidney-square, Mile-end, E. Price £15.—(Prize of £2.)
- *30. Ditto, by the above. Price £20.
- 30a. Ditto, Panel for a screen, by W. Letheren, Lamsdown Iron Works, Cheltenham. Price £20.—(Prize of £10.)
- *31. Ditto, by William Cunliffe, St. Peter's-street, Burnley. Price £5 6s.
- *32. Ditto, Bread-basket, designed by A. W. Blomfield, Esq., architect, for East Sheen Church; executed by T. Winstanley, 7, Stanhope-street, Clerkenwell, W.C. Price £12.—(Prize of £2.)
33. CARVING IN IVORY.—Medallion portrait of *Flaxman*, by J. W. Bentley, 22, Sherwood-street, Golden-square, W. Price £10.
34. CHASING IN BRONZE.—Bust of “*Clytie*,” by Frederick Beech, 52, Great Colmore-street, Birmingham. Price £16 16s.
35. Ditto, by H. R. Batchelor, Jun., 149, St. John-street-road, E.C. Price £14.—(Prize of £4.)
36. Ditto, by T. Nichols, 4, Everilda-street, Hemmingford-road, Islington, N. Price £15.—(Prize of £6.)
37. Ditto, Ornament, after *Goutier*, by R. Reynolds, 15, Oak-village, Kentish-town, N.W. Price £15.—(Prize of £2.)
38. Ditto, Ornament, after *Goutier*, by G.—(Prize of £2.)
39. Ditto, Ornament, after *Goutier*, by H. J. Hatfield, 16, Alfred-street, Tottenham-court-road, W.C. Price £15.—(Prize of £4.)
- *40. Ditto, Group, “*Jacob Wrestling with the Angel*,” by the above.—(Prize of £3.)
- *41. Two miniature frames, raised and chased by the above.
- *42. Ditto, Statuette of “*Caractacus*,” by H. Hatfield, sen., 46, Boleover-street, N.W. Produced for the Art Union of London.—(Prize of £5.)
43. ENGRAVING ON METAL, after arabesques, by G. S. B. Price £3 10s.—(Prize of £2.)
44. Ditto, by G. Berry, 31, Brewer-street, Golden-square, W. Price £4 4s.—(Prize of £6.)
45. —————, by William Rowe, 4, Larkhall-lane, Clap-penham, E. Price £3.

* Those marked with an asterisk (*) are not after the prescribed designs.

† This Prize consists of the interest of £167 7s. 3d. Consols, invested in the name of the Society of Arts, to be awarded by the Council “for the best specimen of skilled workmanship” at the Society's Exhibition.

- *46. Ditto, by Gilles McKensie, Tudor-street, Sheffield.
 *47. Ditto, by the above.
 *48. Ditto, by the above.
 *49. Ditto, on silver cup, by the above.—(Price of £2.)
 *50. ENAMEL PAINTING ON COPPER.—"Madonna and Fish," after *Raphael*, by Frederick Lowe, 18, Wilderness-row, E.C.
 *51. Ditto, "Boy and Doves," after *Raphael*, by Walter J. W. Nunn, 10, Gardour-street, Bromeshead-street, Commercial-road, E. Price £5.—(Price of £3.)
 52. PAINTING ON PORCELAIN.—"Two Children," in *Raphael's* cartoon of "Lystra," painted on a vase, by Edwin Saunders, apprentice. Exhibited by Messrs. Battam and Son, Gough-square, E.C.
 53. Ditto, "Two Children," painted on a vase, by W. J. W. Nunn. Exhibited by Messrs. Battam and Son, Gough-square, E.C.—(Price of £2.)
 54. Ditto, "Two Children," by F. D. Bradley, West-parade, Mount-pleasant, Stoke-upon-Trent. Price 24 4s.
 55. Ditto, "Two Children," by John Slater, Field-place, Stoke-upon-Trent. Price £3 3s.
 56. Ditto, "Two Children," by William Slater, Field-place, Stoke-upon-Trent. Price £3 10s.
 57. Ditto, "Two Children," by William H. Slater, Oak-hill-cottages, Stoke-upon-Trent. Price £5 10s.—(Price of £2.)
 58. Ditto, ornament, by F. D. Bradley, West-parade, Mount-pleasant, Stoke-upon-Trent. Price £5 6s.
 59. Ditto, Ornament, by Alexander Fisher, 5, Clyde-street, Stoke-upon-Trent.—(Price of £3.)
 *60. Ditto, Ornament, plateau in blue, after design by *Maestro Ludovico*, by the above.—(Price of £3.)
 *61. Ditto, Pair of door finger-plates, majolica style, by Miss L. Leila Hawkins. Price £5 6s.—(Price of £2.)
 *62 & 63. Ditto, Circular-plates, subjects from the "Signatura" ceiling, by W. P. Rhodes, School of Arts, Stoke-upon-Trent.—(Price of £2.)
 64. DECORATIVE PAINTING, Ornament, by John Slater, Field-place, Stoke-upon-Trent. Price £3 3s.—(Price of £4.)
 65. Ditto, by A.
 66. Ditto, by Charles Pfänder, 28, Bayham-street, Camden-town, N.W. Price £6 5s.—(Price of £2.)
 67. Ditto, after a picture frame in the South Kensington Museum, by the above, £13 10s.—(Price of £4.)
 68. WALL MOSAICS, after *Bertini* of Milan, by Samuel Cooper, 2, Waterford-terrace North, Walham-green, W.
 69. DIE SINKING, after *Wyon's* "Head of Prince Consort," by W. E. Bartello, 4, Chichester-place, Wandsworth-road, S. Price £15.
 70. Ditto, by J. W. Minton, 9, Royal Mint, E.C. Price £20.
 71. Ditto, by Albert Hences, 3, Egbert-street, St. George's-road, N.W. Price £10 10s.—(Price of £2.)
 72. GLASS-BLOWING.—Exhibited by Dr. Salvati, 431, Oxford-street, W. Produced by Marco Seguso, of Murano.—(Highly commended, but ineligible for a Prize, not having been produced in this country.)
 73. BOOKBINDING.—After an Italian specimen, "Quintus Curtius," by John Jeffrey, 23, Upper Marylebone-street, W. Price £7.—(Highly commended, but ineligible for a Prize this year, the producer having taken the 1st Prize last year.)
 *74. Ditto, Early Florentine style, "Histoire de la Porcelaine," by Louis Gentil, 30, Brydges-street, Covent-garden, W.C. Price £35.—(Price of £5.)
 *75. Ditto, "Œuvres de Louise Labé," by the above. Price £8 8s.
 *76. Ditto, case specimen of Mosaic, by the above, £10 10s.—(Price of £3.)

77. ILLUMINATIONS.—Specimen by Charles Pfänder, 28, Bayham-street, Camden-town, N.W. Price £5 10s.—(Price of £4.)
 78. Ditto, by Miss Mary R. David, 4, Anderson-street, Chelsea, S.W. Price £5 6s.

SECOND DIVISION.

WORKS EXECUTED WITHOUT PRESCRIBED DESIGNS.

WOOD CARVING.—(a.) *Human figure in the round, in alto or in bas relief. Animals or natural foliage may be used as accessories.*

79. "Egeria," by J. W. Gould, 33, Bayham-place, Camden-town, N.W. Price £15.
 80. "Cynthia," by the above. Price £10.
 81. "Autumn," Female Head in satin wood, by G. F. Bridge, 3, Vincent-square, S.W. Price £5 10s.—(Price of £5.)
 82. A Finial carved in oak, by R. Davison, 28, Winchester-street, South Belgravia, S.W.
 83. Original Group in walnut, "Wallace at the Battle of Stirling," by John Lucas, 82, Long-acre, W.C. Price £31 10s.
 83a. Panel in Ebony, "Boy and Moth," by R. Flipping, 67, Charrington-street, Oakley-square, N.W.—(Price of £2.)

(b.) *Animal or still-life. Fruit, flowers, or natural foliage may be used as accessories.*

84. "Dog's Head," by E. Dujardin, 46, Camberwell-grove, S. Price £2.
 85. Panel. "Bird and Flowers," by the above. Price £10.—(Price of £2.)

(c.) *Natural foliage, fruit, or flowers, or conventional ornament, in which grotesque figures or animals may form accessories, preference being given where the work is of an applied character for ordinary decorative purposes, as representing commercial value.*

86. Panel in Lime Wood, by J. S. Booth, 19, Malden-road, Kentish-town, N.W. Price £10 10s.—(Price of £4.)
 87. Chimæra Truss Leg, by R. Baker, Messrs. Holland and Sons, Gillingham-street, Pimlico, S.W.
 88. Vase of Flowers and Conventional Bracket, by G. H. Bull, 16, Millman-mews, Millman-street, W.C. Price £23.
 88a. Panel of Flowers, exhibited by Messrs. Gillows and Co., carved by R. A. Brangan, 54, Foley-street, W.—(Price of £3.)

- 89 & 90. Design for Damask Table Linen, by Miss A. Kemp, 27, Hereford-square, Brompton, S.W. Price of No. 89, 15s.; No. 90, 10s.

91. Design for a Book Cover, by Miss Mary R. David, Price £1 10s.

- 92 & 93. Designs for Damask Table Linen, by the above. Price 10s. each.

- 94 & 95. Works in Oil, by Charles Maiben, 40, West Hill-street, Brighton.

(The above are not eligible for Prizes.)

WORKS EXECUTED AND FINISHED BY MACHINE.

Exhibited by Charles J. Hill, 6, Albany-street, Regent's-park, N.W. :—

- 96—98. Three Groups in Ivory. Price £15.
 99. "Head of H.M. the Queen," in Ivory. Price £5.
 100. "Greek Head" in Steel. Price £8.
 101. Ditto, in Malachite. Price £5.
 102. Case with Two Proofs from Engravings on Steel for Surface Printing, and two "Medusa's Heads." Engravings and dies in hand. Price £4 each.

(The above are highly commended, but are ineligible for these Prizes.)

The SECRETARY read a letter from Mr. Digby Wyatt, expressing his great regret that he was prevented by illness from attending the meeting that evening. A letter from three workmen was then read, stating that the piece of *repoussé* work in iron (No. 15), produced by Mr. Page, to whom the first prize had been awarded, was "not embossed from the flat, but struck in a cast die obtained from the plaster cast issued by the Society." The Secretary said he had thought it right to make inquiry into the matter, and had been informed by Mr. Page that this was not the case.

Mr. J. S. NICHOLS suggested that the work might have been struck in a die and finished off afterwards, but that could not be regarded as *repoussé* work, which meant embossing from the flat.

The CHAIRMAN suggested that Mr. Page, who was present, should give any explanation he thought proper.

Mr. PAGE begged to state that the parties by whom the exception had been taken were under a false impression in supposing that the work had been struck from a die; but he had no objection to explain to his fellow-workmen the plan on which he proceeded. The manner in which the metal was "got up" was this:—In the first instance he soldered the plate upon a piece of block tin. Having explained what he considered the advantages of this plan, Mr. Page said that, as to the work having been struck in an iron die, those who entertained that idea could have little conception of the cost of producing such a die; and it must be further considered that to strike iron into such a die would be an extremely difficult task.

Mr. CAMPIN remarked that the prize having been offered for *repoussé* work, he considered that if the work sent in had been struck in a die it was not *repoussé* work, ordinarily so called, and he thought the question should be definitely settled.

The CHAIRMAN said it seemed to him to be a question of fact. The most proper and convenient course under the circumstances would be that the judges should hear the objections on the one side, and Mr. Page's explanation on the other, and decide whether, under the conditions of the competition, he was entitled to the prize or not.

Mr. PAGE expressed his perfect concurrence with this suggestion.

The CHAIRMAN said although the cheques for the prizes would not be delivered to the successful competitors that evening, he was sure those present would be gratified by having an opportunity of personally recognising such of them as were present; he would therefore invite those prizemen who were present to come forward.

This request having been complied with,

The CHAIRMAN said it was gratifying to find that the appeal made by the Society had received so satisfactory a response; because undoubtedly the competitors had shown that English workmen of the present day were not inferior to those of other countries, or inferior, at least in many respects, to the workmen of our own country in past times. It appeared to him that the competitors generally, and especially those who had been successful in obtaining prizes, had creditably maintained the high character of their own class by the works they had produced—works which, although in most cases they were merely reproductions of splendid examples of the taste and skill of former times, were, he might venture to say, scarcely inferior to them in excellence. It was certainly most gratifying to the Society of Arts, which had now for several years endeavoured to stimulate the art-workmen of England, to find that they had among them men whose taste, knowledge of colour and of form, and skill in execution, had enabled them to produce works which had called forth the approbation of such distinguished artists as the judges in this competition. He trusted that those who now, it might be for the first time, had thus distinguished themselves, would have frequent opportunities, on future occasions, of showing their fellow-countrymen that they were resolved,

as far as in them lay, that England should not be behind the rest of the world in works of industrial art. He begged to offer them his cordial congratulations, and he hoped to see them again in the same honourable position in future years. He trusted they would feel, at all events, that the Society warmly sympathised with them in the struggles they must necessarily make in endeavouring to maintain and improve the position they had acquired. He would now invite the art-workmen present to intimate to the meeting any views they might have formed as to the competition which the Society had instituted. The Council desired to know whether it seemed to them that any alteration in the arrangements would contribute more effectually to the objects in view in these competitions.

Mr. ASKE desired to make the following suggestions:—That in all cases the judges should have the original article placed before them at the time of awarding the prizes, as well as the copies sent in for competition; that the copy should be made in the same material as the original, or if the material is to differ from the original, that such change should be made in the following year or years—for instance, should the material be of iron, then the copy in the first year might be of iron, in the second of brass, &c.; that no specimens sent in shall be either painted, bronzed, or have any artificial coating, except transparent lacquer; that, where it is possible, the model selected be placed in the Society's rooms, or in some other accessible place; with regard to the photographs published for the use of competitors, that the background should be so arranged as not to in any way confuse the outline of the object.

Mr. HOLLIDAY suggested that in the case of bas-relief designs the works should be either on a larger or a smaller scale than the original, as this would ensure a proper process of modelling for the work exhibited.

Mr. NICHOLS remarked that the object would not be gained unless the condition was that the work should be on a larger scale than the design. With regard to the chasing in metal, he hoped care would be taken in future that the castings were sound, as this had not always been the case.

The CHAIRMAN said he would now call upon a member of the Council (Mr. Hawes), who was present on the last occasion, and was in a condition to compare this exhibition with the preceding ones, to address a few words to the meeting.

Mr. W. HAWES said the great object which the Society had in view in establishing this competition was to bring out the individuality of the English art-workman, and thus give him a greater incentive to improvement. In foreign countries a workman had opportunities of obtaining a personal reputation which enabled him to dispose of his services at a much more valuable rate than when his name and talents were only known within the limits of the shop where he worked, and his productions were only distinguished as those of the firm who employed him. The Society was therefore anxious, without wishing in any way to disturb the community of interest which ought to exist between masters and their workmen, if possible to stimulate the workman to strive after that excellence the attainment of which would be equally beneficial to himself and to his master. The difficulties were considerable in the first instance. They had first to find out the means of making the great body of workmen in the country acquainted with the intentions of the Society. They had then to overcome many prejudices; and besides this it happened that during the last three or four years almost every art-workman was so fully employed that but little time was left him to enter into such a competition. Indeed, on the last occasion the number of works sent in was less than in the previous year, and the number of prizes awarded was less. Considerable discussion took place as to the cause of this decrease, and the impression the Council received at the time was that the conditions required some relaxation. This was done, and

in the present instance they had not only given examples to be copied, but had allowed the men to send works produced from their own or other designs. The result was that they had on the present occasion a number of works made from designs other than those prescribed by the Council, and he thought it was in a great measure to that they owed the increase in the number of works sent in, which was nearly double that on the last occasion; the number of prizes awarded being also considerably greater. He could not but feel that a Society like this, established for the encouragement of arts and manufactures, was undertaking a duty which was specially incumbent upon it in endeavouring thus to benefit not only the working men themselves, but art-workmanship generally, in this country, and if they were doing that, there could be little doubt they were promoting the best interests of the country at large. The works before them certainly proved that the prizes offered had stimulated men to exertion in their spare time, and had resulted in the production of a number of very beautiful works, which had called forth the warm commendation of the two gentlemen who had acted as adjudicators—than whom none were more competent for the task. The Chairman, in addressing the prize holders, had stated his conviction that the workmen of this country would, if proper opportunities were afforded to them, ultimately produce works equal to those of any period of art history, if they had not already done so. He could not help hoping that in a few years this branch of the Society's operations would progress as much as its educational examinations had done, in which, from a beginning of about fifty candidates, they now had nearly 1,200. In like manner they might expect a similar increase in the number of competitors for their Art-workmanship prizes. He would say a word or two with reference to the objection which had been raised against the work sent in by Mr. Page. He had distinctly told them that his work was not struck in a die, and had explained to them how he had contrived to execute it. It had, however, been suggested by a preceding speaker that nothing ought to be admitted for competition but what was done in the old-fashioned way. *Repoussé* work, they knew, was produced in a particular way, and it was argued that no specimen ought to be entitled to a prize unless it was produced in the manner in which all *repoussé* work had hitherto been produced. He thought if they imposed a limitation of that kind they would be acting in direct opposition to everything they proposed to accomplish by these prizes. They not only wished to reward the workman who had the greatest mechanical and technical skill, but also to encourage the adaptation of any improved appliances which his ingenuity might suggest for producing the required results. They must all be struck with the fairness of Mr. Page's explanation, for, though some of the means employed might be new, the work was strictly *repoussé*, and a production of which he had every reason to be proud. It had been more than once suggested that these prizes ought not to be adjudged by one or two gentlemen selected by the Council, but that there should also be a jury composed of workmen and employers of labour. This, he thought, would certainly produce much delay, and would not work satisfactorily. They had had, on this occasion, two of the most highly educated men in this country—one much engaged personally amongst workmen, and well known as possessing special knowledge of such works; the other, Mr. Redgrave, a gentleman whose artistic taste was of world-wide renown, and he thought they had thus the greatest possible security that the prizes were properly awarded, and with the most perfect good faith to the Society and towards the workmen themselves. He trusted the exhibitors on future occasions would appear in still greater number, and that they would all feel that while the Society gave its gold and silver medals for discoveries in science and art, it was equally anxious to reward those whose labour,

though in a less exalted field, was equally meritorious, and equally worthy of recognition.

Mr. GEORGE GODWIN, F.R.S., as a member of the committee for the selection of the examples for reproduction was happy to be able to coincide in the opinions expressed as to the superiority of the collection of articles this year above those of previous years; still it must be remembered that not half the sum offered by the Society had been claimed; and it was to be hoped in future years there would be a more extensive response to the munificent offers made. With regard to the piece of *repoussé* work to which reference had been made, he would state that when the design was selected by the committee they were fully aware of the great difficulty of the task, and if that were a genuine piece of *repoussé* work he accorded the greatest praise to it. At the same time he claimed that it should be found to be true *repoussé*, for he could not go with Mr. Hawes in saying that the mode of production was comparatively unimportant. For instance, by means of the electrotype a *fac-simile* might be produced without that manual skill which was required in the production of *repoussé* work. He quite accepted Mr. Page's assertion that it was a genuine work, but he felt obliged to make this observation in reference to the remarks of Mr. Hawes. Touching the bronzes on the table, there was one figure exhibited of especial interest—that of Caractacus, produced for the Art-Union of London—because it reminded him that 25 years ago, when the Art-Union decided on producing a number of bronzes, and when Mr. Woodington made a reduced copy of Sir R. Westmacott's "Nymph and Child," there was scarcely a furnace in London in which such bronzes could be made, and so great was the difficulty of making the castings that the artist himself erected works to produce them. They went on year after year, and the late Prince Consort was so struck with the efforts that were then being made in this direction, that he paid for the cast of the production, in order that he might possess a copy of this work, the first specimen of the revived art of making bronzes in England. He might point to the bronze before him as being equal to anything that had ever been done; it was a work well entitled to the praise that had been bestowed upon it. The hammered iron work of Mr. Letheren was also exceedingly good. Touching the glass exhibited by Dr. Salviati, all would be glad to see the ancient mode of making glass in Venice revived. At the same time he would enter a protest against regarding every form, because it was copied from old Venetian glass, as beautiful. He confessed he thought the specimen before them was essentially bad in form. No doubt it presented great difficulties in the manufacture; but he thought Dr. Salviati could have exhibited many others of greater beauty. In reviving the art of making Venetian glass, it was important that the models should be well chosen. In conclusion he would express a hope that the art of drawing would form a part of every artisan's education to a greater extent than had been the case hitherto. He would like to see it form a part of the education of every artisan's child, from the conviction he entertained that the greatest advantages would result to them from it in afterlife.

The CHAIRMAN, in concluding the proceedings, expressed his belief that they had not been uninteresting or unprofitable to those who had engaged in them. With regard to the remarks of his friend Mr. Godwin, he might say that the specimen of Venetian glass before them was produced in accordance with the model selected by the committee, of which Mr. Godwin was a member, though he was probably not present when that selection was made. His object, however, in rising was to announce what he was sure it would be agreeable to the meeting to hear, viz., that another of the great City companies, namely, the Goldsmiths', had promised its co-operation in the efforts of the Society to encourage art-workmen, and had given a donation of £25, a portion of which was to be applied as prizes for workers in

the precious metals, and the rest in furtherance of the educational examinations. Many of these great guilds owed their distinction, in former times, to the extent to which they contributed to the extension and perfection of various manufactures; and he thought in no other mode could they better contribute towards the same object than by co-operating with the Society of Arts in stimulating and encouraging industrial art. He was happy to find that several of them had already done so. On previous occasions it had been announced that the Salters' and Clothworkers' Companies had agreed to contribute towards this object, and he was glad to find their example had been followed by the distinguished Company to which he had just alluded. He would express his gratification at the proceedings of this meeting, and at having had an opportunity of taking part on an occasion which seemed to him to herald a promise of great future advantage to the industrial arts of this country.

Proceedings of Institutions.

YORKSHIRE UNION OF MECHANICS' INSTITUTES.—Some years since the committee instituted an Itinerant Village Library for circulation among the inhabitants of the villages and small towns of the country. The plans adopted have been most successful, and many permanent libraries have resulted from the approved value of the itinerant collection. In the course of time the original library has been worn out, and the committee have resolved upon a thorough re-organisation. Sir Thomas Biddulph has informed Mr. Henry H. Sales that it is the intention of her Majesty to renew the gift of 250 volumes made in 1854, by his Royal Highness the Prince Consort. Mr. Titus Salt has generously offered a donation of £20. Other gentlemen have made liberal donations in books and money; and the trustees of Rebecca Hussey's charity have given a grant of books to the amount of £13. It is proposed to raise £250 in aid of the library.

SUPPLY OF FOOD FROM TEXAS.

By THOMAS AFFLECK, Esq., of WASHINGTON COUNTY, TEXAS.

Can Texas supply the food-wants of England? She can. Texas is a vast pastoral and wheat-producing country, within a few days' sail. She has innumerable flocks and herds, and valleys capable of being made to yield great and unfailing annual crops of rice. Texas is the most southern of the states of the late confederacy, lying far to the south, yet emphatically a white man's country, from the fact that by far the greater part of her surface is quite elevated, much of it consisting of high, rolling prairie, possessing a rich calcareous soil. Her timbered lands, except in the low alluvial river-bottoms, are elevated, open, and well-drained. As just remarked, the prairie soils are rich in lime; hence the grasses borne by them are sweet and nutritious; and hence again, the meats produced by these grasses are rich and nutritious, in this respect far excelling the meats produced by the coarse grasses of the great pampas, or parched plains of South America, or by the equally arid grazing lands of Australia, where even the coarse sedge-grasses, unnutritious at best, often and utterly fail, compelling the herds to browse upon anything that will support life.

Fat bullocks and sheep can be procured in Texas at all seasons of the year, and can be driven any distance without suffering to the animal or danger to the meat. Bullocks grow to a great size, carry much lean flesh, the fat being about the kidneys, loins, and brisket, not, as in England, intimately mixed with the lean, consequently they are not so good for roasts, steaks, &c., but better for preserving, and for yielding the *Extractum carnis*. The mutton of Texas is remarkably fine, unsurpassed by that of any other country. The supply of meat is great. Prices are at present low, but must advance somewhat with

an increased demand. The distance is that of a twenty or twenty-two days' voyage by steam, from Galveston direct, or about forty days by a good sailing vessel.

How, then, can England share in the abundance of Texas? The present ruined condition of the people of the south is well known. Texas suffered less than the others, inasmuch as that she possesses such vast herds of cattle, sheep, horses, and mules, is less inconvenienced by the destruction of her labour system, and was never invaded by the enemy; still her commercial resources are altogether insufficient to carry her immense and valuable productions to market. She has beef and mutton, game and poultry, oysters, fish and turtle, wool, hair and hides, in prodigious quantity, as also much cotton. She possesses well-nigh inexhaustible forests of lime, oak (*Quercus virens*), of cypress (*Taxodium distichum*), long-leaved or great southern pine (*Pinus palustris vel Australia*), together with many other valuable timbers. Of iron, copper, lead, gold, silver, and other minerals, and of coal, the store is great beyond computation. Nearly all of the rivers west of the Brazos afford water-power enough to work up all the raw materials produced. Her limits embrace some one hundred and seventy-five millions of acres! Much of this, perhaps, more than of any other equal surface of the globe, is of rich and productive land, well watered, and suited to the growth of all of those crops most valuable to man, by the labour of the white race, as cotton, sugar, rice, indigo, tobacco, hemp, madder, the oil-producing seeds, hops, wool, &c.

Rice can here be safely cultivated by the white man, because the lovely valleys of Western Texas, so easily susceptible of irrigation, will, with irrigation, produce it in abundance, and without any marked deleterious effect upon the health of the cultivator. Sugar is not only produced from the cane, but the beet thrives exceedingly in the prairie soils of Texas. She needs population as part of the return cargoes of the ships taking her products. Hence the desire for direct communication with Europe, now denied us by the hitherto indifference to, or overlooking of, her commerce on the part of European merchants. Let England import of our excess—of that first necessity, food, and especially meats—and send us of her surplus population.

In what shape and how shall these meats be exported? The climate, although a warm one during the greater part of the year—ranging from 60° to 90° from March until December, exclusive—is clear and dry, fine cooling breezes prevailing, and the nights always cool, so that meats can be handled almost the year round. Dr. Morgan's infiltration process can be successfully employed for salting, and will be; but the consumption of salted meats is limited, and the market easily glutted. When, however, the Morgan process comes to be used upon the healthy, sound, nutritious beef of Texas, and other antiseptics used with the salt, and when the causes which produce scurvy are more generally understood, salt beef will be more extensively used.

Meats have long been successfully cured by being cooked and hermetically soldered up in tin cans, as are also various rich soups, oysters, fish, &c. Although these articles, and others thus preserved, are extensively used on shipboard and abroad, the high prices at which they are retailed has prevented their coming into everyday use. But, suppose they could be offered at a less price than that of butchers' meat—already cooked, always at hand, and especially the rich soups thus preserved, and in many varieties—would they not be brought into common use? The wife of the labouring man is only too often but an indifferent cook—here is the article almost ready for her family, and in a palatable form. The wives of those classes who are better off would find a few dozen cans of preserved meats, soups, fish, oysters, &c., extremely convenient, from which to supply that variety to their families which is always desirable, and to meet those frequent emergencies with which the housewife has to contend.

The process of Messrs. Sloper and McCall has been pronounced an entire success. It is as yet held to be a secret, and may, or may not, prove an ultimate commercial success. There are other similar processes which are well understood, but it is greatly to be doubted if any of them will prove the successful medium through which England's wants, in the way of fresh meats, will be supplied from distant countries.

Professor Redwood's patented method of cooking boneless pieces of meat in that pure, tasteless, and colourless substance, paraffine, is not only a good plan, but one based upon correct principles. Whilst the mere water is evaporated from the meat, the whole of its juices are retained, and the coating of paraffine excludes the air. It needs a thorough trial upon a large scale, and commercially.

The writer, with some friends, partook of a broiled beefsteak, the other day, taken from a can in which it had been placed, uncooked, in October, 1865, having been first soaked a short time in a solution known as the "British Meat Preserver," offered by a company under that title in Upper Thames-street. The steak was excellent, a little dryish, though still juicy. The only objection that could be found to it was a slight after-taste upon the tongue, which, however, an onion-dressing would have disguised.

There seems one plan by which meats imported to England, by any or all the processes of preserving in tin, those of Messrs. Sloper and McCall, Professor Redwood, or the Meat Preserver Company, may readily be brought into common use, and prove the boon to the people which wholesome, well-cooked food must ever prove; and this is by the establishment of numerous cheap eating-houses in the cities and towns of this populous island, at the various collieries, potteries, cotton and other factories, foundries, rolling mills, &c., wherever large bodies of hard-working men are employed. This has been done in Glasgow by a philanthropic gentleman there, Mr. Corbet, and with the most perfect success. There a tired and hungry man satisfies that hunger fully and comfortably upon wholesome, well-cooked food, for fourpence.

Reform seems to be the exciting topic here at present. Here is the first and safest measure of reform—feed the people. Joint-stock companies seem to have fallen into great disrepute here; nor is it greatly to be wondered at that they should, as they have been originated and conducted. But here is an object—a purpose—for which such companies might be safely formed; requiring no great amount of capital, yielding immediate and sure returns, and open, in their management, to every one who chooses to study their workings. Such companies could not only feed the labourer at home, but, by the employment of shipping in importing meats from abroad, afford transportation to other countries to a portion of the plethora of population here.

The masters and owners of large factories, rolling mills, &c., would have fewer strikes to complain of, if they showed a greater interest in the physical comfort of their employes, by aiding and encouraging the establishment of cheap eating-houses, co-operative stores, &c. The economy to the labouring man, and the effect upon the comfort and health of his family, would have a wonderful influence upon him in every way.

There is yet another plan by which meat, in the form of fresh joints, &c., fresh from the shambles, may be brought from Texas to England. As applied to ripe fruits, it has proven a complete success in America. It is, to form the hold of a sailing-ship into a series of comparatively air-tight and moisture-proof rooms, in which the temperature is kept at a low point by a layer of ice overhead; some cheap and powerful absorbent of moisture being spread on the floor, to take up that which the meats suspended in the room may throw off. Similar means may be employed to act upon the air in the rooms. Within these rooms, the best joints of meat, suspended in close contact, firmly attached to fixtures, and with

rush mats, perhaps, between the courses, to prevent chafing, could be carried from Texas to England in as fresh a state, it is believed, as if newly killed; only, perhaps, a little less juicy; and hence they would be less liable to damage from re-exposure to the air than if not thus dried. By opening room after room, as required for sale, there would be neither loss nor waste.

And here permit a digression. It is understood that a very perfect building for meat markets is now being erected in London. Would it not be wise to arrange overhead such refrigerators as those suggested, in which the surplus meat of each day might be preserved fresh and sweet until sold? As matters are now conducted in the meat markets, much of that costly food is carried off each day somewhere for consumption or use, in a very unfit condition to serve as wholesome food.

In all such arrangements it must be borne in mind—and experience in America has proved the fact—that air which has passed over or in contact with ice, although it thereby loses its moisture, imbibes gases which are exceedingly injurious to animal food with which it then comes in contact.

But, to return—Dr. Hassall's flour of meat is another form in which importations may be usefully and profitably made. Even at the present high prices of the fresh article, the flour of meat is prepared and sold, no doubt, with profit.

Good fat meats cost in Texas, beef, say 1½d., and mutton 2d. per lb. Reckoning all the expenses of killing, curing, transportation, risk, and occasional loss, cost of selling, &c., these meats could be supplied to the consumer at prices greatly below what he now pays.

There is already a large consumption of the *Extractum carnis Liebig*. If it could be sold at a price to allow of its economical use in the kitchen, there is scarcely a limit to the demand which would arise; and this could be done if it were made from the rich and nutritious flesh of the beeves fed on the *mesquit* grasses of Central and Western Texas.

There are difficulties in the way of any extensive importation of flesh-food from Texas. To be done profitably it must be on a somewhat extensive scale, even to begin with. Few individuals likely to go into a business of this kind have the means at command to engage in it on a sufficient scale. There are breeders of cattle in Texas who would gladly engage in it if their cattle could be made to serve as the basis. Money is with them a scarce commodity.

The owners of the money and the meat must combine. Joint-stock companies are, at this time, as I have before observed, rather unpopular in England; yet it might surely be possible to form a combination of a few business men here, with cattle-owners and others in Texas, to do this thing of so much importance to the people of this island, and to do it prudently and profitably.

RUSSIA AT THE PARIS EXHIBITION OF 1867.

The Russian section occupies about 1,000 metres, in the rectangle part of the park, situated between the Palace and the Avenue de Suffren. There will be seen there:—

1st. A large shed, 30 metres long by five wide, in the Russian style; on the ground-floor will be exhibited agricultural machines; on the first-floor will be found an inquiry office, lodgings for six moujiks, and a store-house for forage.

2nd. Opposite the office of the Russian Commissioners, a pavilion in wood, very much ornamented, in the style of the boyars of Northern Russia. The entire mechanism of construction is visible. The purlins of the roof rest upon the principal rafters of the gable, and are held above by pegs of wood. The stove, with its cooking place, is, as usual, of terra-cotta.

3rd. A large isbah, or peasants' dwelling, composed of three buildings, grouped together; it is built of red pine, forming a complete dwelling; the walls are com-

posed of round barked trees, trimmed with the hatchet. The underpart of each piece of wood is grooved, so as to receive the upper part of the lower piece. The joint is packed with oakum. The ground-floor is appropriated for stabling. The first-floor, divided into two chambers, comprises the dwelling for the peasant and his children. In one corner is placed an immense stove of terra-cotta, which serves both as an oven for bread and for heating purposes. The staircase is outside. Joined to this building is a covered court, serving specially as a place of shelter for the farm carriages. There is also a small habitation (without stables) of white pine, arranged as in the large dwelling: it is a sort of lodge, with portico in front. Neither nail nor peg is used in these different constructions. The isbah altogether represents the arrangements on a large estate in Russia. They are put up by M. Gromoff, one of the largest timber merchants in St. Petersburg.

4th. A vast building, of 76 metres by seven, intended for stables, in which will be seen twenty-four horses, of which ten are the types of different races of Russian horses, and fourteen are to be carriage or riding horses. The first-named horses are placed sideways, in longitudinal boxes. They can thus be readily untied from the wall, and can easily be thoroughly examined. At the two extremities will be lodgings for ten moujiks. This building is highly ornamented. The style is an application of the art of the Central Russian hospodars, as used at the present day. Carved wood is much used in the decoration.

5th. A yurt, or tent, of six metres in diameter. It is made of felt, in the form of a hive. Above, an open space leaves passage for the light and the external air, and for the smoke from below. It is the national dwelling of the Cossacks and wandering Tartars.

In the space devoted to Russia will also be found a sign-post and a milestone, indicating the distance from St. Petersburg to Paris.

RATISBON CATHEDRAL.

It appears by the description referred to in M. Schnurbarth's letter (p. 157) that, the first cathedral of Ratisbon having been destroyed by fire in 1273, the foundations of the present structure were laid in 1275, and the building was continued, with frequent interruptions, up to the year 1496. Some portions, however, still remained unfinished; the present altar was not erected till 1785, and from 1834 to 1839 King Ludovic I. of Bavaria effected much towards the improvement and restoration of the building.

In 1858 an association was formed at Ratisbon, under the patronage of the King and the Bishop, for restoring and completing the cathedral, especially the two principal towers, surmounted by spires, which are to be raised from 152 to 366 feet in height. The work was begun in 1859, but up to 1863 the funds at the disposal of the association were but small. In that year the King undertook to promote the undertaking by an annual grant of about £1,700 sterling, and from that time the works have proceeded much more rapidly, though the funds appear to be still insufficient. Since 1860 about £2,600 has been spent on the building, which, it is anticipated, will be completed in 1870. The progress of the works is illustrated by the photographs kindly forwarded by M. Schnurbarth.

Fine Arts.

NELSON COLUMN.—The lions some years ago entrusted to Sir Edwin Landseer have at length been completed, and are now in their place at the base of the column. The cost will be indicated by the following entry in the estimates for the Civil Services. Nelson Column, Trafalgar-square:—An estimate of the sum that will be required to defray the charges which will come in the course of payment in the year ending 31st March, 1867,

towards completing the stylobate, &c., of the Nelson Column: For four colossal couchant lions, to be executed and placed on the radial pedestals prepared to receive the same: total estimate for the service, £17,183 10s. 1d. Vote required for the year 1866-7, £6,000.

PHOTOGRAPHS OF PICTURES IN THE NATIONAL GALLERY.—The arrangements for this work, noticed last week, are approaching completeness. It will consist of three volumes, folio, after the style and size of the Turner Gallery. The issue will, in the first place, be in monthly parts, at a guinea each. The entire work will contain 360 photographs, representing 180 masters. The task is committed to the care of Mr. R. N. Wornum, the keeper of the gallery. The same author's Descriptive Catalogue, "Epochs of Painting," and "Life of Holbein," indicate the materials at command. It is understood that Mr. Wornum will adopt a historical classification; a treatment which will combine the characteristics and chronology of schools, with the incidents of individual biography. Messrs. Virtue are the publishers. The photographs have been taken, as already announced, by Messrs. Caldesi.

KENSINGTON MUSEUM.—An ingenious contrivance has been adopted for the exhibition of numerous drawings within a small area. The apparatus has the appearance of a wheel with radiating and moveable spokes hung round an axle. These spokes or wheels, which are in fact picture frames, contain the drawings or other works designed for display. The plan may with advantage be adopted in provincial museums and schools of art, especially where wall space is scanty. It is at once to be brought into requisition in the Paris Exhibition. One of these pictorial machines will demonstrate to the French some thirty stages of study in British schools of art; another will display various reproductions, such as photographs, electrotypes, and fictile ivories, made and disseminated by the Department of Science and Art.

NATIONAL GALLERY.—Among recent additions is a picture, "Christ and the Disciples going to Emmaus," by the rare Milanese master, Altobello Mellone. This painter, though almost forgotten, is praised by Vasari, and the picture now added to our National Gallery is expressly mentioned by Baldinucci. Altobello Mellone, who flourished at the beginning of the sixteenth century, was of the schools of Cremona and Milan. In the cathedral of Cremona he executed frescoes from the life of Christ, which Vasari says were "exceedingly beautiful, and truly worthy of commendation." This picture of the journey to Emmaus was formerly an altar-piece in the church of S. Bartolommeo de' Carmelitani at Cremona. It was purchased from the Conte Carlo Castellarco, Milan, by the late director, Sir Charles Eastlake, as far back as November, 1864. It remained some time in Milan for the purpose of reparation. It is said, however, to have been in fairly good condition. It is painted in oil, on panel; it measures 4 feet 10 inches by 5 feet 5 inches; it is not signed; the figures are life-size; the price was £320. The work is of special value in our National Gallery as a link in a historic series. It is a fair example of Lombard painting; it serves to show that at the time art in Tuscany and Rome was at its height, the chief cities of Northern Italy also became centres of separate schools, and were prolific in pictures by masters once famed though now forgotten.

Manufactures.

BIRMINGHAM MANUFACTURES.—Exhibitions of industry are now recognised as institutions of all countries; as such they are supported, and it may be questioned whether any locality has been benefited thereby to the same extent as Birmingham. The display of the works produced there, publicly exhibited on the stalls of exhibitions, showed to the world that these were not "lacquered shams;" and the result of each exhibition has been to demonstrate that

Birmingham industry is progressive, capable of improvement, and improving; that while producing the useful, she is equally successful in the production of the ornamental. The means by which her position has been vindicated, her progress rendered strikingly apparent, and the demand for the productions of her manufactures in brass increased, is owing to the publicity and to the instructive lessons afforded by Industrial Exhibitions.

Commerce.

FISHERY EXHIBITION AT THE HAGUE.—An Exhibition of Fishing Implements and Produce is to be held at the Hague, in the present year, by the Society for the Encouragement of Industry there. The importance of the Exhibition held in Amsterdam in 1861, and the beneficial results obtained by it, being now fully acknowledged, and Norway and France having followed the example thus set to them, the Society for the Encouragement of Industry, desirous of promoting the interests of this branch of commerce, and having observed with great interest the steps taken for the improvement of fishery during several years past, proposed to hold an exhibition of Fishing Implements and Produce at the Hague during the time of the nineteenth general meeting of the society, which will take place this year. The Hague, situated close to Scheveningen, an important fishing port and bathing-place on the North Sea-coast, has lately been greatly extended and embellished, and is moreover well known for its beautiful environs. Yet the most important reason for choosing it as the seat of an Exhibition of fishing implements and produce is, that the Hague is the principal town of the province of South Holland, which province is intersected by streams and currents, and contains the fishing-towns and ports of Scheveningen, Katwijk, Noordwijk, Pernis, Dordrecht, Middelharnis, Zwartewaal, Maasvluis, and the ancient town of Vlaardingen, whose history has always been connected with fishery. Besides these advantages, the Exhibition will be supported by the authorities, grants having been made by the Provincial States and the Municipality of the Hague, so that all things tend to insure the success of the undertaking. The Exhibition will include every object connected with sea and fresh-water fishery. The articles will be divided into twelve classes, in the following order:—1. All sorts of fishing-smacks, boats, &c., used for fishing purposes, and drawings thereof. 2. Every object used for rigging and fitting out these smacks and boats. 3. Fisherman's clothes. 4. Implements used for fishing, viz., nets, ropes, hooks, harpoons, &c., and the raw materials for making these nets and ropes. 5. Various sorts of tan, serviceable to preserve and maintain the nets. 6. Bait for fishing (natural and artificial). 7. Implements used for the preparation, to salt, smoke, and dry fish, as well as salt used for the purpose. 8. Fish unprepared, prepared, and packed. 9. Packing materials, and all other objects used for the exportation of fish. 10. Objects of general use in connection with fish and other sea-animals, such as train-oil, whalebone, and manure. 11. Models of basins, folds, hurdles, vases, boxes, &c., and the preparations used for the artificial culture of fish and crustaceous animals. 12. Books about fishery. At the close of the Exhibition, gold, silver, and bronze medals, as also honourable mention, will be awarded to such exhibitors as shall have distinguished themselves. Freight to and from the Exhibition, as also insurance of the articles exhibited, against fire and sea damage, will be paid by the Committee, on condition that the regulations made by them, and which can be had on application to the Secretary of the Committee, are strictly followed by the exhibitors. The exhibitors are requested to take the greatest care in packing, as, should damage or injury to the objects be caused by bad packing, the Committee will not be re-

sponsible. The objects to be exhibited must be in the hands of the Committee before the 15th of May. The exhibitors have the right to sell the articles exhibited, which, nevertheless, cannot be withdrawn before the close of the Exhibition. Any person wishing to exhibit, must give notice to the Secretary of the Exhibition, J. A. van Iterson, Esq., at the Ministry of Justice, the Hague, before the 15th March.

SUGAR MANUFACTURE IN RUSSIA.—Herr F. O. Licht, of Magdeburg, quoting from the *Neue Presse*, gives the following statistical statements about the beetroot sugar production in Russia for the season 1864-5:—"At the beginning of the season 1864-5 there were 336 sugar factories in Russia, 63 of which remained inactive during that season, leaving only 273 out of the 336 manufactories at work. The quantity of sugar produced amounted to 3,326,141 poods, or 53,455 tons (English measure) of raw sugar, that is to say, 6,864 tons more than in the previous season. The duty levied on the raw produce amounted to 615,303 roubles 70 copecks (nearly £93,000 English money), while the amount for the certificates of the manufactories amounted to £5,200. The number of labourers was 40,304 men, 16,723 women, and 4,645 children. According to the following statement, the production in Russia, for several years past, was:—

Years.	Manufactories.	Tons of Roots.	Tons of Raw Sugar.
1859-60 ..	424	833,988	26,519 ..
1860-61 ..	398	708,233	21,246 ..
1861-62 ..	353	573,418	17,202 ..
1862-63 ..	299	542,073	11,990 ..
1863-64 no returns	46,591 ..
1864-65 ..	273	1,011,762	53,455 ..

SUGAR IN FRANCE.—From the circular of M. Boulanger, and from the official returns of the *Moniteur*, we (*Produce Markets' Review*) extract the following statement as to the movements of sugar in France during the seasons 1865-6:—

	1866.	1865.
Factories at work.....	439	419
	Tons.	Tons.
Production so far of the season..	155,383	182,546 ..
Average monthly production ..	53,398	57,090 ..
Average monthly consumption ..	15,401	22,663 ..
Average monthly export	2,773	11,461 ..
Stock in the factories	65,278	52,419 ..
Stock in the Lille entrepôts	3,734	4,286 ..
Stock in other entrepôts.....	36,920	29,509 ..
Total stock	105,932	86,214 ..

From the above it will be seen that, notwithstanding a decrease in the production of 27,000 tons, the stocks show an increase of 19,000 tons. This circumstance is explained by a reference to the exports, which give only 6,000 tons in 1866, against 33,000 tons in the same period of 1865. The sugar production during the last two seasons was thus distributed:—

	1864-5.	1865-6.
First four months ..	121,913 tons.	182,546 tons.
Last eight months ..	27,101 "	91,467 " ..

Total 149,014 ,, 274,013 ,,

Assuming the last eight months of the present season to be in the same proportion to the four previous months as in the season 1864-5, the remainder of the production would amount to 35,000 tons, and bring up the total to 190,000 tons. If we take the proportion which existed between the first four and last eight months of the season 1865-6, the remaining production would be as much as 78,000 tons, and the total production would be 233,000 tons. In all probability the production will be between these two extremes, and will reach about 210,000 tons. The manufacture was carried on in December with almost as great activity as in November; in fact, there were four factories which only commenced work in December.

Colonies.

PRICES OF FOOD IN VICTORIA.—The promise of abundance fills the farmers of this colony with fear lest prices should fall below the remunerative point. It is alleged that in Adelaide wheat of the new crop is being purchased at 3s. 6d. per bushel, delivered in January, and the farmers are alarmed at the prospect of the same prices ruling in Victoria. A conference has been held at Melbourne of delegates from several agricultural districts, to devise means to have a corn tax imposed, when, after much discussion of the comparative merits of a fixed and a sliding scale duty, they decided in favour of the latter, and resolved to take active measures to induce the Legislature to impose such a duty. It is generally understood that the farmers will not be content with any arrangement that permits the price of wheat to slide much below 7s. a bushel, or something like double what its true value is likely to be in future. Some want the Legislature to fix the price at 7s., some at 6s., and some are so moderate as to say they would be content with 5s.; but there is no likelihood that the colonial parliament will do anything whatever in the matter.

Obituary.

JEAN AUGUSTE DOMINIQUE INGRES.—The patriarch of French painters died at his house on the Quai Voltaire, Paris, on the 15th January, in the 87th year of his age. He was born at Montauban, on the 30th of August, 1780. His father was a sculptor in plaster, and young Ingres came to Paris in his seventeenth year, and in 1800 he won the second prize in painting, and two years later he won the grand prize, which made him nominally a pensioner of the French school in Rome, but the finances of the country were then in so low a condition that there were no funds for such purposes, and he remained in Paris, earning a scanty livelihood by his pencil. In 1806 he obtained the means of going to Italy, and from that time he was more Italian than French; in fact it is said that, with the exception of ten years, he lived constantly in Italy until he was about sixty years of age. His absence did not, however, prevent his contributing to the exhibitions of Paris; and the list of his works, though not long, is considerable. Amongst them the best known or most remarkable are, "Achilles Receiving the Messengers of Agamemnon," which won him the great prize, now in the school of the Beaux Arts, in Paris; Portraits of Napoleon as First Consul and Emperor; "Raphael and the Fornarina;" and many others, especially "the Apotheosis of Napoleon I.," a ceiling in the Hôtel de Ville of Paris; "La Source," shown at the International Exhibition in London in 1862; and many fine portraits. In 1834 the dispute ran so high between the admirers of Ingres and of his rivals, and especially those of Ary Scheffer and Delacroix, that he ceased from that time to send his works to the Paris Salon. At the Paris Exhibition of 1855, two special rooms were set apart for the works of Ingres and his great rival Delacroix, and each received a grand medal of honour. Ingres had received nearly all the honours which are bestowed upon artists; he was decorated in 1824, and in 1854 was made Grand Officer of the Legion of Honour, and in 1862 he was made a Senator. He had been a member of the Institute of France for thirty years. Ingres devoted himself wholly to the study and imitation of the Italian school. His drawing of the human figure was faultless, and his designs will take rank with those of the great Italians whose works inspired all his efforts. Originally, Ingres's father destined him for a musician, and he became an excellent violin player. His funeral was attended by a vast concourse, the Emperor being represented by Comte de Nieuwerkerke, chamberlain. After the funeral the Emperor sent an autograph letter of condolence to

Madame Ingres. Some of the most famous paintings of Ingres will be shown at the forthcoming Universal Exhibition, and their interest will be greatly enhanced by the death of the artist.

PUBLICATIONS ISSUED.

THE GEOGRAPHICAL DISTRIBUTION OF MAMMALS. By Andrew Murray, F.L.S. (*Day and Co., limited.*)—This work is of a high educational character. It consists of three parts, each of which in itself contains materials for a separate work. The first part, or introduction, treats of the principles through the action of which the present distribution of plants and animals has been produced; and, of course, among a multitude of other speculations, the origin of species occupies a prominent place. Mr. Murray's view upon it are decidedly the most important part of the book; and, if Darwinism be true, will help to remove a great stumbling-block from the way of its acceptance. The reader knows that a chief, probably the chief, practical objection to Mr. Darwin's theory of the change of species by a gradual long-continued principle of variation being constantly in operation in all animals, is that no evidence of transitional forms has ever been found in past geological epochs, nor observed at the present time, but the contrary; whereas if the theory were true, a gradual transition should be observed by geologists in the fossil remains, from the oldest formation down to the newest, and in living species there should be universal confusion—nothing but a multitude of individuals in different stages of change and progression to something else. In fact, as put by Darwin, species would be impossible. As Mr. Murray says, "he has no brake by which to arrest the progress of variation when a species was completed." According to Mr. Murray's hypothesis, change in the animal only takes place when it is subjected to change of condition, the subtle effects of which, on a small scale, we all acknowledge by our periodical migrations to the sea side or country quarters for change of air. It is scarcely fair to state the hypothesis without also mentioning the concurrent views by which the author reconciles the difficulties, and anticipates the objections to his theory. These, however, would occupy too much space. It will be sufficient to say that the above is the key offered for the solution of the problem. According to it the normal state of organic beings is stability, not variation, as supposed by Darwin. So long as conditions are unaltered, or so slowly altered as to make the change imperceptible, species will remain the same; time, therefore, does not enter into the question except as multiplying the opportunities of change. But, whenever a change in condition does take place, a modification of species follows. Mr. Murray draws strong support from the facts of geology, showing how, when the temperature of the earth was greater, and consequently, less variation in condition existed, the changes in form were few, and that, as the temperature decreased and conditions multiplied, so did species; and how, when the most important change of all—the glacial epoch, when for the first time the earth knew frost and snow—appeared, most changes of all took place, and, to all appearance, man among them. The second part of the work is devoted to the actual distribution of mammals—upwards of a hundred chromolith maps being given, showing the extent of the distribution of different families and genera; the past changes of sea and land; the former union or separation of continents as deduced from them and from the affinities of the mammals now found on them; and the past distribution, as gathered from the fossil remains of extinct allied forms—all are treated of at length. Paleontology forms a large portion of the subject of the volume; and although there are some parts, relating to the affinities and classification of species, which are rather dry reading to one who is not a naturalist or

with interesting speculations and attempts to solve puzzling questions relating to the past condition of our globe. From the data he has brought together, the author divides the world into four great regions, each sub-divided into one or two lesser provinces. The third part, or appendices, obviously contain the results of a great amount of study, but of course their value is that of a work of reference. The publication of a separate reprint of the first part and other general matter would be desirable, leaving the more technical information and details to be obtained by the naturalist and man of science from the more expensive quarto now published.

THE TEXTILE MANUFACTURES AND THE COSTUMES OF THE PEOPLE OF INDIA.* By J. Forbes Watson, M.A., M.D., Reporter on the Products of India to the Secretary of State for India in Council. (*Printed for the India Office.*)—This work, a copy of which has been presented to the library of the Society of Arts by the Secretary of State for India in Council, constitutes the key to twenty collections of Indian textile fabrics, each comprising seven hundred working specimens, which have been distributed in this country and in India for the purpose of illustrating this branch of commerce, and facilitating and promoting trade operations between the two countries. Of these extensive collections, each of which is contained in eighteen large folio volumes, seven have been sent to India, while a single copy has been deposited at each of the following places in Great Britain:—Belfast, Bradford, Dublin, Edinburgh, Glasgow, Halifax, Huddersfield, Liverpool, London (India Office), Macclesfield, Manchester, Preston, and Salford. It is intended, as stated by the author, that each of these sets should be rendered "easy of access to agents, merchants, and manufacturers," and indeed to anyone bearing an order from (amongst others) the Secretary of the Society of Arts. The smaller work affords a detailed explanation of the objects that the author had in view in forming the collections referred to. "The interests of India require," he says, "that nothing should be done to prevent her from receiving the benefits which may arise from competition between different sources of supply, or to interfere with the extension to other countries of the knowledge of the manufactures and products she is prepared to sell. It is admitted to be for the mutual advantage of India and of this kingdom that the most intimate commercial relations should exist between them. Nothing will conduce to this more certainly than a full and correct knowledge of what India can produce and what her people want. The means of acquiring this knowledge these volumes furnish, so far at least as textile manufactures are concerned. The twenty sets may be regarded as twenty industrial or trade museums, placed here and there in the two countries, and it is but a reasonable expectation that they will be extensively studied and consulted by the manufacturers of both. The result of this will assuredly be an increased interchange of commodities. The British manufacturer will learn what goods are likely to prove saleable in India, and what he can produce more cheaply than the native can; while the British merchant may find among some of the delicate fabrics of India, or of those which are elaborately decorated, articles which it will be profitable to import, because they can be made more cheaply in the East. In addition to this, in consequence of each set being as much as possible an exact counterpart of all the others, these museums will facilitate trade operations in the way already described, and will enable merchants to give, and manufacturers to execute, orders more readily and more accurately than they otherwise could." This work, and the collections it explains, will certainly teach many valuable lessons

to manufacturers in this country, so as to enable them to adapt their productions to Eastern tastes and wants. It is important that they should know that a large proportion of the clothing of the people of India consists of articles which are untouched by needle or scissors, and which, in fact, leave the loom in a state ready to be worn, such as shawls and scarfs. The importance of only using fast colours is strongly urged, as the clothing of the Hindoo is frequently washed, and a failure of the colour naturally destroys the value of the fabric. Other points are, that the clothing of the people of India "is chiefly made of cotton; that there are certain colours, or tones of colour, which are favourites; that gold is largely used in the ornamentation of all sorts of fabrics; and that in the decoration of every garment regard is always had to the special purpose which that garment is intended to fulfil." It appears hardly to be expected that the British manufacturer will ever be able to supply the higher classes of the natives, as he is scarcely likely to be in a position to compete with the native manufacturer in the more beautiful and expensive classes of fabrics, but he may hope for a large and lucrative trade with the lower classes. This work, and the collections it describes, seem likely to be of the greatest value in promoting our trade with India; and any member of the Society of Arts desiring to inspect any of the collections (one of which, it will be observed, is deposited at the India office) can do so, as above-mentioned, on applying for an order to the Secretary of the Society.

Notes.

NEW COURTS OF JUSTICE.—The exhibition of the competitive designs, in New-square, Lincoln's-inn, opens this day (Friday). That and the following day are reserved for private view. The drawings will be open to inspection for a month. The exhibition of designs for the new National Gallery closed on Saturday last.

THE COLONIES AT THE PARIS EXHIBITION.—The colony of Tasmania, to which 600 feet of space was allotted at Paris, by the last advice declines to exhibit, although it made a very admirable display at the International Exhibition just held at Melbourne. The Cape mail lately arrived announces that the House of Assembly there had voted £1,000 to defray the expense of that colony at the Paris Exhibition. Thirty feet has been allotted by the British Executive for a display illustrating the arts, manufactures, and commerce of west and central Africa.

FRUIT AND VEGETABLES IN INDIA.—Lofty and spacious market-sheds, for the sale of meat, vegetables, and the various other articles *de consommation* to be found in an Indian bazaar, have recently been introduced into Bombay. These erections were to be opened about the middle of January, by the holding therein of a horticultural exhibition. Upwards of £300 has already been subscribed for prizes, and the committee have thus been able to offer both valuable and numerous prizes to the successful competitors. The whole list of fruit, flowers, and vegetables, in regard to which competition is invited, comprises a total of some sixty varieties. In the glowing climate of India, florists must always have the advantage over horticulturists. While the finest flowers which at home are precious hot-house treasures, will almost look after themselves in India—always supposing there is plenty of water at hand—the products of the kitchen garden require much painstaking, in order to produce them remuneratively, of proper flavour and in constant succession. With regard to exotic fruits and vegetables, especially those which are of vital importance to the European residents, the backwardness and neglect of anything like market gardening on the scale that is required for Bombay appear to be very considerable. The committee of this market-show have, there-

* An edition of this work, with coloured plates, has been published by the Messrs. Allen, Waterloo-place, price £3 5s.

fore, done wisely in apportioning 27 prizes for vegetables, while 17 suffice for fruit and 15 for flowers. Special prizes have been offered for vegetables grown in soldiers' gardens.

LIFE-BUOYS.—A new life-buoy has been invented by M. P. G. Pignonblanc, the efficiency of which has been tested by very competent persons. It appears to be as ingenious as it is simple, and has the great merit of always being handy and applicable in nearly all cases of shipwreck. The life-buoys at present in use only sustain the person on the surface of the water, but do not guarantee him either from cold, hunger, thirst, or from sharks, that are met with in great numbers in hot climates; and once abandoned on the sea the man is unable to have any repose. On board even the largest ships there are but few life-buoys, and in case of shipwreck but few persons can take advantage of them, and in a heavy sea those unfortunate persons are soon knocked about and drowned by the waves. The life-buoy of M. Pignonblanc is simply an ordinary cask, the bung-hole of which is enlarged in order to admit a man, and round this hole a sleeve of canvas is nailed about 18 or 20 inches in length, and may be secured with a short piece of spun yarn. This sleeve is only closed when the breakers are very heavy, in order to prevent the water from entering into the cask. In order to prevent the cask from rolling, a weight or piece of iron is attached by means of two pieces of cord. The inventor states that he got into the cask at about 200 yards distance from the shore, on which the waves broke violently. The cask drifted slowly towards the breakers, the first of which caught the cask, which inclined slightly but was instantly lifted up again. The second and third drifted it towards the land, where the fourth breaker safely deposited it. The piece of iron then served as an anchor, and instead of being washed back to sea the cask remained on dry land. In this cask provisions may be taken and be kept dry, and the person may rest himself as in a hammock.

RUSSIAN RAILWAYS.—During the month of October, 1866, the railway from St. Petersburg to Moscow conveyed 136,236 passengers, 55,667lbs. of luggage, 4,323,563lbs. of goods; and its receipts were 1,200,406 roubles, which is 136,281 roubles more than in the corresponding month last year. From the 1st of January to the 1st of November, 1866, this railway conveyed 1,170,723 passengers, 538,285lbs. of luggage, and 41,178,815lbs. of goods. Its receipts were, during that time, 10,339,774 roubles, which makes an increase of 1,375,088 roubles over the corresponding period of 1865.

ENCOURAGEMENT TO SCIENCE.—M. Frémy, member of the Academy of Sciences of France, has put forth a proposition, which is not unlikely to be adopted by the Government. He says that the career of science is that which offers the least security. A young man devoting himself to scientific pursuits has difficulties of all kinds to contend against; and many real *savants* reach their fiftieth year before they can obtain even the modest employment of *préparateur*, while many of the greatest discoverers leave their families in absolute poverty; there is, therefore, a natural hesitation to enter on a purely scientific career, and science loses the services of many intellects of the first order. Another evil is that young scientific men, unable or unwilling to wait, enter into manufacture without that complete knowledge which would render them so much more valuable in the scientific trades. Professorships are necessarily limited in number, and occupy a considerable portion of time, which might be devoted to original investigation; besides, says M. Frémy—and although a truism it is often overlooked—it is not every learned man who has the qualities necessary for a good teacher of his art. M. Frémy's proposition is that there should be established sixty places, or titular professorships, in three classes, with salaries of two, four, and six thousand francs per annum respectively, and that these appointments should only be given to those who have done real service in the

cause of science; and he proposes the adoption of the plan of the Ecole Polytechnique, in which establishment the professors, assistants, and examiners have to submit to re-election every third year, in order that the places shall not become equivalent to retiring pensions. The total cost of such an arrangement as that proposed by M. Frémy would be £9,600 a-year. It is beyond question that of all classes of educated men those who follow pure science have the most difficult and most thorny path to tread; and now that industry is calling for all the science it can obtain to improve its productions, the value of original research becomes daily, not more important, but more evidently so. The principle advocated by M. Frémy has already been applied in the case of the Museum of Natural History of the Jardin des Plantes, where a laboratory was established last year by the Minister of Public Instruction, on the proposition of M. Chevreul and M. Frémy, where more than fifty young scientific men are enabled to pursue their studies, and carry on original investigations under unusually favourable circumstances, and without cost to themselves. The scheme of the great public laboratories of Prussia has naturally drawn the attention of the *savants* of France to the policy, and even the necessity, of taking all possible precautions to prevent their own country being outstripped. The proposal applies to France alone, but the principle to all countries. M. Frémy would have the Government supply the funds, and give to the Academy of which he is a member the power of nomination; but such a plan would not have general support in France, and in other countries it would be still less acceptable. But the value of the pursuit of original scientific investigation, in a commercial sense, is now so generally understood that, if ten thousand a-year would materially aid its professors, there ought to be little difficulty about the matter.

Correspondence.

IRON PERMANENT WAY.—SIR,—As I was not able to assist at the discussion of Mr. Rochussen's paper on "Iron Permanent Way," will you allow me space in your journal to contribute some of my own experiences? Mr. Rochussen appears to have stated that the difference between my wrought iron permanent way and that he advocated was, that I suspended my deep rail from two angle irons with the horizontal webs above, whereas on his plan the horizontal webs were placed below. This is not a distinction without a difference, but it is at variance with fact, inasmuch as I used the same arrangement of rail and angle irons both ways on two separate lines with the horizontal flanges both up and down. The apparent advantage of the flange down is the greater accessibility of the bolts confining the angle irons to the rails. But this is more apparent than real, inasmuch as I never found the bolts or nuts—bedded in the ballast, the angle irons being fitted in the rail channels with an elastic curvature, compressible in screwing up—I never found them to move. They keyed firmly into the ballast by their projections. The packing, being on the surface, was easily accessible without opening out. As regarded the result of the two systems of placing the angle irons, the horizontal bearing of the angle irons above, at the ballast level, was immeasurably superior. It was perfectly steady, and kept out rain completely from below the iron, though in some localities the two rising rail heads formed a pond between them. In laying down, the practice was to bolt the rails and angle irons together, with the horizontal flanges downwards, in lengths of a quarter of a mile, and then to turn them over and connect them together, and put on the tie bars. It was remarkable in this process to observe their facility of torsion, like a long snake, notwithstanding their rigidity both vertically and horizontally when laid *in situ*. This facility of torsion is an important element in ensuring a close fit on the ballast. Another important

fact was gleaned while laying down. The form of the rail was double headed, each head 2 inches wide by $1\frac{1}{2}$ inch deep, connected by a vertical web $\frac{1}{2}$ inch thick by $3\frac{1}{2}$ inch deep, making the total depth of the rail 7 inches, while the spread of the angle irons was 13 inches, the top of the rail head rising only $2\frac{1}{2}$ inches above the bearing surface on the ballast. Thus there was a keel $4\frac{1}{2}$ inches in depth below the bearing surface, which prevented all lateral movement. It was remarked that there would be great difficulty in "slewing" such a rail; but the answer was that if once laid straight it would never want slewing, *i.e.*, side moving, a process only resorted to when the lateral action of the flanges of the engine wheels forces the line to one side, a common thing with smooth surfaced transverse sleepers. The fact ascertained while laying was, how very small a bearing surface was actually needed to sustain the rails on the ballast, when laterally and vertically stiff enough to distribute the load over long lengths. On the main line where it was laid down, there were very short intervals between the trains, and the process had to be performed rapidly; the cross sleepers and rails of the old line were removed, and the hollow sleeper pits remained open. On this about $\frac{1}{2}$ mile of the wrought iron was laid down like a long ladder, the bearing surface being only the rail edges, 2 inches in width, equal only to 52 square inches per yard run, or 835 feet super per mile. The sinking of the rails on the surface with the fast train running over them was only $\frac{1}{2}$ -inch, and this did not increase with a considerable number of subsequent trains. The ultimate bearing surface when ballasted up was 11,440 feet super per mile, or 936 inches per yard run. The bearing surface of an ordinary cross sleeper rail, spaced 3 feet apart, is 12,320 feet super per mile, or 1,000 feet per yard run, but as only two-thirds of this surface is practically available, it is reduced to about 8,200 feet, or 720 inches per yard run. The inference to be drawn from this was that 10 inches in width continuous under each rail gave as much bearing surface as the cross sleeper rail, and inasmuch as it was a continuous bearing surface, eight inches would be found ample. As this iron way was laid down at the instance of Robert Stephenson and Joseph Locke, in a report to the directors of the London and North Western, it may be supposed that considerable thought had been given to it, and some practical experience. What, then, was the result? It was taken up one morning suddenly, after being in use six months; the exact reason I could never ascertain, but only that it was by order of the directors. Many reasons might be imagined. In the first place it is a nuisance to have a mile or two of experimental permanent way forming a portion of a main line, and requiring particular men to attend to it. Again, what is everybody's business is nobody's. Then there are many vested interests whose owners will continue to cry, "Great is Diana of the Ephesians." Again, the officers of the company are placed in a very invidious position. They get no credit by working the plan of a stranger if successful, and it is easy to throw the blame on them if unsuccessful. And sometimes there is at work the Scottish process known as "blowing in the big mon's lug," for "Robert is no ane o' our clan, an nae kith or kin." All these considerations act as a drag-shoe on too rapid progress, sometimes usefully and sometimes mischievously. The facts, during six months' usage, were, that it proved a much smoother road than the cross-sleeper road, and, on the whole, less noisy, though the noise was of a different kind. It was a continuous whirr, induced by the constant slip of the carriage wheels, with a rigid, minute vibration, like the scrape of a fiddle bow newly rosined, and the sensation was precisely the same on the three kinds of ballast that were used—one a loose-blowing sand; another, gravel much mixed with dirty clay; a third, large hard flint nodules, taken out of chalk, the ground being a wet clay bottom badly drained. Carriages commonly have more or less end play on their axles, and any

irregularity in the rails is thus avoided. With engines little or no end play is allowed, and, consequently, with a rail literally stiff and unyielding any irregularity becomes sensible on a jar. Now these rails, 13 inches wide on the bearing surface, were perfectly rigid, and, at the same time, they were imperfectly manufactured, and there were many "kinks," or irregular curvatures. When these occur in ordinary cross-sleeper rails, the evil is corrected by sliding and packing the sleepers endwise, and this kind of keeping the line in order is a common operation of the platelayers. In the case of the iron way, they endeavoured to correct the evil in the same way, but however carefully they might do it, the first passing train restored it to its normal position. The reason was, the ordinary way, being simply plastic, had no will of its own. It simply took the position into which either the engine or the platelayer thrust it. The iron way, on the contrary, was really permanent. As it was made so it remained, and was probably the first sample of permanent way in which this condition was attained. Had it been rightly made, it would have remained in good condition till the rails were worn out. There was another consideration. The number of bolts rendered it difficult to replace a nail in the same short time as on the ordinary plan. But on the whole the advantages were obvious enough to have warranted a continuance of the system with better manufacture. As regards the wear of the rails, I do not think that it was inferior to that of ordinary way; but they were of soft iron, and of course were liable to crush. But certainly the crushing of rails is more likely to take place with unequal bearings than with those which are continuous. With regard to the so-called rigidity, I believe the notion arose chiefly from the sharp ringing sound; and if the wings or angle bearings had been laid on strips of board this would have disappeared. Still there is no doubt on my mind that a certain amount of elasticity is essential to permanence and easy running, not merely vertically, but laterally also, and this whether steel rails or iron be used. I have found in practice that longitudinal timbers, trenched down on cross sleepers, and with the chairs spaced intermediately, with the sleepers thus resting on unpacked spaces, is the best arrangement with timber. The elasticity is thus continuous, and there is absolutely no blow; and laminated iron rails are no more liable to crush than homogeneous steel ones. But squares of cast iron or of slate, 5 inches thick and measuring about 6 feet superficial, in clay land, level with the surface, would be by far the best arrangement, and would, with great advantage and with ultimate economy, dispense with the cross sleepers of timber, and most probably with ballast also. On these the elastic longitudinals could be fixed. Mr. Juland Danvers asked why timber sleepers, used so commonly in England and on the Continent of Europe, will not answer in India. The reasons may be thus stated. First, there, is the presence of the white ant, which seems to eat up every timber but teak, and that is too valuable, and it is cheaper to import creosoted fir sleepers from Europe. Secondly, heavy tropical rains saturate the timber, and then the hot sun shrinks and splits it. White ants do not like creosote; but again, a hot sun is not favourable to creosoted timber, unless it be wholly buried in the ground. For these reasons, engineers have taken to iron sleepers in the pot form, and these sleepers, Mr. Danvers states, are apt to crack. This could be remedied, of course, by heavier metal, but that involves much extra cost in material and freight, and more than that, in the handling. If iron way is to become the rule in India, it will gradually come to be wrought iron way, and past experience has not yet convinced me that wrought iron way must necessarily be more rigid than any other way, and especially cast iron way. I believe the question to be quite soluble whenever Mr. Danvers, in his capacity of multiple director of Indian railways, shall enter upon the synthesis with the same energy and acumen that he has given to the analysis, and satisfy the Indian Government

here that a very moderate expenditure will enable them to establish a permanent type at two-thirds the cost of the existing way. A curious phase has come round in timber sleepers in England. Time was that the sleepers decayed too fast by rotting, and so creosoting was introduced, adding 25 per cent. to the cost of the sleepers. Some companies still continue to creosote all their sleepers. Others have ceased to creosote the sleepers of the main line, because the destruction has become mechanical in too short a time for decomposition to act. With regard to the comparison made between steel and iron rails, the chief difference consists in the former being homogeneous, and the latter laminated in structure. I believe that iron rails made by the Bessemer process will prove ultimately to be more desirable than steel, for steel rails, unless perfectly annealed, or else hardened and tempered throughout, are not trustworthy. A steel rail, with hard and soft portions, is very liable to break; and I am by no means sure that a hard top and soft bottom will not ultimately resolve itself into stripping. The Bessemer process, giving us the power of producing iron in any required mass, and dispensing with puddling and welding, is an enormous national benefit.—I am, &c., W. BRIDGES ADAMS.

Journal of the Society of Arts.

FRIDAY, FEBRUARY 8, 1867.

Announcements by the Council.

ORDINARY MEETINGS.

Wednesday Evenings at Eight o'Clock:—

FEBRUARY 13.—“On Artificial Illumination.” By D. N. DEPRIES, Esq.

FEBRUARY 20.—“On the Water Supply of London as it affects the Interests of the Consumers.” By THOMAS BEGGS, Esq.

CANTOR LECTURES.

A course of Six Lectures “On Pottery and Porcelain,” illustrated by specimens of various manufactures, and by photographs and diagrams, is now being delivered by William Chaffers, Esq.

LECTURE IV.—MONDAY, FEBRUARY 11.

ORIENTAL PORCELAIN.—China, Japan.

LECTURE V.—MONDAY, FEBRUARY 18.

EUROPEAN PORCELAIN.—Italy, Germany, France, Holland, Belgium, Russia, Poland, &c.

LECTURE VI.—MONDAY, FEBRUARY 25.

ENGLISH POTTERY AND PORCELAIN.—Early History, continued to the beginning of the 19th century.

The lectures commence each evening at eight o'clock, and are open to members, each of whom has the privilege of introducing one friend to each lecture. Tickets for this purpose have been issued to each member.

ART WORKMANSHIP PRIZES.

In reference to the piece of *repoussé* work in iron (No. 15 in the list) to which the first prize had been awarded, the judges, Mr. Redgrave, R.A., and Mr. Digby Wyatt, met the workmen who had objected to the award (see last *Journal*, p. 162), and also Mr. Page, the successful competitor, on Tuesday morning last. It will be remembered that the objection raised was that the work was “not embossed from the flat, but struck in a cast die obtained from the plaster cast issued by the Society.” After hearing explanations on both sides, the judges decided that the work was fairly beaten from a flat plate of iron, and that it was not roughly beaten into a metal mould; and they considered Mr. Page had honourably earned his reward. The judges, moreover, considered that the means of getting the first rough beating of the plate was not important; the completion of the surface as a work of Fine Art, both as to relief and art feeling, being the true desiderata of excellence.

The works sent in competition for these Prizes are now placed in the Society's Great Room for the inspection of members and their friends.

EXAMINATIONS, 1867.

In addition to the prizes announced in the Programme of Examinations, the following are offered:—

The Worshipful Company of Coach and Coach Harness Makers offer a prize of £3 in Freehand Drawing, and a prize of £2 in Practical Mechanics, to the candidates who, being employed in the coachmaking trade, obtain the highest number of marks, with a certificate, in those subjects respectively.

The Worshipful Company of Goldsmiths offer three prizes—of £5, £3, and £2 respectively—to the three candidates who, being employed on works in the precious metals in any part of the United Kingdom, shall obtain from the examiners the first, second, and next highest number of marks, such prizes to be distinguished as the “Goldsmiths' Company's Prizes.”

INSTITUTIONS.

The following Institutions have been received into Union since the last announcement:—

Bolton, Science and Art School, Church Institute. Hulme, Working Men's Institute.

SUBSCRIPTIONS.

The Christmas subscriptions are due, and should be forwarded by cheque or Post-office order, crossed “*Countts and Co.*,” and made payable to Mr. Samuel Thomas Davenport, Financial Officer.

Proceedings of the Society.

CANTOR LECTURES.

“ON POTTERY AND PORCELAIN.” By W. CHAFFERS, Esq.

LECTURE III.—MONDAY, FEBRUARY 4.

Mr. Chaffers' third lecture was “On the Pottery of France and other countries.” He commenced by describing the peculiar and most original ware made at Oiron, near Thouars, from 1520 to about 1550, coeval with the best period of Italian maiolica, called *Henri II.* ware, which is of a distinct character and ornamentation to every other class of pottery. After briefly quoting the opinions of writers on the subject during the last 30 years, he alluded to the discoveries of Mons. Fillon, who solved the problem and cleared up the mystery as to the origin of this ware. Two artists assisted in the work, a potter, named François Charpentier, and Jean Bernard, librarian and secretary of Helène de Haugest Genlis. While in her service the latter had furnished numerous designs for ornamental bookbindings. After her death they entered the service of her son, Claude Gouffier, whose arms are found on a plateau in the South Kensington Museum. Mr. Chaffers next described the monograms, which are those of the Dauphin Henri, Anne of Montmorency, and of Claude Gouffier—the arms, emblems, and devices which are found upon the pottery of Oiron. He then spoke of the distinguishing characteristics of this curious ware, the body of which is a creamy white pipe-clay, very compact and of fine texture, so that it does not, like ordinary fayence, require an opaque white enamel, but merely a transparent glaze. Instead of being painted with enamel colours over the surface, it is actually inlaid with coloured pastes, in the same manner

as the champlévé enamels or niello work on metal. The lecturer continued—I will endeavour to give some idea of the complicated process of constructing a piece of this ware, from a very careful examination of a fractured specimen in the Sèvres museum. The foundation of the vase being first modelled into the required form by hand—quite plain and hatched all over with crossed lines, that the outer crust might the better adhere to it—one or more thin plaques or bands of moist clay were then laid on a flat board, corresponding in size to the portion of the vase to be covered. These plaques were stamped by the bookbinders' tools into various patterns. The string borders of frets, guilleches, foliated scrolls, rosettes, &c., were accomplished by swivel stamps, held in the hand, and rolled from one end to the other; the interlaced arabesques and diapered grounds were produced by means of metal stamps, such as were used for gilding the leather surfaces of books. These cavities or incised patterns were then filled in with different coloured clay, the superfluous portions being removed by a sharp chisel, and the bands were applied to the shaped foundation, and pressed closely to it. The next process was the application of ornaments in relief, such as brackets, masks, shells, terminal figures, &c.; these were either modelled by hand or pressed into moulds, and stuck on to the vase, together with the handle, and placed in the kiln for the first baking. The piece was then removed, and dipped into a thin, transparent lead glaze, with here and there some enamel tints of purple, blue, green and yellow, sparingly applied, and again subjected to a less degree of heat in the muffle kiln, sufficient to melt the glaze. From the manner in which the encrusted pattern was applied round the exterior of the vase, it would be next to impossible to make it correspond exactly at the junction of the two ends. This trifling irregularity has given rise to the supposition that the ornamentation was merely a printed design, transferred to the surface of the ware. This, to a superficial observer, appears very feasible; but if we look beneath the surface, and examine the section of the fractured vase at Sèvres, it is clear that the coloured pastes were inlaid, the sharp angles of the grooves or furrows presenting too regular an appearance to have been caused by the mere absorption of any colouring matter, either by surface transfer or with a brush. It will also be observed, that the furrows in which the coloured pastes have been inserted are slightly depressed, from shrinkage in the kiln, thus essentially differing from painted earthenware, which would rather produce a low relief. The number of pieces of this ware known to be in existence is 53. They are equally divided between France and England, each possessing 26. The odd one belongs to Russia. The lecturer next gave a detailed account of the methods adopted by the French potters in the fabrication of fayence, passing through all the gradations of mixing the clays, kneading, turning, baking, glazing, painting, &c., and the colours employed. He then gave short historical notices of the principal potteries, the products of each being exhibited, kindly lent to him by the following gentlemen:—Mr. H. G. Bohn, Mr. Durrant, Mr. Henderson, Mr. Slade, and Mr. Wareham. Beauvais was celebrated for its decorative pottery early in the fourteenth century, and is frequently alluded to in early inventories. Rabelais calls it the “Poteries Azurées;” and in the archives of Beauvais instances are recorded of presents being made to distinguished persons passing through the city. The elegant vases produced at Avignon, of quite an Italian character, were spoken of, and some of the finest examples pointed out. In speaking of François Briot, the lecturer said he was not only a goldsmith but likewise a manufacturer of fayence. His works in gold and silver have disappeared, but some of his extraordinary productions, both in pewter and in enamelled pottery, are preserved. His pottery has been erroneously attributed to Bernard Palissy, but it is a distinct manufacture, and executed

by Briot in a rival establishment. The enamel is more vitreous and transparent, the colours more brilliant and of a higher finish, and resemble enamel on metal. The most celebrated specimens were referred to, viz., a circular salver, belonging to Sir E. Marwood Elton; a piece in the Fountaine Collection at Narford; another sold at the Soltykoff sale for £400; as well as some smaller pieces by the same artist. The works of the celebrated Bernard Palissy came next under review, and the various scenes in his eventful life, from his birth, in 1610, until his death in the Bastille, in 1689, briefly alluded to, and his most important works described. To give some idea of the appreciation of true pieces of Palissy at the present day, Mr. Chaffers mentioned a round basin, with Diana of Poitiers *en chasseresse*, which brought in the Soltykoff sale \$292, and various other instances. Nevers was one of the most important *fabriques* of France, established in the 16th century, principally by Louis of Gonzaga, who brought from Italy expert artists in the arts of pottery, glass making, and enamel. The first potter established here, in 1571, was Dominique Conrade, of Savona, whose family continued the *fabrique*. Pierre Custode, in 1652, established another, and seven generations of this family were successively employed in it. In 1743 the number of manufactories was restricted to 12. In 1793, in consequence of the treaty of commerce between France and England, by which the English potters were enabled to pour in their earthenware at so cheap a rate that the French could not compete with them, added to which the price of lead and tin used in the glaze was raised by the English miners, all these disadvantages came so quickly upon them and upon all the *fabriques* of the South of France, that a panic ensued, and the trade of the French potters was irrecoverably ruined. In 1797, at Nevers, six had absolutely discontinued their works, and the other six were reduced to less than half their number of workmen. The different styles were then described, and some very fine specimens of the second epoch, 1660 to 1720, were exhibited, covered with a beautiful lapis lazuli blue, called “bleu de Perse.” The last period, down to the French Revolution, bears evident symptoms of decay, the pieces being covered with republican emblems, revolutionary and satirical sentences, and, as works of art, below criticism. Rouen was another noted manufacture of fayence early in the 16th century. Some tiles, dated 1542, painted with historical subjects, were alluded to, preserved at Orleans House, Twickenham; and the well-known specimens of the 18th century were amply illustrated, especially some pieces of a service manufactured for Louis XIV., who, having sold his plate to defray his heavy war expenses, had a fayence service made at Rouen in the forms of birds and animals, such as were usually served at table. The well-known fayence manufactory at Strasbourg, established by J. Hanung, in 1760, called in France “Poterie du Rhin,” was then spoken of, as well as the extensive potteries of Moustiers, of the 17th and 18th centuries, and the styles of all the periods distinctly pointed out and exemplified by specimens. Those of the beginning of the 18th century are the most artistic, being mostly painted in blue camaieu, with elegant arabesques, in the style of Jean Bérain, and André Boulle. Marseilles, another important manufactory, was in full activity early in the 17th century, and the names of the principal potters, and the styles of ornamentation were fully detailed. The potteries of Sinceny, Sceaux, Aprey, St. Amand, Vincennes, Sarreguemines, Niderviller, and other places in France, were also taken notice of in turn, and examples of modern French fayence of an artistic character, were exhibited, accomplished *au grand feu*, that is by one baking, at a great heat, which has this advantage, that the colours so fixed are indelible. Among modern artists may be mentioned MM. Jean, of Paris; Lavalle, of Premières; Deck, of Paris; E. Lesore, Rischgate, Bouquet, &c.

NINTH ORDINARY MEETING.

Wednesday, February 30th, 1867; Sir RICHARD MAYNE, K.C.B., Commissioner of the Police of the Metropolis, in the chair.

The following candidates were proposed for election as members of the Society:—

Hawley, J. P., C.E., Lambeth Water Works, Brixton-hill, S.

Hewitt, F. K., London Joint Stock Bank, 124, Chancery-lane, W.C.

Howse, Thomas, 19, St. Paul's Church-yard, E.C.

Schofield, William W., Buckley Hall, Rochdale.

Stirling, Sir Walter, Bart, 36, Portman-square, W.

The following candidates were balloted for, and duly elected members of the Society:—

Brereton, F. S., 5, Cannon-row, Parliament-street, S.W.

Briggs, Henry R., George-yard Wharf, 36, Upper Thames-street, E.C.

Brinjes, J. F., 25, Fieldgate-street, E.

Cawston, Samuel W., Balham-hill, S.

Grisbrook, W., 154, York-road, Lambeth, S.

Stanger, C., Harley-villa, Grove-street-road, South Hackney, N.E., and 8a, Worship-street, E.C.

The subject introduced for discussion was—

ON THE EXISTING LEGAL REGULATIONS IN REFERENCE TO THE CAB-FARES IN THE METROPOLIS, AND THEIR EFFECT IN RENDERING THE VEHICLES INFERIOR TO THOSE PROVIDED IN OTHER EUROPEAN CAPITALS AND THE LARGE MUNICIPAL TOWNS OF THIS COUNTRY.

By HENRY COLE, Esq., C.B.

Mr. COLE said for a long time past it had occurred to him that there were a multitude of subjects which might be profitably discussed by this Society, which were not of sufficient importance to warrant the formality of written papers. Moreover, there were many who, when the paper was written, were not qualified to give effect to it in reading—an art which had not been much cultivated in this country. He had put these views before the Council of the Society, and they had been induced to allow, as an experiment, for three or four evenings, the introduction of subjects without written papers. He conceived there were a number of subjects which members might like to bring forward in this manner, such as, for instance, "How far it might be possible to relieve passengers from having their baggage examined in going from England to France?" a subject of considerable interest just now. Another matter that might be suggested was "the visit of our working classes to the Paris Exhibition." We were now in the midst of contemplated plans for the building of a new National Gallery, but we had not yet determined what a National Gallery ought to contain. He thought that was another subject for discussion. There was also the employment of terra cotta in architecture, respecting which doubts were every day expressed whether it would last as well as stone. Then, again, some of the members might be able to tell them why it was that the milk and the butter of Paris were so much purer and better than those articles were in London. He merely threw out these hints to stimulate his fellow-members to assist the Council in a fair trial of this experiment. He had some trouble in framing the title of the subject which he proposed to bring before them this evening, and he might say that, as it now stood, it was not exactly his own. The question he wished to raise was not the interference of the law with the management of public vehicles, but with the question of fares. They were aware that the legislature of this country had thought fit to make a law that every cab must go for sixpence a mile. In his

opinion that was a great mistake, and against the experience of almost every other city and town in the kingdom. He did not want to go into the numerous questions of law connected with cabs, or the difficulty which the public had in getting redress against overcharges and such like questions. If any one wished to master all these points he commended to their notice a little book which had been sent to him, entitled "Handy Book of the Law relating to London Cabs and Omnibuses," by William Thomas Charley. There was also another point which he did not propose to enter upon. His friend Mr. Edwin Chadwick had written long and learnedly upon the question of competition, and had endeavoured to show that cabs ought not to be a subject for competition, but that there should be some kind of general authority to determine how many cabs there should be, what kind of horses should be driven in them, and other matters of that sort. He (Mr. Cole) would not stop to inquire whether the principle of competition "for the field" of service, as opposed to competition "within the field," was the right one. Neither did he intend to advocate that cabs should be left altogether to themselves, and be under no supervision whatever. He thought it was obvious that they ought to be placed under proper superintendence. What authority should exercise that superintendence was a subject he would not enter upon. There was the Lord Mayor in one quarter, the High Bailiff of Westminster in another, and the High Bailiff of Southwark in another, and Parish Boards and magistrates in all quarters. They thus had a variety of jurisdictions, and he did not express any opinion whether they were better or worse than an united municipality. These matters he did not propose to go into. He had, however, arrived at this conviction—that on the whole, we had in London the meanest cabs in the world. He would not go so far as to say they were the worst in the world, though they were very bad indeed. They occasionally found a Hansom, which went along pretty quickly, with a good driver, who would not charge the passenger more than double the ordinary fare; but he thought if by any means they could get up an exhibition of cabs from all parts of England, and from the principal cities of Europe, and marshal them in Trafalgar-square, those of the metropolis would stand very low in the scale. He found in the tenth report of the Commissioners of Inland Revenue an account of the London cabs, which might be considered the last version of the subject. At page 15 of that report the Commissioners said:—

"It must be admitted that our four-wheeled cabs are a disgrace to the metropolis of a great empire. It must also be admitted that the duty is very heavy, and that if the post horse duty were repealed or reduced, that on hackney carriages in London could not with justice be retained in its present shape. But it is at least very uncertain whether the public would thereby obtain any improvement in the class of carriages which ply in the streets. There can be no doubt that this trade is at present in a condition almost peculiar to itself; that capital is repelled from embarking in it, and that the number of needy men who set up a single cab and drive it themselves is increasing every year, while that of the larger proprietors is diminishing. In any other kind of business this state of things would not long exist. Open competition would secure for the good cabs the most custom and the best prices, and the dirty and rickety cabs would soon vanish from our streets. But the necessary conditions for this self-adjusting process are wanting. The prices are fixed by law at a uniform rate, and the public, for the most part, rarely exercise their right of selection when a cab is called; at all events not sufficiently to drive the inferior vehicle out of the trade. Under such circumstances it would seem that the only legislation which would secure for us the class of hackney carriages which would be creditable to the metropolis is to be sought in an extension of the powers given to the police, or in a more active exercise of their present power for prohibiting the use of objectionable carriages and horses."

It might possibly be well to increase the powers of the police; but he thought it better to allow the public and the cab interest to deal with the subject as between themselves, rather than to encourage a more active exercise of police powers as the remedy. The next witness that he would quote was their excellent chairman himself. Incidentally last year the cab question was raised before the

"Select Committee on the London (City) Traffic Regulation Bill," when Sir Richard Mayne said, in reply to several questions:—"The London cabs are bad" (247), "the fares are too low" (248). "I think differently now upon that point from what I once thought. I do not think there ought to be a sixpenny fare at all. I think the lowest fare ought to be 1s." (248). "The present system is not a good one" (250.) He (Mr. Cole) would not venture to say there ought to be no sixpenny fare, but that purveyor and customer should be left free to determine whether there should be such a fare. If anybody liked to run penny cabs, he did not see why the law should prohibit his so doing. He wanted the cab proprietors and the public to be allowed to settle the matter between themselves; and the mode in which that might be done he would endeavour to explain by-and-bye. He would only trouble them with one more witness on this part of the subject. Mr. Fitzroy, speaking in support of the Bill of 1853, had said:—

"In no capital of Europe were such carriages so entirely removed from all efficient control and supervision as in London. The consequence was a crowd of vehicles of a very inferior description, and with horses that had been graphically described by our first living novelist as only kept upon their legs by the rickety vehicles to which they were attached. The fare demanded for their use was excessively exorbitant. No change had been made in that fare since its first introduction in 1831. Amid the general—he might say universal—tendency towards reduction in articles of general consumption, two things had hitherto successfully resisted the tendency. One was the pint of extraordinary compound still called by courtesy a bottle of wine at an inn, and the other the fare paid per mile for the use of a hack cab. We were now arrived at a time when there was every reason for reducing that fare by at least 50 per cent., and he should therefore propose that it be fixed at 8d. per mile. Without giving any other reason, the decrease in the price of forage was alone sufficient to justify this. Oats, which in April, 1831, cost 23s. 10d., were now at 12s. 8d., having fallen between 20 and 25 per cent. But independent of the exorbitant amount of the fare, there were great objections to its nature in consequence of the broken money involved in the question. If you took a cab for a mile, you hardly dare meet the torrent of abuse that would be levelled at you if you failed to pay the driver 1s., and the consequence was that instead of 8d. the fare was 1s.; besides which, the hirers had no satisfactory means of ascertaining the distance they were taken."

He ventured to say that the supposed remedies administered by the Bill of 1853 had not given them the cabs which the legislature doubtless thought they would have had by this time. His own experience with respect to the four-wheeled cab was, that it was a rarity to get a good one. The cushions were rarely all of one colour, and on a wet day they were seldom dry. To find a button on the window, by which to lower the sash, was a happy accident. Draughty they were both above and below, and so shaky and noisy that conversation within them was carried on with great difficulty. The Hansoms were certainly quicker than the others, but they were extremely tight-fitting for two persons even of moderate bulk. No one could enter a Hansom without getting dirt on his clothes from the wheels, and the garments of ladies became besmeared with mud. Then if it rained there was the risk of having one's nose shaved off by the glass front being suddenly let down. Further, the springs were often weak and rickety, and he had travelled in many which made him feel as sick as going from Dover to Calais. To suppose these were matters which Sir Richard Mayne could investigate was out of the question; therefore there must be some other remedy found for them. His own experience was that the cabs were better in Birmingham and Liverpool, and very much better in Edinburgh. He was told that one reason for that in the latter city was that gentlemen did not usually keep their own carriages, because of the hills, and they found it better to hire public vehicles. Moreover, they got very superior cabs at Paris; and at Vienna they had a still better choice of vehicles. In London for open air driving they could only have the hansom cab, which was most inconvenient for ladies, whereas in Paris it was a common thing to see ladies reclining in an open vehicle called a Victoria, with four wheels, and a very pleasant kind of carriage it was. Why were there no such things in London? Owing, in his opinion, to the arbitrary inter-

ference of the legislature in fixing the amount of fares. All matters of buying and selling should be left between the producer and the consumer; the interference of the law in attempting to settle the price of things was against all sound political economy. He quite agreed with Sir Richard Mayne that a sixpenny fare was not a paying fare. In Birmingham he found a carriage on four wheels was entitled to charge 1s. for under a mile, if on two wheels, 8d. In Cheltenham, for a distance under a mile, 1s. was paid; with two horses it was something more. In Edinburgh the system was a little more complicated, but the pith of it was that one could travel half a mile in an ordinary carriage for sixpence. Going to Liverpool, he found two persons could travel a mile for 1s., and there (as was also the practice in London) a table of fares was placed inside the vehicle. In Manchester, where they might expect to see the full development of free trade in carriages as in other things, when anyone wished to start a cab he applied to the municipal authorities, to whom he stated at what prices he intended to run. Having declared that, he was bound to have the figures painted not less than an inch in height on the inside of the cab; that was all the authorities required. The average fare in that city was about 9d. per mile for two persons, and 1s. for more. He would now just call attention to the rate of fares and the working of the cab system abroad. In Munich there were two kinds of public vehicles—one called a droshky, and the other a fiaker. In Vienna there were three kinds of vehicles—one being the fiacre, and another a very superior carriage, which was used by the higher classes, the drivers being elegantly clad. In Brussels there were two kinds of public vehicles—the cab and the fiacre, the fares varying. In Dresden they had the fiacre and the droshky, the fares varying also according to the number of persons carried. He now came to a striking example, which he hoped all present would examine for themselves in the course of this year—the system in Paris. In that city they had a considerable variety of fares. Previous to last year he believed the public carriage business in Paris was a kind of monopoly, being chiefly in the hands of a company, who arranged to carry out the service according to the wishes of the municipality of Paris; but in 1866 the Emperor and his ministers came to the conclusion that it would be desirable to have cabs at different fares, so as to give the public a choice. They had two modes of charging in each description of carriage—one by the "course," and the other by the hour. The highest fare for the course was two francs, and for the hour 2-50 francs. When a person entered a vehicle the driver at once handed him a ticket, and did not want to be asked for it, as in London. Moreover, the inconvenience of the London system was avoided in cases of dispute. Here a man was dragged from a distance to appear at a police-court and prosecute a charge of overfare, and even then no settled decision had been come to by the magistrates as a body on various points. Mr. Cole here produced and read several cards issued by the various cab companies in Paris to their drivers, showing the variety of fares, 1 fr., 1 fr. 10 c., 1 fr. 40 c., 1 fr. 60 c., and 1 fr. 80 c. the course, and the same variety for the hour. In addition to them there was another class of vehicles in Paris at higher fares, called *voitures de remise*. These, instead of standing in the open streets for hire, were kept at certain intervals under cover, and a person hiring one of them was sure of a dry as well as a comfortable vehicle. With respect to the Manchester system, which might be called the free trade system in cabs, he had received a letter from the Town Clerk, who wrote:—

"It may be perhaps rather difficult to say that our present Cab Regulations Act is producing good and clean vehicles. I do not, however, think they are any worse than when the fares were in fact fixed by the Council. I do think the lowering the fixing of the fares to the cab proprietors has this good effect, that it does away with all ground of complaint that they are too low, or otherwise unsatisfactory. As a matter of fact, however, there is an uniform rate—8d. per mile for two, and 1s. per mile for three or four passengers."

etter had been received from a lady, expressing a hope that Mr. Cole would "explain why no open carriages for hire in London, as they do in other cities of Europe, as ladies are obliged to drive about in Hansoms, from the difficulty of getting open carriages, under 10 days' notice, from livery stables." If that lady did in the honour to read what he stated this evening she would find that her wishes had been met. The choice he had at present resolved itself into this—they must either put up with the Hansom or the four-wheeler, or they must hire a vehicle from a livery stable, for which they must pay 2s. 6d. per hour, and the driver expected shilling. To return to the subject of Mr. Fitzroy's Bill of 1853, Mr. Fitzroy, as above quoted, had said that he thought the eightpenny fare was exorbitant, and had proposed a reduction of 25 per cent. Just imagine the man stepping in, and telling people in any particular case that they must reduce their charges by 25 per cent! Was it not preposterous that the Legislature should step in, and, by an Act of Parliament, say a person should be compelled to do his business at a reduced price? Nothing could be more opposed to all sound political economy. The Bill did not pass, however, without considerable discussion, and he would read to them some portions of it. One of the opponents of the bill had said:—

"The bill was in violation of the very principle which his honourable friend and his colleagues prided themselves upon, namely, that of free trade, for they sought to adopt a maximum and minimum of fares which a particular class of the community should be entitled to receive."

And who did they think it was who uttered that sound sentiment? It was not Mr. Bright, but Sir Robert Inglis, one of the most staunch protectionists this country ever produced, and yet, when this measure was in the House, he had the courage to oppose it. He wanted to have the Bill referred to a committee, but the House of Commons desired the sixpenny fare, and they would not hear of it. Mr. Beckett Denison, who used to be called a Tory, was of opinion that the Bill ought to be sent before a Select Committee, as the only means of giving the cab proprietors an opportunity of stating their own case. He thought the House was not a competent tribunal to decide the matter without hearing the other side. But Sir R. Inglis and Mr. B. Denison were joined in this matter by no other person than Mr. Bright, who, speaking upon this Bill in 1853, said:—

"If he had not heard from the hon. gentleman (Mr. Fitzroy) an expression of great willingness to receive suggestions upon points of detail from both sides of the House, he would rather have seen the bill referred to a select committee. He thought, as most hon. members were great cab riders, and experienced personally therefore the inconveniences of the present system, they ought to be careful not to allow their individual annoyances to influence them in legislating upon this subject. In his opinion the unfortunate condition of cabs in the metropolis was to be attributed very much to the want of a proper municipal government in London. At present the drivers were exposed in our streets to all the vicissitudes of our often most inclement weather, whereas under proper municipal government the cab-stands would have been placed in wide streets, under a glass roof, where the men would have been sheltered from the weather. By this and similar arrangements a great improvement would have been effected in the characters of the drivers and of the vehicles."

He (Mr. Cole) must say he entirely agreed with the opinions expressed on this subject by the gentleman whose remarks he had just quoted. The view he now ventured to lay before the meeting was this, that it was desirable that the legislature should cease to meddle in such petty matters as this. He thought they had something else to do than to settle at what price a cab was to run. He was quite certain, if they took any further measures in this direction, it should be to leave the trade as free as possible, so that the competition might be as great as possible. He knew there had always been a great tendency towards this parliamentary meddling with the coaching traffic of the country. In the days of the old coaches and hackney-carriages, each interest was protected by penalties against the other for infringement of each others rights, in respect of the conveyance of

passengers within certain limits of distance from the metropolis. The hackney-coach was liable to a fine for going beyond certain distances, and the coach proprietors could not take up passengers within the hackney-coach limits. He approved of the continuance of the system of granting licences to cab-drivers, and that some authority should be in force to keep them to their bargain, as a guarantee, as far as possible, against imposition upon the public; but, at the same time, the cabowner must be the best judge of the price at which he could sell his article. He was aware there were practical difficulties in the way of carrying out this measure, but he thought they might be got over. They had different classes of railway travelling, which worked exceedingly well, and he saw no reason why the same system should not be applied to cab fares. The difficulties might be greater in London, from its peculiar circumstances, than in any other city. It might be a long time before they arrived at municipal government in the metropolis, but in the meantime they might get rid of that objectionable Act of 1853, fixing the uniform fare. He would not alter the present law in other respects. He did not advocate free-trade principles in this business without giving the public a remedy against extortionate cab-drivers. He therefore ventured to recommend the Council of this Society to urge upon the Government to appoint a committee to inquire into the whole subject of the hackney coach traffic. The Society had already done much for the improvement of the Patent Laws; of the laws of Art Copyright; as well as many other things of a similar nature; and he had no doubt if they were to take up this subject they would succeed in getting rid of the present unsound legislation, and thus aid in providing the London public with vehicles of a better class and in greater variety.

Mr. HILL said, when this subject was announced for discussion he expected it would have embraced a larger area than had been taken by Mr. Cole in his address. He had shut out every other consideration except that of fares, the point objected to being their limitation by law. It was the case in most of the Continental cities, and in the principal towns (and especially the watering-places) of England, that a municipal regulation of the cab fares existed. If it were argued that the cab business in London was unremunerative, because of the low fares, they ought to endeavour to see how it could be made more remunerative. He thought that would not necessarily follow from increasing the fares. The question was how they could create a larger demand for cabs on the part of the public. At present, from some cause or other, there was a disinclination to use cabs, and he mentioned cases under his own observation in which people arriving at a railway terminus preferred walking to their destination, even in wet weather, to the detriment of valuable clothing, rather than take a cab. He believed this repugnance to cabs arose, in the first place—especially in the case of ladies—from the frequent disputes that took place about fares. A remedy for this, to a great extent, would be found by some instrument being attached to the cab, by which the distance travelled would be indicated, and he thought it was quite within the province of this Society to endeavour to obtain such an instrument and get it adopted. He had no doubt cabs would be more generally used by the public if some means were provided whereby the disputes with cabmen could be avoided.

Mr. Alderman LAWRENCE, M.P., felt much indebted to Mr. Cole for having brought this subject before the Society, because, though at present it might seem a small matter, yet it was in reality a large question, affecting the comfort and convenience of great numbers of people; not the inhabitants of London alone, but those who visited the metropolis from all parts of the world. He considered it was incumbent upon them to endeavour to provide in this metropolis as good accommodation in respect of public conveyances, as was to be met with in the great continental cities. The evils of the present

system of cab traffic were universally admitted, and the evidence on all sides went to prove the fact. It was alleged that capital was not largely embarked in this branch of business: that was simply because it did not pay to put capital into it. Irrespective of the question of fares, there was another matter which bore materially on the subject. The Chancellor of the Exchequer exacted a large amount annually from the cab proprietors of London—a tax from which the same class in the provinces was exempted. In London there was a tax levied of a shilling per day on every cab, which was only remitted in respect of cabs which did not work on Sundays. In the country they merely paid the post-horse duty on a certain scale, according to the number of horses and carriages kept. Last year, when the Chancellor of the Exchequer reduced the duty on omnibuses, he also reduced the post-horse duty, which before went by jumps, and gave an unfair advantage to those who had a large number of horses and carriages. Up to last year, when the duty of one penny per mile existed upon omnibuses, calculating each omnibus to run 320 or 330 days in the year, it paid something like £66 per annum. That was reduced from £66 to one fourth, or £16 10s. Each omnibus employed eight or nine horses, and a cab only two, yet the cab was saddled with a tax of a shilling per day, which, for six days in the week, amounted to about the same sum as that paid by an omnibus under the reduced scale. Not only was there this undue pressure of taxation upon cabs, but the legislature had reduced the fare to a very low amount. Under the extended police regulations with regard to cabs which were provided for by the Act of 1853, it was expected that a great improvement would have taken place as regarded the vehicles, the horses, and the appearance of the drivers; but the reduction of the fare caused the cab business to dwindle down, the horses and vehicles were worse, and the drivers were men of a lower grade; and it continued to dwindle down till it was found to be an unremunerative investment of capital. There was another grievance under which cabmen laboured. In the metropolis the cabman who neglected to pay the owner for the daily hire of the cab was liable to arrest for the debt, and summary process before a magistrate led to his committal to prison for a certain number of days. In Whitecross-street prison there were generally from five to twenty such prisoners. Such a system of arrest and imprisonment was, in the present day, wholly exceptional. What was the consequence of this system as regarded the public? The cabowner, knowing he had this summary power over the men, took less trouble than he would have done to inquire into their characters, and the driver, knowing there was a prison before him in case he did not keep up his payments to the owner, extorted as much as he could from the public, in the way of over fare. All these things operated in the end against the public. If the fare was too low to be remunerative, the tariff ought to be revised by Parliament. The Home-office had taken this matter under its control, and it was their duty to see that the public were well served. This, he believed, was the only matter in the metropolis which the Government had taken into its own hands; and with all the progress of local management, it had never permitted the Corporation of London, or the local authorities of any of the districts of the metropolis, to interfere with the settlement of the regulations for the management of hackney carriages; and in his opinion this management was as bad as it could be. The question now was as to the remedy. It appeared to him that the first step was to place the public carriages of the metropolis in as a fair position as those of the large provincial towns, and remove from them the present excessive taxation. He believed that with this burden the present fares were somewhat too low, but if the taxes were reduced, he thought they might retain the six-penny fare; at the same time the public should have the opportunity of engaging a superior class of carriage at

an increased price. He could not agree with Mr. Cole that anybody who chose should be allowed to start cabs at any fares they thought proper to fix. He approved of the suggestion that a superior class of vehicle should be provided at a higher scale of fares—an arrangement which would largely promote the convenience of the public.

Mr. C. SANDERS, who introduced himself as being formerly a cab proprietor in Paris, enumerated the various classes of public vehicles now employed in that city, and the rates of fares charged for them.

Mr. FREDERICK HILL said some years ago, being a member of the Society for Promoting the Amendment of the Law, he made inquiries into this subject, with a view of introducing it for discussion before that society, and the result of those inquiries brought him to the same conclusion as that which Mr. Cole had arrived at, viz., that the interference of the law in the matter of cab-fares was a mistake. In many similar matters the law formerly interfered, but that interference had been gradually withdrawn; and they had proof of the wisdom of that step in the fact that in no one instance, as far as he was aware, had it ever been proposed to re-establish legal interference whenever it had been abandoned. That, he thought, was a great encouragement to them to go forward in the same direction, and apply the principle in the case of cabs. If there were any who thought otherwise, it was incumbent on them to make out their case on the other side of the question. With regard to the effects of the unequal taxation alluded to by Mr. Alderman Lawrence, what in the natural state of things was the effect of imposing a tax upon an article? It was that the price of the article to the consumer was enhanced. If a heavy tax was laid upon cabs the customer had to pay something more; the owner of the article was only injured to the extent that the increased cost of it probably led to a less demand on the part of the public. It was stated that in no case were good cabs to be obtained without a suitable tariff of fares. Mr. Cole had referred to Manchester as a place in which the cab system was very admirably worked, and he could strongly confirm that statement. Those who visited that place, at the Social Science Congress, could not fail to have witnessed the excellence of the system there, more especially the short distances that intervened between the cab stands. There were other evils of the present system in London which had not been touched upon. One great disadvantage arising from the absurd attempts of the legislature to undertake the task of determining what should be the market price, under all the varieties of cost, of an article was this—that it drove the business into the hands of a low class of people. They (the cabmen) were often dishonest, and to his own knowledge foreigners especially were fleeced to an enormous extent, while an honest cabman could hardly make a living. Although he was obliged to ride in cabs a good deal, he always did so with reluctance. He had frequently left articles in cabs, but he never knew an instance in which his property had been returned to him, and he was in the habit of often submitting to overcharge in order to avoid contention.

Mr. WEBBER said there was one point omitted in the discussion in connection with the reluctance of the public to use cabs in London, and that was the crowded state of the traffic. If it were a question of time whether one should walk from Regent-street to the City or take a cab, he thought the decision would be in favour of walking. He referred to the damage which was inflicted upon trade conveyances in localities like Ludgate-hill and the bottom of Fleet-street, and expressed his opinion that the operations of the police-officers at that point of intersection of the immense traffic were rather productive of confusion than otherwise. He thought, as affecting the extent of the employment of cabs by the public, the circulation of the traffic was an important element, and it was a paramount duty on the part of the authorities to provide a remedy for this evil.

Mr. W. BOTLY expressed his concurrence with most of what had fallen from Mr. Cole, and agreed that the less of legislative interference there was in a matter of this kind the better. With regard to the honesty of cabmen as a class, his own experience had been of an opposite kind to that mentioned by Mr. Hill.

Sir OUSACK RONEY said they had heard a good deal this evening about the bad state of the cabs and the questionable character of the cabmen. Although travelling a great deal in their vehicles he had not been so unlucky as some gentlemen who had spoken, and he generally found the men were satisfied with the proper fare, or a little above it. As to the honesty of the men as a class, though he did not appear there as their advocate, he would remark that no one was in a better position to give an opinion on this point than the Chairman. Many instances were given in the police reports of robberies having been frustrated through the integrity of cabmen. Only the other day the Assistant-judge highly complimented a cabman for his great honesty and integrity in a case that came before him. He (Sir C. Roney) had been twenty-five years connected with railways, and on his first becoming connected with them, a member of the board of which he was then secretary said to him, "Now, remember this—the persons travelling up and down your line will tell you that it is the worst managed railway in the kingdom; and if you go to another line the people travelling by it will tell you the same of that line." He had travelled abroad a great deal, and he could tell them that foreign cabmen were not the specimens of immaculate perfection which some people imagined them to be; the cab-drivers of Brussels, and even of Paris, knew as well how to overcharge foreigners as any English cabman did. He believed the only place in which there were really honest cabmen was Dublin, of which he was a native. He might mention that the word "fiacre" was derived from the fact that in the year 1660 a man of the name of Beauvois obtained a license to work hackney carriages in Paris, and he resided at a house called the Hotel de St. Fiacre, and from that circumstance the hackney carriages were called fiacres. St. Fiacre was an Irishman of noble family; in fact, descended from Irish kings; he went to Paris in the seventh century, and his reputation there was of the most saintly character. He would not, at this late hour, trouble them with any further observations.

Mr. ELT, in reference to the remarks of the last speaker, had great pleasure in bearing his testimony to the integrity, civility, and intelligence of the car-drivers in Dublin. With respect to the general question, he gave his emphatic thanks to Mr. Cole for his advocacy of free-trade in cabs under proper regulations. He thought as a class the cab-proprietors as well as drivers were placed under many disadvantages. Omnibuses were allowed to fix their own fares, and, as had been the case during the late severe frost, to increase them 50 or 100 per cent. A Hansom cab, which could carry only two passengers, and had consequently never an opportunity of charging for extra passengers or luggage, was at a disadvantage as compared with the four-wheeled vehicles, capable of carrying four persons and a considerable quantity of luggage, for which extra fare could legally be demanded. He suggested the desirability of the employment of a tell-tale to indicate the distances travelled, so as to avoid all disputes with the drivers.

Mr. CAMPIN, with reference to the taxation imposed upon cabs, thought that was to a certain extent compensated by the privilege they had of standing for hire in public places. That was a thing which took the case out of the ordinary course of trade, a special privilege being thus conferred.

Mr. HARTLEY, in reference to the tax of 1s. per day upon cabs, would ask whether the chairman did not consider that was a great inducement to the Government to license as many cabs as possible for the sake of the

revenue, and whether, under such circumstances, the number of cabs might not be unduly multiplied.

The CHAIRMAN, in closing the discussion, said, as to the Government having any interest in the number of cabs, that never entered into their calculation. There was no limit fixed to the number of licenses which were granted by the Board of Inland Revenue, upon an undertaking being given for the payment of the duty. Under the Act of 1853, which had been rather severely dealt with that evening, it was required that it should be certified by the Commissioner of Police that the vehicles licensed were, in all respects, in a fit condition for public use; but that regulation was evaded in many instances by another cab than that which was licensed being submitted to the police inspector, and the certificate thus fraudulently obtained. He agreed with Sir Ousack Roney that the car-drivers in Dublin were a very civil and honest set of men in general. He considered the system of fares by the "course" the one best calculated to avoid disputes; but he believed that to be inapplicable in a place of the vast extent of London, though, at the same time, payment by distance must necessarily lead to disputes, and, in the case of strangers, to overcharge. Mr. Cole had put into his hand a description of a tell-tale instrument, made at Birmingham; but whether it was an apparatus adequate for the purpose he was not able to say; if it was so, its use would, no doubt, be a great benefit. Several such contrivances had been brought under his notice at different times, but he had no legal power to compel cab owners to make use of them, and there was an universal feeling on the part of such persons against their adoption. He was sure all present must have been gratified by the spirit in which this discussion had been carried on, and the intelligence and consideration that had been displayed throughout. One thing he thought had been clearly shown, viz.:—that whilst it was easy to make complaints, when they came to the attempt to discover the remedy, the task was one of great difficulty. The only town in which the principle of free-trade in this business was adopted was Manchester, and there it had only lately been tried—so lately, he believed, as the year 1846—and so far as he gathered from Mr. Cole's statement, this had resulted in the establishment of two classes of vehicles, the fares not being regulated according to the quality of the carriage, but according to the number of persons to be carried. That, he thought, was not the object sought to be gained. The object was, that they should have two classes of fares—one for persons who wished to travel at the cheapest rate, not caring much about the equipment and convenience of the vehicle, and the other for a carriage of a superior kind. It might be difficult to arrive at this result, but that it was desirable to attempt it he felt most strongly. He believed an opportunity would be afforded shortly in Parliament in connexion with the Bill that was to be introduced this session with regard to street traffic, for suggesting some alterations with respect to cabs and cab-fares, and he was sure the official authorities by whom that Bill would be brought into the House would be willing to listen to any proposals that were likely to benefit the public. He would make one additional observation in justice to the cabmen, who, he must say, in very many cases, were extremely hardly dealt with. Cases frequently came within his knowledge in which he thought the law had been pressed very rigorously—not to use a stronger term—against them. With regard to their honesty as a class, anybody who took the trouble to inquire at Scotland-yard would find that hundreds of deposits of lost articles were made there, and there was scarcely a day passed in which such property was not restored to the owners, sometimes to the value of several hundreds of pounds. He thought it was only fair to state this in justice to a class of men who were often undeservedly maligned.

Sir OUSACK RONEY writes as follows:—Feeling that I

was not entitled, at the late hour at which I addressed the meeting of the Society of Arts last evening, to occupy its attention for more than four or five minutes, and also feeling it an act of justice to offer some observations in defence of London cabmen, I was unable to speak upon the points which I had intended to bring under notice. Perhaps I may now do so by letter to you. All experience in every city, as well in England (with one exception) as on the Continent, shows the necessity of having a fixed tariff for public vehicles. Were it otherwise, the extortion to which the public, but especially females and strangers, would be subjected would be endless. The variety of public carriages stated to exist in Paris may be agreeable, but it is perplexing even to persons well acquainted with the city. For example, it was stated at the meeting that there are carriages to hold two persons at 1 franc 50 centimes the "course," and carriages at 1 franc 80 centimes. But these carriages are identical, the fact being that if a person takes one from a public stand, or in the street, the fare is 1 franc 50 centimes, but if a person takes the self-same carriage at the under-cover stand, or *porte-cochère*, the fare is 1 franc 80 centimes. There are no less than three different tariffs for *voitures à quatre places*. These varieties of fares render it almost impossible for strangers, especially those not conversant with Paris and with the French language, to understand them; and even with such knowledge people are not always able to do so. The only city, I believe, in Europe, in which the owner of a public carriage may fix his own fares, is Manchester. This is called free trade, and it may be so, but it does not bring with it the usual concomitants of free trade, which are increased business and diminished prices, for the prices of cab-hire in Manchester are at least as high as in the other commercial cities of Europe; and as regards the cabs, the horses, and the drivers, they are not superior to those in Liverpool, Birmingham, &c. But Manchester itself is a city that possesses two monopolies of the most complete character—the supply of water and of gas. These belong to the Corporation, which largely relieves local rates out of the profits derived from these two sources. The arrangement is, no doubt, an extremely good one, both for the city and for the inhabitants, and it is one that might perhaps be beneficially employed elsewhere, but it is manifestly not "Free Trade." London cab-owners labour under a disadvantage not shared in by their brethren of any other city or town, whether metropolitan or provincial, in Europe. They alone are not permitted to charge extra fares during certain hours of the night. Usually such fares are double, but they are never less than an addition of two-thirds of the day fare. Individually I believe that if the minimum fare were one shilling, and the oppressive irregularities so well pointed out by Mr. Alderman Lawrence, M.P., were removed, the cab standard would be greatly improved, and the public would have a vehicle that on the whole would fairly fulfil the ordinary wants of the public. If we ascend to the regions of luxury we must pay accordingly. The practical operation of the sixpenny fare has been to raise in *limine* an antagonism between the cab-owner and cab-hirer, especially with that portion of the community whom it is necessary to protect. But, truth must be told; cabmen will invariably tell any person who converses with them on the fare question that for one man who pays sixpence twenty females will avail themselves of the rate, and in those cases an exact mile is usually extremely well known. The present law as regards more than two persons riding in cabs, and payment for luggage is, undoubtedly, beneficial to the cab-owner.

PARIS EXHIBITION, 1867.

The last four weeks have produced a great change in the appearance of affairs in the Champ de Mars; the

grand vestibule, or nave of the building, is finished as regards the material portions and most of the painting and glazing also. This vestibule forms the division between the French department on the left hand, and the English on the right, and is to be devoted principally to the illustration of the history of the earth. But the grand vestibule will not be the lion of the exhibition of 1867; its roof is heavy and inelegant, and no ingenuity in the way of decoration is likely to produce much effect. The sides are too much enclosed, and the clerestory windows being at a great height from the ground, the lower portion will be too much in shadow. The feature of the building is the great machinery court; compared with this, the vestibule is nothing.

The mode of colouring adopted cannot be said to be fortunate; in the machine gallery the tones are too flat, and the main lines are not sufficiently indicated. There is a patchiness about the decoration of the interior of the roof which is peculiarly disagreeable; the great pillars, on the contrary, being painted simply of white or light cream colour, relieved by vermillion, look bold and well. The outside of the building is being coloured dark red, with panels and lines in maroon, or reddish brown, but the effect is poor and flat. Artists have not yet learned how to colour acres of iron work, and no wonder; it is a problem probably without a solution, from an artistic point of view.

The heavy chocolate colour of the intermediate courts is fatiguing to the eye, but as our neighbours are covering it all up with wood work it matters but little.

A curious contrast will be presented by the English department, which will be totally different from all the other portions of the exhibition; the whole of the iron work in the British industrial courts, and the walls of the picture gallery, have been painted of a dull green colour inclining towards olive. There is no doubt that this tint will suit works of art admirably, and it promises to harmonise well with the dark red colour selected for the counters. The contrast will be rendered still greater by the fact that while the French and many of the other industrial courts will form series of rooms rather than galleries, the British department will present a large space with scarcely anything to obstruct the view but the objects exhibited; and, while other countries group their exhibits in a more or less artistic manner, the British exhibitors will act independently and doubtless show considerable diversity. The contrast will be instructive in more ways than one, and in that view its existence is an advantage.

The Russian department presents a third aspect which deserves notice; the commission, like that of England, has kept the whole of its space unobstructed by walls, partitions, or enclosures of any kind, except rails three feet high, while its entire fittings are harmonious. The commission has, in fact, made the woodwork of its court a magnificent exhibition of the peculiar style of the ornamental furniture of the country. There is a series of noble presses, with boldly-executed pillars and pilasters, enormously massive tables, square, octagonal, and oblong, with legs, brackets and pedestals to correspond, stands for glass cases, and the cases themselves, all in perfect keeping, not only with each other, but also with the massive wooden railing which surrounds the entire court. The whole of these are formed of ordinary wood, the decorated portions being of the same material as the solid parts. The ornaments are of the mixed Byzantine and Greek style proper to Russia, and are nearly all produced by the saw; there is no carving whatever employed; end-pieces, knobs, and other parts are turned, but all the rest of the ornament consists either of open pierced work, or of the same laid on the framework of the furniture, thus producing bold and simple patterns. It is not usual to colour or even varnish such furniture, but the hollows are generally painted in positive colours, and the whole of the surface left of the natural colour of the wood.

Two other foreign courts also begin to exhibit a

eculiar and characteristic appearance. The Turkish and Egyptian department is divided into compartments, each having a decorative frieze in plaster work; while the Danubian principalities—Moldavia and Wallachia—present a series of kiosks, or rather verandahs, for they only project a few feet from the wall, decorated with interlaced ornaments in brilliant colours, heightened by gilding.

The English department has now got to work. The mappers have covered the floor with well-known names, and cases, tables, and counters are being rapidly got into their places. London is first in the field, Mr. Drew having opened the campaign with forty cases of fittings a day or two since. A court is being prepared for the musical instruments, and there is little doubt that in a very short time there will be few square feet vacant on the British side. The commission has brought over a steam traversing crane, in order to expedite the getting in of the heavy goods, a contribution towards the means of preparation for which our neighbours ought to be grateful, as no doubt they are.

The preceding leads naturally to an admirable arrangement of the Imperial Commission itself, and which was incompletely noticed in the *Journal* on a former occasion, namely, the service railway of the exhibition. A line is laid down entirely around and close to the building, as well as around the interior of the great machinery court; two branches connect these concentric lines with the railway station just outside the grounds, while small connecting lines join the two circles at the principal entrances of the building, all the junctions being supplied with turntables. This complete system is permanent, that is to say, for the whole term of the exhibition. When the preparatory work is all done, the rails will all be filled in and covered with gravel, or otherwise, and so remain until wanted again for the dispersion of the contents of the exhibition.

The arrangements for the convenience of visitors are as remarkable as that just mentioned in connection with the work of the exhibition, and deserve special notice. In the first place there are no less than fifteen gates, or rather entrances, to the grounds of the exhibition, and sixteen doors to the building itself. Of the former, twelve lead from the surrounding roads, two from the river, beneath the quay, and one from the railway station. As already stated, those who arrive by rail will be able to reach the building by a long corridor running half the length of the park; on the opposite side, the arrangement for those who arrive in carriages is still more admirable. The straight side of the building is only about 360 feet long, and includes three entrance doors, while the slip of ground between it and the road is little more than a hundred feet wide. The commission has taken good advantage of these circumstances. A light wooden erection, as long as the side of the building, and as high as the surrounding *marquise*, has been constructed with three transverse roofs leading to the three doorways, so that carriages will set down under shelter, and the visitors may enter by either of the three cross passages. The intervals between these passages, or rather corridors—for the sides will, apparently, not be enclosed—are to be planted with flowers.

The great size and complicated form of the building and grounds render it necessary to give names to the various avenues and promenades; thus we have within the building the streets of England, India, Russia, Africa, Spain, Austria, Prussia, Belgium, Holland, France and several of its provinces, while the central avenue in the grounds is called the Avenue d'Europe, and the principal promenade the *Chemin Circulaire des Deux Mondes*; the other walks are named in like manner—avenues of Germany, United States, the East, and Burgundy; and alleys of Scotland, Ireland, Japan, Morocco, Tunis, Brittany, and so on throughout.

In the various portions of the building are being marked off by immense painted boards, one for each of the ten sectors of the building, thus:—"No. 13" con-

tains "Italy, Turkey, Egypt, China, Japan, Siam, and Africa;" while Nos. 16, 15, and half of 14, are occupied by great Britain and Ireland.

The grounds are not at present in a condition for the promenade, except in navy's boots, but the works are going on with great rapidity. Nearly all the buildings on the French side are finished, and the others are generally in a finished state. The most conspicuous are the mosque of the Sultan and the temple and kiosk of the Viceroy of Egypt, forming one group; the pavilions of the Bey of Tunis and the Emperor of Morocco; the highly curious model-houses and other buildings of Russia; the house of Gustavus Vasa, in Delectaria; the Swiss restaurant; and the fine-art galleries of Belgium and Holland. These are all finished, or nearly so, but their description must be reserved for a future occasion.

The twelve boiler houses will all be finished shortly—steam was got up a few days since in one of the French boilers; those of Messrs. Galloway, of Manchester, are now being placed in position.

Another department of the Exhibition is progressing rapidly, namely, the botanical garden; the main work of the great aquariums is all but finished, the iron framework of the great glasshouse is in place, and several smaller ones are built, and ready for glazing; the artificial canal is completed, and in some parts of the garden the flower-beds are formed, and the paths gravelled.

The preparations for the refreshment of the world exceed almost any other department in their proportions. In the alimentary court, under the great *marquise*, there are now constructing five French, three or four English, one Russian, and several other *cafés, restaurants, buffets, &c.*; in the grounds there will be Austrian, Swiss, Italian, Egyptian, and, it is said, Chinese places of refreshment; and lastly, by the side of the river, are two other very large *restaurants*.

INDUSTRIAL EXHIBITION OF THE NORTH-WEST PROVINCES OF INDIA AT AGRA.

This exhibition, which is the largest and most complete that has taken place in India, has just been opened. The following is the official announcement as to its objects and the prizes offered:—

The object of the exhibition is to bring together, for show and competition, cattle and other live stock, agricultural implements and machinery, articles of Indian agricultural and forest produce, and specimens of industrial manufacture and art; also to afford an opportunity for comparison between the productions of the north-western provinces, Oude, and the dominions of the chiefs of Central India and Rajpootana.

The exhibition will be arranged in five departments, viz.:—

- I.—Live stock.
- II.—Agricultural and animal products.
- III.—Forest and mineral products.
- IV.—Machinery and implements.
- V.—Arts and manufactures.

These departments will be severally subdivided as shown in the classified list appended.

The exhibition will be opened on Monday, the 4th of February, and will be closed on Saturday evening, the 9th. On both the above days an entrance fee of one rupee will be paid by all except the members of the central committee, the curators, jurors, and members of district and divisional committees. On the intermediate days the exhibition will be free to all.

The exhibition will be open to competitors from all parts of India.

Prize List of the North-Western Provinces Industrial Exhibition, to be held at Agra, commencing February 4th, 1867.

DEPARTMENTS, CLASSES, &c.

Department I.—Live Stock.

CLASS 1.—Horned cattle, 4,500 rupees.

- CLASS 2.—Horses and mules, 3,250 rupees.
 CLASS 3.—Sheep and goats, 1,400 rupees.
 CLASS 4.—Elephants, 300 rupees.
 CLASS 5.—Camels, 150 rupees.
 CLASS 6.—Poultry, pigeons, and rabbits, 500 rupees.
 Prizes for Department I., 10,100 rupees; first-class medals, 20; silver ditto, 68.

Department II.—Agricultural and Animal Products.

SECTION A.—RAW.

- CLASS 1.—Country dairy produce, 200 rupees.
 CLASS 2.—Grain, 450 rupees.
 CLASS 3.—Pulse, 350 rupees.
 CLASS 4.—Tubers, 400 rupees.
 CLASS 5.—Fibres, 500 rupees.
 CLASS 6.—Cotton and wool, 500 rupees.
 CLASS 7.—Silk (raw) and silkworms, 100 rupees.
 CLASS 8.—Dyes, 250 rupees.
 CLASS 9.—Oil seeds, 90 rupees.
 CLASS 10.—Tobacco in leaf, 80 rupees.
 CLASS 11.—Sugar-cane and raw sugar, 50 rupees.
 CLASS 12.—Honey and wax, 30 rupees.

SECTION B.—MANUFACTURED.

- CLASS 13.—Tea, 400 rupees.
 CLASS 14.—Tobacco, 150 rupees.
 CLASS 15.—Sugars, 150 rupees.
 CLASS 16.—Preserves, 200 rupees.
 CLASS 17.—Oils, 100 rupees.
 CLASS 18.—Drugs, 100 rupees.
 CLASS 19.—Country-brewed malt liquor, 50 rupees.
 CLASS 20.—Spirits, 50 rupees.
 CLASS 21.—Perfumes, 100 rupees.
 CLASS 22.—All other products pertaining to this department not already enumerated, 200 rupees.
 Prizes for Department II., 4,500 rupees; first-class medals, 5; silver ditto, 50.

Department III.—Materials used in Construction and Forest Produce.

- CLASS 1.—Specimens of timber, 150 rupees.
 CLASS 2.—Ditto stone for building, 150 rupees.
 CLASS 3.—Ditto lime and kunkar, 75 rupees.
 CLASS 4.—Iron, copper, &c., 300 rupees.
 CLASS 5.—Jungle fibres, 25 rupees.
 CLASS 6.—Saltpetre, 50 rupees.
 CLASS 7.—Gumlac, 50 rupees.
 CLASS 8.—All other forest products not enumerated above, 200 rupees.
 Prizes for Department III., 1,000 rupees; first-class medals, 2; silver ditto, 8.

Department IV.—Machinery and Implements.

- CLASS 1.—Native engines, 1,000 rupees.
 CLASS 2.—Implements for tillage, 500 rupees.
 CLASS 3.—Hoing, drilling, and sowing machines, 100 rupees.
 CLASS 4.—Harvesting machines, 100 rupees.
 CLASS 5.—Implements for preparing produce for market, 650 rupees.
 CLASS 6.—Farm yard implements, 150 rupees.
 CLASS 7.—Machinery and implements for irrigation, 800 rupees.
 CLASS 8.—Agricultural carriage, harness, and gear, 350 rupees.
 CLASS 9.—Dairy implements, 100 rupees.
 CLASS 10.—All other implements and machinery used for agricultural or kitchen purposes not entered above, 250 rupees.
 Prizes for Department IV., 4,000 rupees; first-class medals, 3; silver ditto, 15.

Department V.—Arts and Manufactures.

SECTION A.—MANUFACTURES.

- CLASS 1.—Cotton fabrics, 1,000 rupees.
 CLASS 2.—Woolen ditto, 1,000 rupees.
 CLASS 3.—Silk ditto, 850 rupees.
 CLASS 4.—Embroidered ditto, 650 rupees.
 CLASS 5.—Fibrous manufactures, 500 rupees.

- CLASS 6.—Jewellery, 400 rupees.
 CLASS 7.—Hardware and cutlery, 200 rupees.
 CLASS 8.—Porcelain and pottery (bricks, tiles, &c.), 200 rupees.
 CLASS 9.—Glass manufacture, 150 rupees.
 CLASS 10.—Furniture and upholstery, 250 rupees.
 CLASS 11.—Ornamental carving in wood, ivory, stone, 100 rupees.
 CLASS 12.—Inlaid work in marble, wood, &c., 20 rupees.
 CLASS 13.—Leather manufactures, 500 rupees.
 CLASS 14.—Paper of country manufacture, 150 rupees.
 CLASS 15.—Fancy work in paper, wax, worsted, bamboo, cane, beads, &c., 100 rupees.
 CLASS 16.—Arms and accoutrements, 200 rupees.
 CLASS 17.—Conveyances, 400 rupees.
 CLASS 18.—Thermantidotes, punkahs, tattoe watering appliances, and all other house-cooling apparatus, 500 rupees.
 CLASS 19.—Tents, 400 rupees.
 CLASS 20a.—All other manufactures, not included in the above, 400 rupees.

SECTION B.—FINE ARTS.

- CLASS 20b.—Models and statuary, 500 rupees.
 CLASS 21.—Engraving, printing, and lithography, 200 rupees.
 CLASS 22.—Photography, 400 rupees.
 CLASS 23.—Manuscripts, drawing, and painting, 200 rupees.
 CLASS 24.—Specimens of other fine arts, 150 rupees.

SECTION C.

- CLASS 25.—Machinery, and all other instruments used in arts and manufactures, and for scientific purposes, 300 rupees.
 Prizes for Department V., 10,000 rupees; first-class medals, 30; silver ditto, 100.

A FOREIGNER'S VIEW OF ENGLISH RAILWAY MANAGEMENT.

The following extracts from a letter to the *Kölnische Zeitung*, will give Englishmen some notion of the appearance of their country from a German standpoint:—

Speaking of a journey to Chester by the London and North Western, he says, "The neighbourhood of London thus far is uninteresting. It is true there is plenty of bright green meadow land, which is rarely absent in the midland and southern counties, but otherwise the country is flat, tame, and monotonous. Charming landscapes, however, would fail to attract attention, if in passing by Harrow and Rugby one were to reflect how little is taught and learnt in these celebrated schools, how miserably, on the whole, school education is managed in England, and how difficult it is to solve the riddle how so many able, learned, practical, and renowned men should have gone forth from these monastic, richly-endowed, flogging schools (Prügel-schulen), in which there is nothing solid but the leg of mutton and the old customs.

How much, to give only one instance, could not the managers of English railways learn from the Germans, and these again from the English! I do not mean in great things, such as the construction of locomotives, tunnelling, bridges, signalling—for these things are so important that the engineers of both countries are always on the watch trying to spy out all improvements—but I refer to small things which are useful to the company's servants and travelling public, without necessitating any expense worth speaking of. For many years, and especially since the robbery and assault by Müller, Englishmen have been racking their brains to discover the best means of communication between the passengers, guard, and driver. They have made endless experiments, with this object in view, with all sorts of neat but complicated and expensive apparatus, some electrical, some with concave mirrors, others with

rockets, but up to the present time most railways have not got beyond the experimental stage. Very few companies have adopted the simple cord from the guard's van at the end of the train to the whistle on the engine, because it causes too much delay if carriages have to be put on or taken off at intermediate stations. No company has yet been able to make up its mind to the foot-board running all the way along outside the carriages, which qualifies the Prussian guards for peripatetics. Such an arrangement would prevent many a stoppage at a station, and would furnish an easy means of controlling the tickets; besides, professional murderers would feel somewhat uneasy at the thought that they might have uninvited witnesses of their deeds in the guards passing backwards and forwards. The knowing ones here, who otherwise are not usually frightened by dangerous arrangements, assert that this walking would be too unsafe, and that the English tunnels would not offer sufficient room for it—an assertion which applies to the Underground Railway in London, but not to most other railways in the country. Instead of borrowing from the Continent an arrangement which has been proved to be, if not absolutely the most fit, at all events one that has answered the purpose for many years, they still go here experimenting and disputing. In this way years may roll by, and in the meantime men full of promise may be seriously injured or lose their lives.

It is just the same story with regard to the important question of smoking. Is smoking to be permitted on railways? How shall it be allowed and how shall it be prohibited? In what way can the desires of the smoker be satisfied without inconvenience to the non-smoker? Have the directors really the power to dictate to passengers what kind of smoke, smell, or perfume they shall inhale and exhale? Is the cigar under certain circumstances merely troublesome, or must it also be considered dangerous, as the possible cause of a fire? Is one non-smoking saint to be allowed to interdict smoking to seven heretics shut up with him in the same carriage, or is it to be reasonably expected that he should allow himself to be smoked like a ham? Good heavens! Put a smoking carriage to each train, as has been the custom on the Continent since railways were introduced, and then all difficulties are removed. But no, that is too simple; and up to the present time few English railway companies have copied the Continent in this respect. Amongst them is the South-Eastern, probably because, on account of its geographical position, it is the most accessible to Continental influences.

The arrangements with regard to passengers' luggage are remarkably primitive on very many English railways, if not on all. The luggage is neither registered nor booked; at the very most a label is stuck on it, with the name of the place of destination. Arrived there, each passenger drags out of the heap of trunks, portmanteaus, and boxes, those that he recognises as his own. The railway officials all the time give up all idea of troubling themselves about control, and if mistakes occur—What are your eyes for if you can't recognise your own hatbox? It is a continual miracle that all the trunks in Great Britain have not long ago been stolen—the only explanation of the phenomenon is, that the genius of the English thieves has been greatly overrated.

Again, no arrangements are made to keep out the troublesome dust; and Belgium, which otherwise is somewhat behindhand in railway matters, is almost the only country where I have met with the frames, with fine green wire gauze, which afford capital protection against the dust in summer time, when the windows are open. A want still more felt is that of some means of heating in winter time. Of late years foot-warmers, filled with hot sand or water, are provided, at all events for persons who are known, but they are by no means generally introduced; and although our winters here are mild compared with those of the Continent in the same latitude, still, in the chilly, foggy, early morning one

feels the cold quite as intensely here as there. The French carry out the heating of the carriages in the most thorough manner; and in spite of their *esprit* they are more stiffnecked in many things than many other nations who are blessed with less *esprit*. I look back even now with delight at a great deed which was done many years ago in sight of Boulogne, and I will tell the story for the good of mankind.

It was in the beginning of March. A warm day, quite out of place according to the almanack, had been followed by a sultry night when I got into the train at Boulogne, on my way to Paris. In the same carriage with me were several Normans, whose ancestors did not cross the Channel with the Conqueror, and a downy-faced Englishman, who smelt of Oxford or Cambridge. As becomes respectable travellers, we had just exchanged our innermost thoughts respecting the unusual closeness of the March night, when the door was opened, and one of the well-known metal foot-warmers pushed in between our feet. The first was quickly followed by a second. "Otez cela, s'il vous plaît," said one of the Frenchmen to the officious porter. "On étouffe," remarked another very civilly to him. But all in vain. All our protests, which increased more and more as the troublesome things under our feet became more powerfully felt, were useless against the opposition of all the officials of the Boulogne station, who unanimously declared that until further orders the heating of the carriages was "de rigueur," and that the fatal footstools would have to be regularly delivered up at the next station. "En avant!" The door was banged to, and away we went out into the dark night, with the pleasant prospect of arriving in Paris half stewed. The only one who had not joined in our protest was the tall, downy-faced Englishman. "Nature has given storks a horny covering to the legs," thought I to myself, as excuse for his passiveness. Suddenly he bent down his body to the floor, as if he wanted to snap up a frog with his beak, seized the long foot-warmer with a strong arm, and quietly threw it out of the window over the embankment. The second also followed with a crash. "That'll do," said he, with a polite bow, more to himself than to us. "That'll do," I replied, laughing. The Frenchmen said nothing, but looked with an air of fear at the bold youth who had dared to do such a deed in spite of the authorities. It was only gradually that they recovered their ease. "If they ask us what has become of the foot-warmers we will say they melted from the great heat," remarked one, who, evidently, was very much afraid of a possible inquiry. "Or we can try and get the first word," said a second, "and complain, without being asked, that they gave us no foot-warmers at Boulogne." However, no questions were asked at the following stations, and we arrived at Paris without being stewed. May the memory of the resolute youth be blessed. A great future awaits him. Perhaps already he has got a lucrative sinecure, which—leaving on one side a little immortality—is, after all, the final aim of every active and energetic man.

Fine Arts.

EXHIBITION OF WORKS OF BELLANGÉ.—A collective exhibition of the works of the late Hippolyte Bellangé has been arranged by the committee of the Association of Artists, Sculptors, Architects, Engravers and Designers, and is now open at the Ecole des Beaux Arts in Paris. The collection comprises eighty paintings and one hundred and twenty water colour drawings and sketches, and presents a curious pictorial tableau of the episodes of the wars of France, from the time of the campaigns of the Rhine and the Sambre-et-Meuse, down to Solferino. The two pictures of the battles of Fleurus and Wagram, belonging to the Versailles Gallery, and that of the Old Guard at Waterloo, now the property of the Emperor,

and which attracted so much attention at the Paris *salon* last spring, are included in the exhibition. This collection is highly attractive, not only from the high talent of Bellangé, but also as an illustration of the art of a by-gone period, to which he was so large and popular a contributor.

THE EXHIBITION AT PAU.—It is only very recently that exhibitions of works of art have been attempted in the Pyrenees, yet that now open at Pau includes three hundred and twenty fine pictures, many of them the work of well-known Parisian artists, Accard, Boulangé, Bourgeois, Claude, Dose, Hebert, Jeanron, Thomas, and Zo amongst the number, another illustration of the general dissemination of a taste for art in France.

ART IN ROME.—Ancient works of art are not permitted to be removed from Rome without special permission, and the record of such permissions supplies annually a list of exports. It appears that the whole of the old paintings allowed to be sent away during the past year were valued at less than £1,800, and the ancient sculpture at less than £2,600. The importation of the works of modern artists was very much larger, the paintings being valued at £29,852, and the sculpture at £66,948. The whole exports of the year exceeded those of 1855 by £24,000.

THE NEW MUSEUM OF THE CITY OF PARIS.—The Paris authorities have secured some remarkable works for their new museum, namely, seven sketches by Eugene Delacroix, four appertaining to the ceiling painted by that artist in the Hotel de Ville, and the others to a similar work, one of the chapels of Saint Sulpice. The sketches of this kind by Delacroix are in many cases highly-finished drawings, and probably exhibit more of the true genius of the artist than any other of his works.

Manufactures.

THE CHASSEPOT GUN.—Some trials of the Chassepot gun have lately been made at Versailles by the Chasseurs of the Garde. The following details on this new weapon will be interesting. The Chassepot gun carries 1,000 metres with astonishing precision; it is furnished with a kind of india-rubber stopper, that hermetically closes the chamber of the barrel. The needle is very short. This gun can be fired fifteen times a minute; but in practice it is limited to eight; beyond this number would be dangerous, as regards accuracy of aim, and using up the ammunition too quickly. The gun is very light, weighing only four kilogrammes; the form is elegant, and the stock adapts itself perfectly to the shoulder. The ball is very small; this is an advantage, as a greater number of cartridges may be carried. At the end of the barrel a sword bayonet is fixed. The Chassepot gun is superior to the celebrated Prussian needle gun, which only carries 400 metres; the needle, also, of the Prussian gun is too long and easily broken. The soldiers of the Chasseurs-à-pied, being now accustomed to the gun, have obtained wonderful results with it, especially at 1,000 metres range; at this distance the bull's-eye has been hit no less than thirty times out of a hundred.

Commerce.

PRODUCTS OF CALIFORNIA.—A lake of borax has lately been discovered in California, which will probably produce a complete revolution in the commerce of this chemical substance. The Californians likewise are turning their attention to agricultural pursuits, and begin to cultivate the olive. They state that their olive oil will soon rival the finest Italian oil.

REPORTED ADULTERATION OF GERMAN SUGAR.—In a letter addressed to a *Lisla* journal, by M. B. Corenwinder, a manufacturing chemist, of Habourdin, Nord, France, the writer says:—"A French merchant forwarded me,

a few days ago, a sample of some sugar received from Magdeburg, and wished me to analyse it. The peculiar taste of the sugar, which in appearance was equal to No. 12, excited my curiosity, and led me to fulfil the wish of my correspondent. I find that it contains an unusually large proportion of saline matters, the result of the analysis being as follows:—Water, 5 per cent.; sugar, 75 per cent.; the rest (20 per cent.) was composed of saline substances, the greater part of which was made up of chloride of potassium. It occurred at once to me that the large proportion of saline matter could not have possibly existed in the beet, and that it must have been added to the sugar after manufacture, with a fraudulent intention. Perhaps you are not aware that in the environs of Magdeburg, at Strassfurt, there exists a mine rich in chloride of potassium, and that this salt, which is admitted duty-free into France, undersells the potash extracted from our own beet. Refined chloride of potassium now fetches at Magdeburg 17frs. the 100 kilogrammes, but can be had at a much lower price if unpurified. This coincidence leads me to suppose that the salts added to the sugar are procured from the mine at Strassfurt. The fraud is owing to an evasion of the German laws regulating the sugar duties, for the duty in the Zollverein is charged upon the raw beetroot, and the German merchant, when exporting sugar, has a right to a drawback calculated on a yield of 8·70 per cent., and amounting to 21frs. 50c. the 100 kilogrammes. I will not now consider whether this drawback is equivalent to the rate of duty charged on the beetroot, or whether it is actually a disguised bounty to exporters, but merely wish to point out the large profit the German maker would enjoy if he could make us accept sugar like that which I have just analysed. It is evident that if, on the exportation of 100 kilogrammes of sugar, a drawback of 21frs. 50c. is given to the merchant, 20 kilogrammes of the saline matter, when mixed with the sugar, would obtain a drawback of 4frs. 30c., from which the higher cost of the raw material has alone to be deducted." In commenting upon this, the *Produce Markets Review* says:—"M. Corenwinder appears to think, at the conclusion of his letter, that it is at any rate partially owing to adulteration that the German makers have been able to undersell the French in their own markets. The editor of *Le Propagateur* remarks, in a foot-note, that the fraud M. Corenwinder points out is not an isolated case, and that persons engaged in the German trade know that the sugars often contain a more or less considerable proportion of saline matters. All we can say is that we have heard of no such instance in England, and that the fraud would be so easily detected by the taste, that to engage in it would not only be dishonest, but foolishly so. There are black sheeps in all communities, and the honourable body of German sugar manufacturers owe it to themselves to discover and put an end to the nefarious practices complained of in France, if they have any existence in reality. For ourselves we are inclined to think that the mixture of salt complained of must have been accidental, or it would have been discovered in England, where a considerable trade has been done in German sugars."

THE CO-OPERATIVE SYSTEM IN SWITZERLAND.—The high price of the common necessities of life in Switzerland has given rise to the establishment of many co-operative societies, for the supply of articles of food and other ordinary matters, and the principle is being gradually applied in other ways. Besides the societies already alluded to, there are co-operations for the supply of work-room, light, and heat, on moderate terms; societies for the fabrication of various articles by associated artisans; and lastly, credit and loan societies. The first named class is, however, the only one which has been carried out to any great extent; the others are but just rising into popularity. Those societies which confine themselves to the supply of their own members only with the necessities of life, have not produced any noticeable result, while those which supply the public in

general, and serve as savings' banks for the associated members, have produced a marked effect on the retail trades, and they grow rapidly in importance by the reinvestment of dividends. The one grand difficulty at the threshold, which is at the same time one of the greatest benefits, is the necessity of enforcing all payments in cash. The society of Lausanne is of the former limited kind; its total business in 1864 only amounted to about £7,000, and its profits to less than £350; and in 1865 they were both considerably less in amount. On the other hand the society of Zurich, which is on the broader basis, does business to the extent of about £43,000 a year, and makes a clear profit of about two per cent. The Zurich society is the most important of its class, the next being those of Vevey and Neuchâtel; but there are many others, and their number increases daily. The credit societies progress rapidly, and promise to be of great importance to the labouring population. They are founded on the German principle, and the associated bank of Zurich has a capital in shares of a million of francs (£40,000). The Union Vaudoise of Lausanne, founded on the plan of the Belgian banks of credit, was received with great favour; it commenced in 1864 with a capital of £16,000, which had grown last year to £72,864, the number of members being 519. The savings' bank department had 328 depositors. The total amount of business done during the year was about six millions of francs, and the profit ten thousand. Each member of the association takes shares to the amount of the credit granted to him, and this latter is fixed by the admission committee, consisting of nine members, three of whom retire every three months, and are not immediately re-eligible. The general council appoints the director and all the other paid officials; the general meeting is held every six months, when dividends and calls are decided upon. The effect of these societies on the condition and habits of the Swiss working classes is expected to be very important.

THE NORWEGIAN HERRING FISHERY.—Although the herring fishery is not the most important that is carried on off the coast of Norway as regards the capital that is required, it is, however, one which is carried on along the greatest extent of coast, and which employs the greatest number of hands. This fishery is divided into three distinct branches—that of the winter or spring herring, the summer herring, and the sprat fishery. It is difficult to know what becomes of the herring during the time that it disappears from the coasts, and the causes of the inexplicable changes that take place in the time and places of its re-appearance. One thing is certain, that this fish sometimes suddenly quits the waters that it is in the habit of frequenting, and returns again in the same sudden manner. This took place, for instance, on the coast of Sweden in the year 1808, when the herring suddenly disappeared, and since then has never re-appeared in any quantity; and by a remarkable coincidence great herring fisheries were commenced on the coast of Norway the same year. The herring fishery has from the most remote times been mentioned as one of the principal sources of existence and prosperity of the Scandinavian peninsula. In the ninth century history records abundant fisheries, and towards the year 1416 it mentions the use of salt for the purpose of curing the herring. In the sixteenth century upwards of 100,000 tons of herrings were exported from Marstrand, near Gothenburg; in 1567 the fish completely disappeared, and it was not until about the year 1700 that manila was made of them again. At the present time the herring is principally found off the coast of Norway, between Stadland and Lindesnes. The most important fisheries are carried on south of Bergen, round the island of Karmoe, the small isles Fæø and Røvær, and along the coast of the main land, from Hangesund to Sletten. The fishing population of the Norwegian coast are superstitious, and believe that the result of the fishery may be foretold by means of certain signs or omens.

Thus the appearance of whales in the autumn is a sign of an abundant fishery in the following spring. A still more certain indication is the appearance of a small fish. Finally, the appearance of the herring is announced by the quantity of seagulls that follow them eagerly, and feed on them. The best season for fishing begins in the month of January, and continues to about the end of March. Last year the herrings appeared in great quantities on the southern coast of the island of Karmoe, and at Kinn, in the northern district, and the fish in these two places are very plentiful. Altogether the results have been far superior to those of former years, and may be estimated at 750,000 barrels, of which 600,000 have been salted for exportation, the remainder represents the home consumption. The average price per barrel on the spot has been from 10 to 11 marks (about ten shillings). Some months later the fish was sold in the ports on the Baltic at from 20s. to 23s. per barrel. About 7,040 fishing boats, manned by 35,000 fishermen, took part last year in the herring fishery, and about 15,000 men may be estimated as employed on shore for curing, salting, &c. This fishery is encouraged, and a sum of money has recently been voted for the construction of lighthouses; the telegraphic lines on the coast have been greatly extended, and the fishermen have taken advantage of this means to know of the arrival of the fish. Notice is posted up daily at the various telegraph stations by the inspectors concerning the appearance of the shoals of fish, and it is a strange sight to witness the departure of thousands of fishermen, buyers, sellers, &c., with their boats, barrels, and various utensils, hastening to some distant place named by the telegraph. The fishermen seem to appreciate this means of communication; and when the result of the fishery is principally due to it, they give the name of "telegraph herrings" to the fish. Every morning, at each station, notices are posted up by the inspectors as to the quantity of fish caught and the price paid per barrel. Two kinds of nets are chiefly used for catching herrings—the drift nets, of which from twenty to five and twenty are carried by each boat, with four or five men; the stop net, which has been used in Norway since 1820. This latter fishery is carried on with three nets, which each require a separate boat. It is much more uncertain than the other, and requires a much larger stock, but sometimes it gives much greater results. Amongst the principal export markets for the herring, Sweden and Russia stand first, then Prussia and the Baltic ports. The consumption of England varies from year to year, and principally depends on the result of the fishery on the coast of Scotland.

CITRIC ACID is made from the juice of fruits of the citron tribe, principally from the *Citrus acidus* (the lime of the tropics), the *Citrus limonium*, or lemon, and the *Citrus bergamia*, or bergamot lemon, the former containing the most citric acid, and the latter the least. The juice used in the manufacture is imported from Sicily in a highly concentrated state, its market value varying greatly, viz., from £15 to £30 per pipe. The average annual imports from Sicily have been 200,000 gallons. After the rind has been used for the separation of its essential oil, the juice is expressed from the fruit and evaporated to about one-sixth of its original bulk, previous to shipment. In the shipment of limejuice from the West Indies, the concentration is carried still further, the juice of five tons of fruit being reduced to the dimensions of a fifty gallon cask. The acid is separated from the impurities with which it is associated in the juice by Scheele's process of combination with lime, and subsequent decomposition by sulphuric acid. The commercial product consists of pure white transparent crystals, very soluble in water, and of an agreeable acid taste, and the amount annually manufactured approaches 800 tons. From the varying yield of the lemon crop of Sicily the price of citric acid is subject to corresponding fluctuations, and has ranged during the last seven years from £150 to £300 per ton. The chief commercial uses of this

substance are in the manufacture of cooling drinks, in dyeing, and calico printing.

Colonies.

POPULATION OF VICTORIA.—The estimated population of Victoria, on the 30th September, 1866, was 638,988 persons—being 363,304 males and 275,784 females. The gain to the colony by excess of immigration over emigration was, during the previous quarter ending on the above date, 1,729—viz., 796 males and 933 females. In the former quarter the net gain by the same means was, 1,215, viz., 851 males and 364 females.

CUSTOMS DUTIES IN VICTORIA.—An agitation has been going on in the northern districts of Victoria with a view to the abolition of the border customs. Meetings were held, and strongly-worded resolutions adopted, the residents on both sides of the river protesting against the injustice done to them. The points on which the most stress was laid are, that the system now in operation, by preventing the free traffic of inter-colonial produce, is a heavy tax on the people of the districts, impeding trade in general, and is regarded by all classes of the community as an insufferable and unnecessary burden, and that, as the Victorian Government is willing to accede to any fair proposal for compensation to relieve the inhabitants of the border districts from this oppressive taxation, the New South Wales Government ought at once to come to some different arrangement.

LOBSTERS.—Fine lobsters are said to have been found in the waters of the Murrumbidgee. In flavour they are said to be fully equal, if not superior, to the marine species.

DISTRESS IN NEW SOUTH WALES.—A Sydney paper states that there were recently some 3,000 men in Sydney who were unable to obtain employment; and that the number of persons in indigent circumstances was not less than 7,000.

TRADE OF MELBOURNE.—The following is a statement of the imports and exports at the port of Melbourne up to November 17, 1866, compared with the same period of the former year:—

Years.	Imports.	Exports.
1866	\$12,233,454	\$9,711,677
1865	11,008,004	9,432,067

showing an increase of \$123,045 in the imports, and of \$289,610 in the exports.

VICTORIAN RAILWAYS.—The following statement shows the total revenue for passengers, goods, and cattle traffic on the Victorian Government railways for the month of October:—

Lines.	Passengers, Parcels, &c.	Goods.	Total.
	£ s. d.	£ s. d.	£ s. d.
Murray River	9,459 10 6	23,440 13 8	32,900 4 2
Williamstown	1,154 8 11	2,123 12 8	3,278 1 7
Ballarat	8,691 19 4	10,284 14 5	18,976 13 9

ROOT CROPS IN VICTORIA.—The cultivation of man-gold has hitherto been attended with great success in the colony of Victoria, and is rapidly extending. Like the cultivation of grass, the growth of mangolds is evidence of the change for the better which agriculture is undergoing in that colony—becoming more systematic and varied, and combining the feeding of stock with the growth of cereals. An agricultural distillery, recently erected by an enterprising firm, has given an impetus to the production of beet and mangolds. They manufacture spirits from the roots, leaving the pulp, when deprived of its juice, as an excellent food for cattle.

PRODUCTS OF WEST AUSTRALIA.—There is said to be an almost inexhaustible quantity of iron ore, of good quality, a profusion of copper and lead, and coal in abundance, all of good quality. Silver, antimony, &c., are also known to exist, but for want of capital little has hitherto been done. Some of the timber is of great value. The jarrah, or native mahogany, is peculiar to West Australia. If cut at the proper season, when the sap is down, it is believed to be one of the most enduring of all woods. It is much used in India and the colonies for railway sleepers, telegraph posts, dock gates, &c. Vessels have been entirely constructed of this wood, which appear not to have required copper sheathing. It is also valuable for ornamental purposes.

NEW ZEALAND COAL.—From Dr. Hector's report as to the coal deposits of New Zealand, it appears that a seams have yet been discovered that can be referred to a palaeozoic coal measures, such as occur in the northern hemisphere; all the formations which contain workable seams appear to belong to the secondary and tertiary epochs, but the quality of some of the coal is excellent. The coals of this colony have been divided into two parts, the hydrous and the anhydrous, the former having a large percentage of water in combination with them, and the latter, which is of a better kind, being comparatively dry. The hydrous coal is largely distributed throughout the islands, and, although it has its defects, it is a valuable fuel. In one field a bed extends over 45 square miles, and is already being worked; the total quantity of coal is estimated to be 100 millions of tons. The anhydrous coals of New Zealand resemble those of England and Australia, but are not quite so tough as solid as they should be for steam coal.

NORTH AUSTRALIA.—The liberal terms offered by the Government of Western Australia, and the inducements held out by the Government of Queensland, appear to be doing much for the settlement of North Australia. They are causing *bond fide* settlements to be established to the west and to the east, and the pastoral lands between the Victoria and the De Gray rivers are being occupied by squatters, who, if they fail in one part of the country, perseveringly push on to another. Whilst the colony of South Australia has been sending ship after ship round to Adams' Bay, without any important result, the Queensland squatters have been gradually grazing their way to the Gulf of Carpentaria, and establishing stations, towns, and depôts all along the coast.

Publications Issued.

A DICTIONARY OF PHOTOGRAPHY. Edited by Thomas Sutton, B.A., and George Dawson, M.A. (Sampson Low and Co.)—The first edition of the "Dictionary of Photography," published in 1858, has been out of print several years. In consequence of this, and the continuous demand for the work, the publishers have entrusted the present editors with its entire supervision, in the belief that a new edition would be a desirable boon to photographers, by supplying them with a book of easy reference, in an alphabetical form, whereby they will be saved the trouble of wading through elaborate and often badly-arranged treatises to find information on the subject to which they wish to refer. It has been the desire of the editors to condense rather than to expand the matter contained in this volume, and to make it as thoroughly practical as possible. With this object in view, they have eliminated the debatable theories and speculative articles, which occupied a prominent position, especially in the first part of the previous edition, and they have abridged other articles which, at the present time, are of less importance to photographers than they were in the year 1858. In lieu thereof a great deal of practical matter has been added, including

all the new useful processes; many of the original articles have been re-written, in a spirit more consistent with the present advanced state of the art; the preparation and properties of the necessary chemicals, and the theory and construction of the different optical instruments required have been succinctly described; but a detailed account of the different kinds of cameras, printing-frames, stands, and some other photographic items has not been given, because a complete description of what can be seen at any photographic warehouse would be entirely out of place in a work of this kind, and would have occupied too much space. The aim of the editors has been to make this work a photographic *multum in parvo*. The work is illustrated with numerous diagrams; it contains 390 pages.

Notes.

POPULATION OF THE PRINCIPAL TOWNS OF FRANCE.—The following is the population of ten of the principal towns of France:—Paris, 1,825,484, the population of which has doubled since 1841; Lyons, 323,954; Marseilles, 200,131; Bordeaux, 194,241; Lille, 154,779; Toulouse, 126,936; Nantes, 111,956; Rouen, 100,671; Saint-Etienne, 96,620; Strasbourg, 84,167.

POPULAR EDUCATION IN FRANCE.—The municipal council of Clermont-Ferrand has taken a step which will probably have a great influence on the question of popular education. It has, by a recent vote, thrown all the communal schools of the town open without question or qualification. There is a considerable party in France in favour of the American system of gratuitous primary education, and the vote of the council of Clermont-Ferrand is an important step in that direction.

THE UNITED STATES AND THE PARIS EXHIBITION.—A correspondent of the *Times*, writing from Philadelphia, says:—On January 17 the ship *Mercury* cleared from New York, for Havre, with a cargo of goods for the Paris Exposition. This is the second cargo sent from the United States, and it embraces goods from every part of the country, among them being an American street-railway car, an Illinois school-house built in sections, California gold and silver ores, a Western farm-house in sections, Indiana Indian corn-stalks, 17ft. high, a Philadelphia machine for planing and working iron, weighing 40 tons, a Vermont stone-cutting machine, used in quarries in lieu of blasting, Connecticut breech-loading rifles, a Massachusetts steam bakery, which makes bread without the use of any man power, a vast number of agricultural implements, artificial arms, legs, teeth, and eyes, an American army waggon which was in Sherman's famous "march to the sea," a glass plough—not a model, but a working plough—and two 16-inch cannon. Another vessel will probably be chartered to convey American contributions, and from Toronto it is announced that there will be about 400 Canadian contributors to the exposition.

POST-OFFICE AT THE PARIS EXHIBITION.—"The directors of the Paris Post-office," says the *Journal des Postes*, "are taking final measures to meet the considerable requirements occasioned by the influx of strangers during the exhibition. In a pavilion situated in the Champ de Mars, near the central monument, part of which is devoted to the telegraph business, a post-office is being installed to comprise all the branches of the Post. The clerks on duty are chosen from amongst those who speak several languages. The office will be opened on March 1 at latest, in the interest of exhibitors who are arrived beforehand to superintend their instal-

Canada Great Western Railway has just completed a route of uniform gauge between this city (Chicago) and New York and Boston. The inaugural train introduced us to some luxurious novelties of travel. Among them was an hotel car with a little kitchen. At each seat tables can at once be put up, and on the passenger touching a bell-cord a servant promptly responds with a bill of fare, from which the traveller selects such edibles as best suit him, and is presently enjoying all the comforts of an admirably-cooked and served meal, while going at the rate of forty miles an hour. Two palace-sleeping cars, the "Mayflower" and the "City of Detroit," also went through without change. Each contains six sofa and twenty-six seats. The finest Wilton carpeting covers the floor; the wood-work is all black walnut, carved and inlaid with gilt; windows and ceiling are ornamented in the Moorish style; mirrors hang opposite each seat; tables for eating, writing, and playing are ready at hand; curtains made to order and imported cover the windows, and the room in the daytime resembles an elegant parlour. But, when night comes on, a few moments change the scene, and luxurious beds for sixty-four people appear, with costly hair mattresses and pillows, and clean—absolutely clean—sheets and coverings. In the morning each passenger is handed his separate towel, hot and cold water are ready in convenient washrooms at each end, and he finds himself refreshed and comfortable hundreds of miles from where he retired to rest in this flying hotel. An even and gentle heat is diffused from one of Westlake's heaters beneath the floor, and pure ventilation is effected by openings below, through which the air is brought in pipes from the roof, and diffused through the car, escaping at the ceiling when found to be impure. All the metal work inside is plated with silver, and a bright light is diffused at night from great lamps pendant from the ceiling. The cars run on two trucks of eight wheels each, and the motion is so smooth that a person can easily write while going at full speed. These cars are among the wonders of this rapid age.

Correspondence.

IRON PERMANENT WAY.—SIR,—In your publication of the 1st inst. I recognise in Mr. Bridges Adams a fellow-labourer in the good cause of promoting the use of longitudinal iron permanent way, and I have no doubt that if his early system had enjoyed a fair trial, the principle would have reached a degree of completion possibly in advance of the system now in use in Germany, and certainly ought to have prevented the adoption of wooden sleepers in India and other tropical climates. I believe, however, that the plan of placing the horizontal angle-arm below is preferable, inasmuch as it permits more careful packing of ballast under and between the rails, and facilitates the removal of the head-rail, which in my systems six and seven (see *Journal*, p. 146) can be adjusted or renewed without disturbing the integrity of the under-way, which remains essentially permanent, as long as we do not incorporate perishable wood or destructive cast-iron. Mr. Adams is quite right in advancing that elasticity of wheels should have deserved more attention than in practice it has hitherto got in this country. His spring-lined tyres are admirably efficient on engine-wheels; on carriages and trucks we have supplied elasticity by means of the corrugated wrought-iron disc wheel, which is in general use on German railways, and may probably work its way here when statistics of maintenance of rolling stock are made up and studied. But I agree with Mr. Adams that it requires perseverance (if worth one's while) to direct railway authorities, or advisers, in the way of economy.—I am, &c., T. A. ROCHUSSEN.

Journal of the Society of Arts.

FRIDAY, FEBRUARY 15, 1867.

Announcements by the Council.

ORDINARY MEETINGS.

Wednesday Evenings at Eight o'Clock:—

FEBRUARY 20.—“On the Water Supply of London as it affects the Interests of the Consumers.” By THOMAS BEGS, Esq.

FEBRUARY 27.—“On the Economy of Telegraphy as part of a Public System of Postal Communication.” By EDWIN CHADWICK, Esq., C.B.

MARCH 6.—The following subject for Discussion will be introduced by Mr. CHRISTOPHER COOKE:—“On Storm Signals and Forecasts, their utility and public importance with respect to Navigation and Commerce.”

CANTOR LECTURES.

A course of Six Lectures “On Pottery and Porcelain,” illustrated by specimens of various manufactures, and by photographs and diagrams, is now being delivered by William Chaffers, Esq.

LECTURE V.—MONDAY, FEBRUARY 18.

EUROPEAN PORCELAIN.—Italy, Germany, France, Holland, Belgium, Russia, Poland, &c.

LECTURE VI.—MONDAY, FEBRUARY 25.

ENGLISH POTTERY AND PORCELAIN.—Early History, continued to the beginning of the 19th century.

The lectures commence each evening at eight o'clock, and are open to members, each of whom has the privilege of introducing one friend to each lecture. Tickets for this purpose have been issued to each member.

ART-WORKMANSHIP COMPETITION.

The Department of Science and Art has purchased, for the South Kensington Museum, the following articles, for which prizes had been awarded in the recent Art-workmanship competition:—

5. Flowers carved in Caen Stone, by W. H. Holmes, 101, Dean-street, Soho, W. Price £5.—(Prize of £5.)

15. REPOUSÉ WORK IN METAL.—Executed in iron, after the Martelli bronze mirror case at South Kensington, by G. Page, 39, Duglas-street, Northampton-road, Clerkenwell, E.C. Price £20.—(1st Prize of £10; also, North London Exhibition Prize.*)

28. HAMMERED WORK IN IRON.—By George Hobbs, 4, Marlboro'-mews, Blenheim-street, W. Price £5 10s. (Prize of £2.)

30. Ditto, Panel for a screen, by W. Letheron, Lansdown Iron Works, Cheltenham. Price £20.—(Prize of £10.)

41. “Autumn,” Female Head in satin wood, by G. F. Bridge, 3, Vincent-square, S.W. Price £5 10s.—(Prize of £5.)

* This Prize consists of the interest of £167 7s. 3d. Consols, invested in the name of the Society of Arts, to be awarded by the Council “for the best specimen of skilled workmanship” at the Society's Exhibition.

The works sent in competition for these Prizes are now placed in the Society's Great Room for the inspection of members and their friends.

EXAMINATIONS, 1867.

In addition to the prizes announced in the Programme of Examinations, the following are offered:—

The Worshipful Company of Coach and Coach Harness Makers offer a prize of £3 in Freehand Drawing, and a prize of £2 in Practical Mechanics, to the candidates who, being employed in the coachmaking trade, obtain the highest number of marks, with a certificate, in those subjects respectively.

The Worshipful Company of Goldsmiths offer three prizes—of £5, £3, and £2 respectively—to the three candidates who, being employed on works in the precious metals in any part of the United Kingdom, shall obtain from the examiners the first, second, and next highest number of marks, such prizes to be distinguished as the “Goldsmiths' Company's Prizes.”

INSTITUTIONS.

The following Institutions have been received into Union since the last announcement:—

Alderley Edge Educational Institute.

Galgate (Lancaster) Mechanics' Institution.

MEMORIALS OF EMINENT MEN.

The Society's Committee for marking by memorial tablets the spots which are interesting as connected with eminent men or historical events, have made a commencement of this work. A tablet, marking the house where Byron was born, has been attached to No. 24, Holles-street, Cavendish-square, by permission of the occupiers, Messrs. Boosey and Co.

SUBSCRIPTIONS.

The Christmas subscriptions are due, and should be forwarded by cheque or Post-office order, crossed “Coutts and Co.,” and made payable to Mr. Samuel Thomas Davenport, Financial Officer.

Proceedings of the Society.

FOOD COMMITTEE.

A meeting of this committee took place on Saturday, the 9th instant, at eleven o'clock; the Right Hon. Henry Austin Bruce, M.P., in the chair. There were also present—Professor Robert Bentley; Messrs. W. H. Bodkin, Assistant-Judge; Harry Chester; Hugh C. E. Childers, M.P.; Rev. W. L. Clay; Lord De Lisle and Dudley; Messrs. William Hawes, C. Wren Hoskyns, Francis S. Powell, M.P.; Clare

Sewell Read, M.P.; G. Sclater-Booth, M.P.; Benjamin Shaw, Thomas Twining, James T. Ware, and Edward Wilson.

The Secretary having read the minutes of the last meeting,

The CHAIRMAN said that the able and comprehensive address which was made to them at their last meeting, by Mr. Chester, would enable him to dispense with the necessity of addressing them again upon the subjects then dealt with. He thought he might assume that they were familiar with the objects for which the committee had been formed. He would therefore address himself at once to the practical points—how and by what means they could best organise themselves so as to attain most rapidly and effectively the objects for which they were constituted? These objects, broadly stated, were the supply of additional food to the people, and the better use of those supplies which they already possessed. The former subject embraced the supply of meat and of cereals from abroad, but more especially of meat—and when he said meat, he did not mean live cattle, because he thought they might very well trust to the interests now occupied with that trade. It was one which had increased rapidly—one which recent circumstances had tended greatly to augment; and as communications on the Continent by railway increased, and greater facilities for transit were afforded, there could be no question that, to some considerable extent, there would be an increase in the supply of cattle. But there was another question, which could not be left entirely to the management of traders, and that was those operations into which science so largely entered—namely, the supply of preserved meat, and of the essence of meat—a question which had already occupied the public attention, but as to which, he thought, no very great progress had hitherto been made. Now, it seemed to him, that they might most usefully form a sub-committee, specially to address itself to that subject—the supply of preserved meat and of the essence of meat from foreign countries. It might be, perhaps, as well to entrust the same sub-committee with the question, also, of considering what supply of cereals and other edibles could be got as well as meat; but in the first instance he would rather suggest that that sub-committee be requested to apply itself particularly to the branch of the subject he had just indicated. Then came the question as regarded home supplies. In his opinion, by far the most important parts of this question were those specially indicated by Mr. Chester, the supply of milk and fish, and the spread of juster ideas of cookery than now prevailed among our working classes. As to the supply of milk, it was notorious that it was inadequate, not only in the metropolis, but everywhere, even in the most strictly rural districts. The importance of that supply to the health of our population could not be exaggerated, and therefore he thought that by itself might occupy the attention of another sub-committee. Another question, of much inferior importance, but one of deeply national and growing interest, was the supply of fish. Recent disclosures had shown that here was a field open to considerable improvement; and he did not doubt that if the attention of a few intelligent, determined men were applied to that subject, there might be a very great advance made in that respect. Perhaps the largest and most difficult question of all to deal with was that of what might be called national dietetics—the actual food used by the people, and their mode of cooking it. There were few of them who had not had opportunities of inquiring into this matter. He might say, in passing, with respect to certain classes of the population, that he (the Chairman) had some opportunities of studying this subject during the two years he served upon the Mining Commission, when that was made a part of the inquiry. The ignorance which prevailed as to the proper use of food among the working classes of this country was

very great. Probably in this matter they were among the most backward in Europe, certainly they were the most wasteful; and, great as the evil was, it seemed to him that greater still was the difficulty of dealing with it, because we had to do with the settled habits, and often with the fixed prejudices of the people. But the difficulty of a question was no reason why they should not attempt to grapple with it, and he hoped they would be determined to exert themselves by every means to extend knowledge in this direction, and to remove that ignorance which all allowed to be a great evil. He had already indicated sufficient employment for four sub-committees, and he did not think that at present it would be well to appoint a larger number. There was another point, however, which he thought well worthy the attention of this Committee, and that was what steps should be taken with respect to the remedying of a crying evil, namely, the frauds that were committed, both as to the weight and quality of the goods sold, especially against the poor. It seemed to him that that was a subject ripe for legislation. The Committee had already communicated with the Home Office to ask for certain returns which would throw light on this subject—returns as to the number of prosecutions that had been instituted under the law, which, with respect to false weights, was certainly inadequate. The offence was, perhaps, sufficiently clearly defined, but the punishment was altogether insufficient, and he saw no reason why the present Session should pass without a Bill being introduced into Parliament for remedying that evil. It might, therefore, be advantageous to combine a few lay gentlemen and members of Parliament into a sub-committee, for the special purpose of considering that subject. These matters were far from exhausting the whole question, which indeed was almost boundless, but he thought that they should limit themselves, in the first instance at least, to the most important branches of the inquiry, particularly those indicated by Mr. Chester in his opening address. What they had to do that morning was to divide the Committee into sub-committees, choosing the members with reference to their special fitness for investigating the different subjects of inquiry. He would, therefore, propose at once to the consideration of the Committee that they should take their first step by determining what the number of sub-committees should be, and then by dividing themselves into those sub-committees. A very comprehensive circular had been prepared, which it was proposed to send to any person supposed to possess special knowledge on any of these questions. If any suggestion could be made for its improvement, he should be very happy to hear it.

Mr. C. S. READ, M.P., said that, with respect to the transit of dead meat, very much good might be done by a simple inquiry into the matter. It was generally supposed that the offal of meat killed in the country could not be sent up to town. The idea might arise, perhaps, from the prejudice or the interests of certain people in the trade. If attention were directed to this matter by the Committee some valuable information might be obtained.

Mr. CHANDOS WREN HOSKYNs said, with reference to the supply of milk, it was mentioned in the address of the President of the Royal Agricultural Society, at the beginning of the year, that the quantity of milk sent up to the metropolis from different parts of the country amounted to something like seven million gallons annually. It was also stated that this milk came from distances varying from between seven miles and two hundred miles,—that there were parts of the country, two hundred miles off, where the occupiers found it their interest to send up milk to the metropolis, but there were other parts, less than fifty miles distant, where attention had never been directed to the supply, and by the mere publication of good might be done.

The CH

He agreed with Mr. Read,

that all the information that reached them last year in Parliament showed that one of the objections to killing at a distance was that a great deal of the offal of the meat, which would be bought by the poorest of the people, did not reach the metropolis, and did not find a market in the place where the cattle were slaughtered. That seemed to be a subject that might very well be considered. Another matter for consideration was whether a larger area might not be obtained from which to draw a supply of milk for the metropolis. It must be remembered, however, that they were not dealing with the interests of the metropolis alone, but with the supplies of the whole of the population. The Council should first get accurate information, and then propagate it, so as to make the farmers understand that they were not only backward in the question of the supply of education to their workmen, but also in the supply of that which was so necessary to the health of their children—milk.

Mr. EDWARD WILSON said, looking over the programme, which had been very carefully drawn up by the sub-committee, he began to feel rather appalled at the wideness of the scope of the inquiry. Probably the best mode of dealing with the matter would be through the agency of sub-committees; but viewing the committee as it at present existed, it seemed to him that if they did not materially increase the number of members they would not be able to appoint many sub-committees. With regard to another question—the establishment of cheap dining-rooms—the success of Mr. Corbet at Glasgow was well known, and was an illustration of what could be done by singleness of purpose and energy. He (Mr. Wilson) would be very glad to join any set of gentlemen, to whom the question of profit was not an object, to see if something practical could not be done in London in this direction.

Mr. SOLATER-BOTH, M.P., said that, with regard to the subject of fraudulent weights and measures, he believed that in the course of a few weeks a bill would be prepared and introduced, strengthening the law in respect to adulterations and frauds. A small sub-committee on this subject might, therefore, be useful. With regard to the milk question, he might say that the subject of the disposal of the sewage was very appropriate to that investigation, and should not be lost sight of in considering it.

Professor BENTLEY thought that four sub-committees would be too many. He would propose that the first three subjects, which were the most important, should be grouped together under one sub-committee, who would thus deal with the animal kingdom. The fourth and fifth would occupy a second sub-committee, who would deal with the vegetable kingdom, and also with the subject of beverages. Then the sixth and seventh subjects—dietaries, &c.—would naturally come under a third sub-committee. As to the last subject—adulteration—he thought it would be utterly impossible to do anything with a bill on that question this session; and his impression was that it would come far better at the end of the inquiry, when a vast amount of valuable information had been collected by the sub-committees.

The CHAIRMAN thought the subject of meat should be separated from those of milk and fish. He agreed that the question of adulteration was a very large one, and would require a great amount of preparation, but the subject of fraud was very pressing, and influenced enormously the daily comforts of the people, and he thought this might be dealt with very rapidly.

Mr. CHESTER thought the subject of adulteration a most important one, and hoped the Committee would be able to do something to stay the increasing tide of fraud in the commercial transactions connected with the supply of food. He thought when they had collected a sufficient amount of information to enable them to proceed, as to the police regulations of foreign countries as well as our own, they might, perhaps, have a paper read by a gentleman now present, and thus they might have some very

advantageous denunciations of the evils which existed put forth from this Society. There might be also a bill brought into Parliament. There were several members of the House of Commons present, who, he had no doubt, would take an active part in the matter. It would not be a party question, and thus, he thought, if properly prepared, it would pass without difficulty.

Mr. SHAW thought the number of sub-committees should not be too large, or there would be a difficulty in working them. He was rather for not pressing the matter with regard to adulteration at first. If they could get working committees on meat, and on milk and fish, he thought they would really do a great deal. As regarded the improvement of cookery, that seemed to him a subsequent question; it would be better to have the facts brought out by the other committees first as to the supply of food. With reference to the question of the supply of meat, they must recollect that they had now in this country, for a short time, Mr. Parish, the Consul at Buenos Ayres, and if they could get matters forward while he was here, they would be able to tell him fully what they required, and then he would go back to his consulship, and do much good in promoting the supply.

Mr. F. S. POWELL, M.P., suggested that as to the question of fish, some of the members of the Commission lately sitting in Paris might be able to give them some very valuable information. He had received a letter from the Professor of Chemistry at Cambridge, which touched upon a question it might be worth while for the Committee to look into—namely, the quantity of fish which was rejected by fishermen as not being valuable.

Mr. SHAW moved—"That one sub-committee be appointed to inquire into the question of meat, and another to inquire into those of milk and fish." This, after some discussion, was carried, the sub-committees being constituted as follows:—

MEAT.—Right Hon. H. Austin Bruce, M.P., Messrs. H. Chester, H. C. E. Childers, M.P., C. Wren Hoskyns, W. H. Michael, F. Parish, C. Sewell Read, M.P., Benjamin Shaw, T. Twining, James T. Ware, and E. Wilson.

MILK AND FISH.—Lord De L'Isle and Dudley, Lord Robert Montagu, M.P., Right Hon. H. Austin Bruce, M.P., Messrs. H. Chester, and C. Sewell Read, M.P.; in addition to whom Messrs. James Caird, P. McLagan, M.P., H. S. Thompson, and J. C. Morton were to be asked to join.

The Sub-Committee on Meat met at 10.30 on Wednesday. Present—The Right Hon. H. A. Bruce, M.P., in the chair; Messrs. C. S. Read, M.P., E. Wilson, F. Parish, B. Shaw, H. Chester, and J. T. Ware. The Committee, after discussing the course which their proceedings should take, directed the Secretary to bring before them at their next meeting specimens of the various methods of meat preservation.

CANTOR LECTURES.

"ON POTTERY AND PORCELAIN." BY W. CHAFFERS, Esq.

LECTURE IV.—MONDAY, FEB. 12.

German Pottery and Oriental Porcelain.

The lecture commenced with a description of the two sorts of earthenware made in Germany—fayence and grès, or stoneware, and their properties were defined. In speaking of Nuremberg, the lecturer said the most celebrated potter was Veit Hirschvogel, of Schelestadt, born in 1441, and died in 1552 (contemporary with Luca della Robbia, of Florence), who settled here about 1470. These early specimens are somewhat like the maiolica of Italy, but the colours are brighter—the

green predominating in most of the specimens; figures in relief in niches are frequently seen on vases; and many tiles of the sixteenth century, which formed portions of stoves and chimney-pieces, are still in existence, and were referred to. The stoneware of Germany is well known throughout Europe; its durability for domestic purposes, and the elegant character of its ornamentation in relief, caused it to be sought for everywhere. The grès de Cologne was especially esteemed, and is often confounded with the grès de Flanders, which latter name is given indiscriminately to all the stoneware of Germany, notwithstanding the German inscriptions upon the vessels, and the arms of German cities moulded upon them; an erroneous nomenclature which ought to be rectified. The finest specimens are clearly traceable to Germany—probably to Cologne. The ware was made in moulds, and usually dated from 1550 to about 1687. Buntzlau, Harburg, and Grenzhause, were also noticed, and Creussen, in Bavaria, where the earthenware jugs (with the apostles ranged round them in relief) were made. Teylingen, in Holland, is celebrated in ceramic history from its association with the unfortunate Jacqueline, Countess of Hainault, and the manufacture of an earthenware cruche, called, after her, “Jacoba Kaunebje.” This princess was wife of John Duke of Brabant, and after many severe trials she retired, 1433, to the Chateau of Teylingen. While here (according to the tradition) she employed her leisure in superintending the manufacture of cruches, which were thrown into the moat of the chateau, that in after ages they might be considered works of antiquity. This ware is of common quality, without any ornamentation. The *Jacoba Kaunebje* figured by Marryat, in his history of pottery, is actually a superb Cologne ware canette, with designs in relief, and nearly two centuries later in date. The next manufactory of importance was Delft, celebrated at an early period for its enamelled fayence. It was probably about the time of the introduction of Chinese porcelain into Europe that the Delft potteries sprang into active existence, and no examples are known of an earlier date than 1630. The importance of the manufacture went on increasing throughout the 16th century, but the commencement of the 17th century witnessed its greatest development. At that time there were nearly fifty fabriques in full work at Delft. In the middle of the 18th century they were reduced to twenty-four, yet making a considerable quantity of pottery. At the present day, of all this number only one remains, and its productions are of a very inferior character. Mr. Chaffers described the varied forms of Delft ware, and among other curious efforts of the potters, some violins and other musical instruments. In introducing the subject of Chinese porcelain, the early and extravagant myths were briefly adverted to, being mixed up with historical facts. The Chinese historians attribute the first discovery of the secrets of the ceramic art to the reign of Hoang-ti, 2,698 years before our era. This pottery was a sort of hard stone ware. The true porcelain was not invented until about 185 B.C., sixteen hundred years before it was known to the western nations of the globe. The word *porcelaine* has existed in the French language since the 14th century, long before the introduction of China ware into Europe, and it was then applied to mother-of-pearl, and not to porcelain in our present acceptance of the term, but, from a certain similarity, it became in the 16th century generally so called. The Chinese kept the composition of porcelain a profound secret, and endeavoured to deceive travellers by all manner of wonderful tales; one of these strange conjectures being, that it was nothing more than a mass composed of plaster, eggs, shells of marine locusts, and other similar compounds, which, being well mixed together, was hidden secretly under ground, where it remained 80 years, and was left as a valuable heir-loom by the Chinese to their descendants as being of greater value than gold. There

are numerous manufactories of porcelain in China, and the lecturer described the most important of them, the fabrique of King-te-tchin, established in the sixth century, and taken under imperial patronage in A.D. 1004. The city contains more than a million of souls. The expense of procuring materials must have been considerable, for the wood for the furnaces had to be taken a hundred leagues, and provisions were dear, yet all could here find employment. The young and old, the lame, and the blind could earn a livelihood by grinding colours, or in other ways. In 1700 there were nearly 3,000 furnaces constantly burning, which presented at night the appearance of a town on fire. After a very interesting account of King-te-tchin, the lecturer concluded by stating that it was now a heap of ruins. In the course of the recent disturbances which have convulsed the country, the Taepings sacked and pillaged the imperial manufactory, destroying all the kilns and workshops, giving a fatal and irrecoverable blow to this particular industry in China. The porcelain tower of Nankin was built in 1403-1424, by the Emperor Yong-lo, on the site of an earlier structure of other materials. It is not, therefore, so ancient as generally supposed. The tower was octagonal, and consisted of nine stages elevated on a pedestal of the same form—261 feet high. It was built of brick, encased with tiles of porcelain, the quality of the ware being equal to that of which the ordinary vessels are composed. Each stage had a projecting cornice, and at every angle a bell, eighty in all; when agitated by the wind they produced a sound which, at a short distance, might have been taken for an Eolian harp. The Emperor Khang-ti visited it in 1664, and caused it to be repaired. The structure has recently been completely demolished by the Taepings, and not a fragment is left to mark the site of this once celebrated monument. The various monuments which are found upon the ware and the deities were explained. The dragon, emblematical of imperial dignity, is provided with five claws. Princes of lower rank bear the same dragon with four claws; others only three; while the mandarins are only allowed a serpent with four claws, called *nung*. The Khylin and the Dog of Fo were exemplified by specimens, and other symbolical animals referred to. The porcelain of China is composed of two earths, the one a decomposed felspathic rock called *kaolin*, and the other a rock of the same geological origin, mixed with quartz, called *petuntse*. There being a perfect identity between these elements, they both harmonize so completely that they have an equally resisting power when placed in the kiln. The *kaolin* used in making this porcelain is much softer than *petuntse* when dug out of the quarry, but it is this which, by its mixture with the other, gives strength and firmness to the work. It is by a modification of the glaze, so as to render it more or less expansive when submitted to the heat of the kiln, that the well-known variety called *crackle* is produced. The porcelain made and decorated at King-te-tchin is not known of an earlier period than the commencement of the fourteenth century. The vases of the Hong-wou period, 1368-1398, and those of Yong-lo, 1403-1424, are generally rude in design and of imperfect fabrication. Under Siouen-te, 1426-1436, a vast improvement is perceptible. These are frequently met with. The best period, however, of Chinese art is the *Tching-hoa*, which continued from 1436 to 1487. The most ancient mode of decoration was the blue camaieu, and it is still much esteemed in China. On this blue ware Chinese characters are frequently found denoting the period in which they were made. Few of the ancient pieces painted in colours are marked, and it is therefore difficult to tell even their approximate date, especially as there was a conventional mode of decoration which had been practised from time immemorial; the painters worked according to given models or patterns, and the same uncouth and rude designs were passed through successive ages, upon the ware.

Mr. Chaffers, by the aid of diagrams and examples, clearly explained the means by which the dates or periods could be deciphered with certainty. They usually consist of six marks, the two first express the dynasty, the two next the period, and the two last signify "made during," like our expression *fecit*. Characters, in a square seal form, were used from the commencement of the 18th century, either stamped or stencilled in red. Mr. Chaffers explained the manner of deciphering these characters, so as to tell the exact date; they are the same meaning as the others, but made angular instead of curvilinear, to suit the squareness of the seal. In speaking of the curiosities of porcelain, he exhibited some cups, with an outer reticulated covering, completely insulated from the inner vessel, except at the rims at top and bottom, where it is joined. These were used for tea or hot liquids, and can be held in the hand with impunity, notwithstanding the heat enclosed. Another variety consists in cutting or punching out pieces of the paste or body of the ware in patterns before it is baked; it is afterwards dipped in glaze, which fills up the holes. The pattern, being much more transparent than the body of the ware, is distinctly seen when held to the light. Others were made with movable bands, in such a manner that although separate they cannot be altogether removed from the piece. The wonder is that in the baking, the edges in juxtaposition should not have become cemented together. Other curiosities were shown, as the "Cup of Tantalus," puzzle-jugs and teapots, swimming tortoises, &c. The porcelain of Japan was fully described. Its discovery took place about 27 A.C., but it was not until 1211-1221 that it was fully developed. The porcelain is very much like that of China, but the colours are more brilliant on the fine pieces, of a better finish, and the designs more of the European character, the flowers being more natural and the monsters less hideous; the paste is of better quality, and the glaze a purer white, especially in the 17th and 18th centuries. The beautiful egg-shell porcelain was spoken of, and specimens of ancient and modern manufacture were shown—some covered with bamboo threads woven together with wonderful precision. The Japanese excel in a particular fabrication which is almost peculiar to them—the lac, usually called Lac Japan. It is a resinous gum, which exudes from certain trees, especially the *Rhus vernix*. This varnish is applied by them to a great variety of materials, and is sometimes inlaid with mother-of-pearl in landscapes and flowers, birds, &c. The usual colours are red, brown, and black, of different shades, and gold is used upon it with effect. Lac was frequently applied to porcelain vases, either entirely covering the surface or only partially in relief.

Some specimens of the Satsuma porcelain were exhibited, brought to this country by the English officers engaged in its bombardment some years since. Also some china made in India, painted with Hindu deities. The table was filled with a choice collection of specimens of German stoneware and Oriental porcelain, kindly lent to the lecturer, to illustrate his remarks, by Mr. H. G. Bohn, Dr. Diamond, Mr. Durrant, and Mr. Wareham.

TENTH ORDINARY MEETING.

Wednesday, February 13th, 1867; WILLIAM HAWES, Esq., Vice-President of the Society, in the chair.

The following candidates were proposed for election as members of the Society:—

Brand, Henderson William, 5A, Courland-grove, S.
 Chaffin, Matthew Henry, 18, Hart-street, Bloomsbury, W.C.
 Fowler, John R., 1, Mitre-court-buildings, Temple, E.C.
 Green, John, 7, Sherborne-street, N.

Harrington, G. H., 5, Billiter-square, E.C.
 Harrison, Frederic, 7, New-square, Lincoln's-inn, W.C.
 Hayes, Robert, 1, Pembridge-square, Baywater, W.
 Hoff, Edward, Carpet Manufactory, Louth.
 Hopkinson, John, York-place, Oxford-street, Manchester.
 Isaac, S., 2, Hyde-park-gate, W.
 King, Edmund, 1, Elvaston-place, Queen's-gate, W.
 Layton, James, The Wilderness, Baldoek.
 Lee, Richard, 39, Lothbury, E.C.
 Loughborough, Thomas, 23, Austin-friars, E.C., and
 Selwood-lodge, Tulse-hill, S.
 Macintosh, William, 24, Paternoster-row, E.C.
 Phillips, Henry Louis, 32, New Broad-street, E.C.

The following candidates were balloted for, and duly elected members of the Society:—

Atkins, Francis Henry, 62, Fleet-street, E.C.
 Barlow, James, Greenethorn, near Bolton.
 Burgess, A. W., 107, Strand, W.C.
 Chaffer, Thomas, 14, Great Howard-street, Liverpool.
 Greenwood, Thomas, 28, Waterloo-road, Cheetham, Manchester.
 Hayes, Henry, 31, College-green, Dublin.
 Richardson, William, Hartford Works, Oldham.
 Whitehead, Peter Ormerod, Rawtenstall.

The Paper read was—

ON ARTIFICIAL ILLUMINATION.

By D. N. DEFRIES, Esq.

The advantages and importance of artificial illumination are too obvious to need any remarks from me; nor need I dwell on its history from the period of early civilisation down to the present time; how a splinter of fir or kernel of a nut might have been resorted to for the purpose. Accident, probably, soon taught mankind that the resinous exudations of trees, the fat of animals, and the bitumen and naphtha of the mineral kingdom might be made available; and we are all familiar with the torch, the candle, and the infinite variety of lamps for the burning of fat or oil.

It is very probable that the earliest lamps were made of no set form, but that the fat or oil was placed in any convenient vessel and burnt by means of a bundle of rushes, dried moss or decayed vegetables.

As civilization advanced attention would naturally be directed to the form best suited for the object sought. The lamp—at first but little more than a circular vessel containing a combustible material—was gradually developed into the artistic forms of the ancient Greeks, and in our own times has received the improved appliances which science has enabled the moderns to adapt to it. At a very early period it must have been observed that when an attempt was made to enlarge the wick beyond a certain point the flame became dull and smoky. To remedy this it was customary to split the wick, so as to divide it into a number of smaller flames, each of which would allow the atmosphere freely to circulate round it so as to keep up tolerably good combustion. In 1780, Argand made the first great step in advance, and, by means of cylindrical wicks, supplied air for combustion to the inside as well as the outside of the flame. All the subsequent improvements of this invention have been made with a view of adjusting the wick, and directing the current of atmospheric air into the body of the flame. The first was accomplished by means of a rack and pinion, the second by various forms of fountains and syphons; and in the Carcel or moderator lamp by means of a piston and pressure from a spring. Count Rumford invented the reservoir, and Parker placed the oil above the level of the flame. For the combustion of volatile oils and naphtha, lamps of very different construction are required, and great care had to be taken to secure a due and regulated supply of air to the flame, and contrivances for preventing the heat from volatilising these liquids became necessary. These are the invention of

several well-known men, amongst whom the names of Beale, Holliday, Luderstoft, Keir, and Young may be mentioned.

The "Bude" light of Mr. Gurney is only an extension of the principle of the Argand lamp, in which, in the place of atmospheric air, a jet of pure oxygen is passed into the centre of the flame, and by this means the combustion and light are greatly increased; but, in consequence of the complicated nature of the apparatus and the careful attention necessary in its management, it has never come into general use.

Before leaving the subject of lamps, I may be permitted to observe that the "Paraffine" lamp, when properly constructed and used with the best kind of paraffine oil or petroleum, is an excellent and economical means of illumination, and, with careful attention, is perfectly safe; but, on the other hand, if bad oil is used and the lamp overheated, explosions may occur.

It would take too much time for me to speak of all the materials used in the manufacture of candles, and the manipulation is so well known that I need not describe it. We are all familiar with the history of coal gas, so largely used now both in private houses and for the illumination of public buildings and our streets. The mode of manufacture and its purification have been so often described and are to be found in so many printed treatises, that I should not be justified in entering upon them now.

To relate to you the progress of gas—Murdoch's first application of it to lighting purposes, down to the efforts of Winsor, and the formation of the "Chartered Gas Company," and subsequently down to the present time—would be repeating an oft-told tale. The number of gas companies now in existence will, I think, be sufficient to show that the prejudice which at first existed against gas light is now overcome. But, notwithstanding that the subject is generally familiar, and although gas is so largely used, yet the public are but little acquainted with the methods adopted for burning it, and what burners are specially adapted for the various purposes for which the light is intended. The burning of gas has gone through nearly as many phases as the burning of the various other materials to which I have alluded, from the rude and simple pipe or orifice, whence the gas issues with combustion as imperfect as that of the original torch—and bearing indeed a great resemblance to it—down to the carefully-adjusted jets and their uniform variety of one supply of air. The flaring lights of our butchers' shops, with their enormous consumption of gas, are the types of the one; the fish-tail, the argand, and the sun-light, which after all is but a variety of the fish-tail, are types of the other.

Scarcely anything connected with the subject of gas illumination has commanded more attention than the means whereby gas may be burnt to the best advantage; and although the greatest ingenuity has been displayed, yet none of the arrangements possess that universal applicability for which they have been, in most cases, so highly vaunted. The reason of this is obvious; different kinds of gas require different forms of burner in order to effect perfect combustion. As a rule it may be stated, that the rich canal gases are best consumed from burners with fine apertures, while the poorer gases are burnt with most advantage from larger apertures. Again, in the former case, provision should be made for a large supply of atmospheric air, as by spreading out the flame by means of an internal button, or by using tall glasses, whereas, in the latter case, the opposite condition should be observed. It is manifest, therefore, that no single burner can be constructed so as to secure both these requirements, and consequently that any burner which is well suited for one kind of gas is altogether unfit for the other. The most prominent gas burners in general use are as follows:—The simple jet, which is produced from a burner pierced with a single hole. This mode of consuming gas is not considered to

be cleanly or economical, and, except for certain purposes of illumination, where we wish to produce some kind of device, is rarely employed. The "cockspur" burner is a burner with three or more jets radiating off from it, and burning separately. The light from such a burner is only equal to the sum of the individual jets, for, as they do not coalesce, they cannot in any way assist each other. It is one of the worst burners that can be employed. The "fish-tail" burner is the result of two small jets of flame impinging upon each other under a certain pressure. Probably, though so common in its use, it is but little known how the pure flat leaf of flame is produced in the fish-tail burner. The jet, instead of one perforation, has two, which meet at their exit, and the streams of gas as they issue impinge on each other, and thus spread out into that flat flame which is so familiar to us all. The "bat's wing" burner is so named on account of the shape of the flame. It is one of the oldest forms of gas burners; it is constructed with a fine slit, instead of two holes, for the exit of gas, and the flame is broader and not so high as the fish-tail. These burners are easily managed, and on this account are generally supplied to the public lamps.

The "sun burner" is a cluster of "fish-tail" burners placed round a common axis, and spreading out in a horizontal direction, so as to produce the figure of a flower, or of the sun. This burner is so constructed that the products of combustion are carried out of the room by means of a ventilating funnel and tube placed directly over it. In most cases the sun burner consists of seven clusters of nine fish-tails each. The burners are supplied with gas from a descending pipe, which branches to each cluster, and surrounding the whole is a sheet-iron cone, with a tube attached to the top, for carrying off the products of combustion. In this tube there is placed a butterfly-valve, for the purpose of regulating the current of air, so that the draughts may not be too great, and the lights may burn in a horizontal direction. Around the cone are placed other iron cases, which not only serve for ventilation, but also insulate the inner cone, and, by their cooling effect, prevent the intense heat of the latter from being communicated to the woodwork of the ceiling. These cylinders are not connected with each other or the cone, and therefore distinct currents of air pass between each of them; such is the cooling effect of these currents, that while the cone is hot, the two outside cases are of the same temperature as the atmosphere of the room. On the upper part of the cylinders there is an inverted cone, with a pipe passing through the ceiling and roof, protected on the outside by a wind-guard, which allows the hot air and products of combustion to escape.

The "Argand" burner produces a flame which is exactly like that of an ordinary Argand oil lamp. The burner consists of a circular disc of iron, pierced with a number of holes. It is hollow in the middle, for the purpose of allowing a supply of air to the interior of the flame; and the jets of gas coalesce, so as to form a hollow cylindrical flame. A glass chimney is placed round the burner, in order that the supply of atmospheric air may be copious and steady. The number of holes, or jets, varies from ten to thirty for ordinary gas, and from thirty to ninety for canal. In the former case the holes are comparatively large, and in the latter they are very small, as in the case of the fish-tail burner. Several patents have been taken out during the last few years for improvements in this form of burner; they have chiefly been directed to the lessening of the shadow which is cast by the ring and body of the apparatus. Leslie's Argand is constructed to allow a current of air to pass up between each of the jets, and so destroy, to a certain extent, the continuity of the flame. This is effected by a number of small tubes, which rise to an inch or so above the ring which supports them. These tubes are made to converge a little as they advance upwards, thus forming a truncated cone. The glasses are constructed so as to deflect the air into the flame; and

they are of different heights in order that they may be suited to different amounts of consumption.

I will now draw your attention to some of the processes for carburetting, as it is termed, that is, supplying to the gas before it is burnt the vapour of some volatile hydro-carbon, so as to increase its illuminating power.

Many inventions have been proposed for increasing the brilliancy of coal gas, and at the same time for rendering it more economical and innocuous. One was to pass the gas through an apparatus where a large surface of a liquid rich in carbon was exposed. This acted very well for a short time, the gas taking up large quantities of the hydro-carbon vapour; but the more volatile portion of this being consumed first, and only the heavier and less volatile liquid being left behind, it necessarily yielded less and less vapour, and the gas became poorer until it ceased to be in any degree improved. Besides this, the tarry and watery vapours were condensed in the interior of the apparatus, and rendered it after some time useless. Many forms of carburettors have been devised for getting rid of these difficulties, with more or less success. I refer to those invented by Woodward, Carless and Blagden, Saul and Armstrong, the Photogenic Gas Company, and others. The latest which I have seen is one invented and patented by Mr. Welch, wherein the reservoir is placed at the upper part, from which, by a simple arrangement, the liquid descends only as required to maintain the proper supply of vapour. This is brought about by the pressure of the gas itself, all floats being dispensed with. To prevent the apparatus from being obstructed by tarry and watery vapours, a chamber is placed at the bottom in which these are condensed, and they can be drawn off through a plug placed there for that purpose. The "carburettor" requires no attention beyond refilling periodically, the diminution of the intensity of the light showing when that operation is necessary.

There are certain illuminating agents which do not vitiate the air of the room; only two of these I shall mention this evening. The oxy-hydrogen, or "Drummond light," and the "electric light." The oxy-hydrogen light was first introduced to public notice by Lieutenant Drummond. It consists, as is well known, of a jet of oxygen and hydrogen gases which is projected under great pressure upon a cylinder of lime. The high temperature which is thus produced renders the earthy body so incandescent as to be intensely luminous. Another mode of obtaining this light is to throw a jet of oxygen into a flame of spirits of wine or ether, or mix the oxygen with coal gas instead of pure hydrogen. The electric light is produced as follows:—The electricity is conveyed from the battery by wires which should be of large size, so as to conduct it with ease, and should be covered with gutta-percha, so as to insulate them. Light may be obtained from the battery in two ways, either by bringing the poles into contact with a yard or so of platinum or iridium wire, wound into the form of a spiral, or by terminating them with cylinders of charcoal and then bringing these into contact. In each case the light is produced by the ignition of the conducting medium. Platinum or iridium is not so well suited for the purpose as charcoal, because, in the first place, the light is never so vivid, and, in the second place, the metal is very likely to fuse, and put a stop to the experiment. When charcoal is employed, it is found that the greatest intensity of light is produced by drawing the points apart from a quarter to half an inch, and then there is a stream of finely-powdered charcoal in a most intensely ignited state, forming an arc of flame. If the charcoal points are too close together we do not obtain the maximum effect, and if they are too far apart the arc is broken and the light extinguished. This it is which constitutes the difficulty in keeping up the electric light, and which gives the flame its unsteady and flickering character.

There have been several electric lamps invented, but

the most perfect are those of MM. Duboscq and Serrin, of Paris.

Mr. Holmes has, within the last few years, made a considerable improvement in obtaining electricity, by constructing a large magnetic machine, which is driven by steam power, a description of which he gave in this room a few years ago.

The last magneto-electric light is that of Mr. Wyld. It is sufficiently brilliant for photography, but the apparatus is so ponderous that it requires steam power to work it.

Before quitting this subject I must not forget to mention the light caused by the ignition of the metal magnesium; but the great difficulty in getting this light to burn steadily, and also the expense of the metal, tend greatly to preclude its introduction into general use.

The last invention with regard to artificial illumination is the Angstrom light, produced by causing atmospheric air to take up a large quantity of a very volatile hydro-carbon by means of a carburettor especially constructed for the purpose. This has been often attempted but without any practical success till now, owing to the defective arrangement of the apparatus. In Mr. E. Welch's machine the air is pumped by clock-work. As soon as the receiver is full, the lever is lifted, and stops the descending pump in its course by turning off a very well ground-in valve, thus arresting the movement of the clock-work. The air from these two pumps passes through into the receiver or governor, as it is sometimes called. The receiver is so weighted as to give the requisite pressure to the air for driving it through pipes. From the air-holder the air passes through the carburettor, where it takes up the hydro-carbon vapour. The construction of the carburettor is very complete and effective, and serves either for air or gas; but those for gas have much less surface than those for air. The hydro-carbon, though highly volatile and inflammable, is not explosive. This hydro-carbon can be extracted from most of the commercial, hydro-carbon oils, such as petroleum, &c., but its manufacture is only known to the inventor and a few others.

In conclusion, I desire to call your attention to a most important subject, namely, that of street illumination; and I think that you will agree that there is great room for improvement in this branch of artificial illumination.

The present mode of lighting the public thoroughfares is very inefficient, inasmuch as the lamps now in use merely act in the distance as beacons, to show the line of demarcation between the road and the pavement, and when one is close to them they are comparatively useless, as nearly all the light is thrown upwards, and upon the walls of the houses, the place where it is not required; indeed, I have found it almost impossible to read a letter under the brightest lamp. The place where the light is wanted is in the road and on the pavement; and to remedy the present defect, I should advise the burners being placed horizontally, instead of perpendicularly, as they are now; the result of this slight and inexpensive alteration would be that the pavement and road would be well lighted, and none of the rays would be lost. I have, after several experiments, contrived a burner which is now alight in a lamp, also of my own design; it is very simple, not liable to get out of order, and shadowless. The upper portion, forming a concave reflector, is proposed to be made of enamelled iron, it being very durable, easily cleaned, and capable, in case of accident, of being replaced at small cost. The bottom is a semicircular glass globe, which, like the top, would cost but little to replace in case of breakage. The whole is connected to the pillar by a clamp and vulcanized india-rubber washer, and is so firmly fixed that the strongest gale of wind cannot affect it. The top reflector is fastened on to the globe by means of screws or clamps. The burner is in the form of two bird's wings, one of which is to give light on the pavement, and the other on the road. These burners can be constructed to pass the

usual amount of gas allowed for street lamps, viz., from four to five feet per hour. I wish it to be particularly understood that I have not spoken upon street illumination for the purpose of introducing this lamp and burner, but I have thought that it was time that such an important subject should be prominently brought before the public.

DISCUSSION.

Mr. KING wished to ask Mr. Defries whether, in having two flames, as in the case of the burner he proposed, instead of one, for the street lamps, there was not a loss in the illuminating power? It was a well-known fact in gas lighting, that a single burner, consuming 5 feet of gas per hour, when divided into two burners, each consuming 2½ feet per hour, involved a loss of 25 per cent. of illuminating power. That would be found to be the case with the street burner now exhibited. He granted that the horizontal projection of the flame utilised the light; still, by the division of the flame in the manner shown, there must be a great loss of illuminating power. Having had considerable experience in the carburetting of gas, he might say, with reference to the apparatus before them for that purpose, and the remark of Mr. Defries that the oil was non-explosive, that he had mixed it with air in certain proportions, and exploded it with an electric spark.

Mr. CHAFFINS inquired whether the elegant-looking gas standard exhibited was much more costly than those now in use?

After a few words from Mr. ASH,.

Mr. ELL, on the subject of the present imperfect street lighting in the metropolis, said he thought the blame did not rest with the vestries and district boards, as had sometimes been asserted, as we were entirely in the hands of the gas companies in that matter. The local authorities made the contracts with the gas companies, but the servants of the companies lighted the lamps, and the vestries had no control whatever over the lamp-lighters. He did not wish to utter a word of suspicion as to the gas companies desiring to defraud the public in respect of the street lamps, but their servants were sometimes careless; and it was within the knowledge of all present that half the street lamps were not turned on so full as they ought to be. They were probably aware that great reforms in the matter of gas lighting in London were contemplated by the Government and the Board of Works, and he hoped one provision of the new measure would be to give the local boards more control over the public lighting than they had at present. For his own part, he thought it would be much better if the street lamps were so arranged that the tap, when turned on fully with a stop, should give the amount of light which was bargained for on the part of the public, and that the lamps should be lighted by persons under their control instead of by the servants of the gas companies. He was very much struck with the appearance of the standard for street lamps shown by Mr. Defries, but, as far as he could judge, it did not appear to yield so much light as the present single burner in the street lamps when properly turned on. That might be owing to the division of the burner into two. It must be admitted on all hands that there was considerable room for improvement in the existing lamp standards in London, both as regarded the pattern of the pillar and of the lantern. He was glad to find that in the City some improvement in this respect had already taken place, and he hoped the vestries and district boards of the metropolis generally would follow that example, and that, gradually, there would be introduced into the main thoroughfares standards a little more pleasing to the eye than the unsightly things now erected.

Mr. WEBBER thought this present mode of distributing gas through large iron mains was both clumsy and

expensive. He thought some lighter and less costly material would answer the purpose.

Mr. DEFRIES, in reply to the questions put to him, said, in the first place, with respect to the hydro-carbon used in the apparatus of Mr. Welch, his information with regard to its non-explosive nature was derived from Mr. Welch himself, and was confirmed by his own experiments. The secret of the manufacture of this hydro-carbon remained with those who had introduced it; all he could say was that it was perfectly unexplosive. In the next place, with regard to the alleged loss of 25 per cent. in illuminating power from dividing the burner into two jets, he would say that two lights even of less illuminating power when placed judiciously were better than one light of greater illuminating power placed injudiciously. With respect to the use of a lighter material than iron pipe for the main distribution of gas, the traffic was so great that any light material would be soon destroyed.

Mr. GEORGE WHITE suggested that the lantern in the gas standard exhibited would, he thought, be improved by the upper metal portion being made a reflecting surface, and placed a little higher above the light. He quite agreed with the objections that had been made to the present form of the lantern in street lamps, which gave light above rather than below, and the shades of the bars cast beneath were perplexing to people of imperfect sight who might be crossing the road. He thought, with little additional cost, they might have a form of lantern which could cast the light where it was wanted, and obviate the gloom caused by these shadows. He would also say a word on behalf of the local authorities in respect of public lighting. To his own knowledge many of the vestries were very anxious to get a better-looking lamp-pillar than the one now in use, and he was pleased to see that the Society had had one brought there for inspection. He would like to see a competition of twenty or thirty designs of lamp posts, from which a good one might be selected. A great difference was observable between the public lights and those in the shop windows, which was no doubt in consequence of the more intelligent mode adopted by the shopkeepers in consuming the gas. He was further struck with the fact that in those streets which were the best lighted from the shop windows, the public lamps were always lighted a considerable time before those in the more private streets. He thought the reverse of that ought to be the case, and that in many of the main thoroughfares, consisting entirely of shops, many of them lighted by twenty or more burners, the public lamps did not require to be lighted till the evening was somewhat advanced, and when the shops began to be closed. He would say a word or two with regard to the position of the gas companies, and as to whether the Government should take up the question of the gas supply in the metropolis. He thought that public companies were often blamed when they did not deserve it. The introduction of gas lighting, as they well knew, was brought about by the enterprise of individuals who formed themselves into public companies, and, by the traffic in shares and the profits derived from the gas manufacture, made large sums; but they gradually became close corporations, doing very much as they liked as to the prices they charged for their gas. It was well known that gas was produced at the works at a cost of 1s. 8d. per thousand feet, and the expense of distribution was 1s. more—the remainder between that and the price charged to the consumer being profit to the company. It was true they were restricted to 10 per cent. profit, but they were not restricted as to the most economical modes of manufacture and distribution; and the limitation of the dividends under the monopoly in gas which now existed in London, did not tend to such a reduction in the cost to the consumer as they had a right to expect. Why should not gas lighting be thrown open to competition, and conducted on free-trade principles like any other

business? If that were done the public would take care to supply themselves with the best quality of gas they could obtain. Some people were in favour of putting this matter into the hands of the Government. He thought that would be only "getting out of the fryingpan into the fire," because private companies were amenable to public opinion, which would not be the case with the Government.

In reply to questions put by Mr. BLACKIE and other gentlemen,

Mr. DARRIS stated that the consumption of the two jets burning in the lamp before them was only 3-4 feet per hour, the standard of consumption in the present street lamps being five feet per hour, the lantern in the latter case being placed some three feet higher than was required for street lighting. The cost of the glazed portion of the lantern was not more than two shillings and sixpence. The first cost was less than that of the present lamp-posts.

Mr. KING said, three or four years ago he drew the attention of Dr. Letheby to a lantern somewhat similar to that now before them, having a metal top and semi-spherical glass bottom, with a view to its introduction in the City; but an objection was taken to it on account of the gloomy effect produced above by the opaque metal top. It was well-known that coal gas depended for its illuminating power upon the quantity of carbon it contained; but they might overburn that carbon; and, to get the full amount of illuminating power out of the carbon which was in the gas, they must supply it with only the necessary amount of air and no more. If too much air was supplied the carbon was overburnt, and there was a corresponding loss of illuminating power. This was obviated to a great extent by the argand burner. With regard to the lamp before them, he believed it did not at that time give the light of more than five or six candles, whereas a public lamp was expected to give the light of twelve or thirteen candles. It was a question with him whether the horizontal position was the best one for the flame. If the gas were carburetted, and the flame placed in a horizontal position, it would almost fill the lantern with smoke. Care must always be taken to use a kind of burner which was suitable for the description of gas burnt. Gas rich in carbon required to be burnt through fine apertures; if large apertures were used imperfect combustion resulted.

The CHAIRMAN said, before proposing a vote of thanks to Mr. Defries for his interesting paper, which had elicited a no less interesting discussion, he would offer a few remarks on the subject. Mr. Defries had very ably treated the practical portion of the subject of gas illumination, but in the discussion reference had been made to what he (the chairman) considered a more important branch of the subject, namely, the question as to the propriety of the supply of gas being continued in the hands of the companies, or whether it should be taken from them and undertaken either by the City authorities or the Government as a means of improving the supply in respect of regularity and economy. Many persons present would recollect a few years ago there was a great effort made to obtain what was called a consumer's gas company in the City of London, which took the name of what it was intended to be in reality—"The Great Central Gas Consumers Company." The result of that attempt, in which all kinds of influences were used to show how inferior was the gas supplied by the old companies, and how important it was that the consumers in the City should have better gas at a lower price—the result had been to show that the company formed under such circumstances had gradually become as great sinners as the others, and were as anxious to maintain the price of gas as they had ever been. There was nothing more than a repetition of what had happened before. Complaints were made, not always based upon reason, and frequently not on fact, and in the end the public had to pay for the formation of this new company, and the interest of the

capital expended in addition to what they paid before, without realizing the expected improvement in the quality, or economy in the price, of the gas. He did not think placing the monopoly in the hands of the Government or the Board of Works would give them gas so cheap or a supply so constant as when it was in the hands of half-a-dozen or more companies, who were anxious, by the good quality of the article they supplied, to secure customers on the one hand, and a good dividend for their shareholders on the other. As to free trade in gas, he thought they had it sufficiently already, as was shown by the inconveniences occasioned by the constant breaking up of the streets for the laying down of pipes. If the public were not satisfied with the gas of one company, they could, in many cases, take that of another. He was quite aware that the system of distributing the metropolis among the several companies had been carried on to a great extent, but there were still some localities where a supply could be had from more than one company. There was competition in the city, where the consumer had the opportunity of comparing the quality of the gas of one company with that of another. With regard to the lighting of houses and shops, the illustrations of the different forms of burner given by Mr. Defries that evening were highly interesting. The question of carburetting the gas was no doubt a difficult one on which to give a decided opinion. It had been adopted in many places, no doubt with great advantage, but he doubted whether it would be successful on a large scale. They had in the room in which they met the great advantage of that admirable system of lighting known as the sunlight, which not only afforded the best possible light, but at the same time aided in producing good ventilation. The magnesium, the oxy-hydrogen, and the electric light were useful under particular circumstances, and were interesting as matters of scientific experiment, but scarcely entered into the question of internal illumination. He thought they might look forward to great improvements in this matter if, as he believed was contemplated, the gas works were carried further out of London, and the sites of the present works appropriated to more profitable purposes. He looked forward to London being supplied with a better quality of gas, at a cheaper rate, under the influence of purely commercial competition, rather than as the result of any government interference. By the concentration of the gas works, a corresponding economy in the manufacture would result, and the public would receive greater advantages than would ensue from taking the business out of the hands of the companies and placing it in the hands of the Government, or in those of any centralised municipality. He had now only to ask the meeting to record their thanks to Mr. Defries for his able and interesting paper.

The vote of thanks was then passed.

Mr. Defries illustrated his paper by showing the various forms of artificial illumination, including the electric, magnesium and oxy-hydrogen lights, the Augasma light, and the various forms of gas burners, with the modes adopted for carburetting gas.

THE "COURSE" SYSTEM FOR LONDON CABS.

By JOHN L. HADDAN, Esq., C.E., HACKNEY CARRIAGE DEPARTMENT, METROPOLITAN POLICE.

In the *Journal of the Society of Arts* for last week, Sir Richard Mayne, K.C.B., is reported to have stated that—"He considered the system of fares by the 'course' the one best calculated to avoid disputes; but he believed that to be inapplicable in a place of the vast extent of London, though at the same time payment by distance must necessarily lead to disputes, and, in the case of strangers, to overcharge." Acting on these words,

emanating from such an authority as Sir Richard Mayne, whose opinion, owing to so many years' experience, must be most valuable, the following plan has been devised, which it is believed fully secures the requirements and meets the objections which he has so justly pointed out as vital ones.

It is quite obvious that any system of fares to be convenient must also be approximate, for it would be an endless source of dispute, besides requiring very accurate means of calculating distances if a fare were computed according to the exact distance travelled, for instance, $1\frac{1}{4}$ miles, at the rate of 6d. per mile, would be 7½d., a very inconvenient sum to pay, requiring small change.

The present system is also only approximate, a hirer paying the same fare for 1 mile 5 yards as he would for 2 miles, viz., 1 shilling.

The "course" unmodified would not be applicable to a large city like London. The same fare say, from Brixton to Mile-end, as from Langham-place to one of the clubs, would clearly not be sufficiently approximate.

There is no reason, however, why London should not be divided into a certain number of squares, or irregular figures, of about $1\frac{1}{4}$ miles area each; of which, within the four-mile radius, there would be 26, each square being distinguished by a letter of the alphabet.

The fare may be quite arbitrary, each square being considered a course; two squares, two courses; and so on; but, for the sake of illustration, I have adopted 6d. for each course or square, and only inserted 9 squares (instead of 26) in the tables:—

	A	B	W
			X
D		E	F
			Y
G		H	I
			Z

These fares are likewise only approximate, as in the one case the cabman might be hired, say, at Y and discharged at X, receiving 1s. 6d. for $1\frac{1}{4}$ mile distance (having passed into three courses), but from Z to W would be $4\frac{1}{4}$ miles, for which he would likewise only receive 1s. 6d.; this sum being found to be the exact mean fare for the two extreme distances, viz.:—

$1\frac{1}{4}$ miles at 6d. = 0s. 9d. minimum	
$4\frac{1}{4}$ " at 6d. = 2s. 3d. maximum.	
2) 6 = 2) 3s. 0d.	
3 = 1s. 6d. average.	

This, though quite just, seems, at 6d. per mile, rather hard on the driver; but it will be readily seen that by enlarging or diminishing the dimensions of the squares, or by altering their value, an exact scale can be arrived at.

Taking long and short fares together, the cabman would be the gainer, as for one person who went from extremity to extremity of a division there would be hundreds who took a medium course.

The table being compiled with the assistance of a map properly divided, the map, so far as the public is concerned, is dispensed with; the method of enabling the public to ascertain the limits of the various divisions must be more simple; and the method I propose is to have the initial letter of the district made of coloured glass, or cut out of tin, and affixed either to every lamp-post in

the metropolis or in the fanlight of every house—in the latter case the number of the house being also added thus:

FROM										TO
A	B	C	D	E	F	G	H	I		
s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	
0 6	1 0	1 6	1 0	1 0	1 6	1 6	1 6	1 6	1 6	A
1 0	0 6	1 0	1 0	1 0	1 6	1 6	1 6	1 6	1 6	B
1 6	1 0	0 6	1 6	1 0	1 0	1 6	1 6	1 6	1 6	C
1 0	1 0	1 6	0 6	1 0	1 6	1 0	1 0	1 6	1 6	D
1 0	1 0	1 0	1 0	0 6	1 0	1 0	1 0	1 0	1 0	E
1 6	1 0	1 0	1 6	1 0	0 6	1 6	1 0	1 0	1 0	F
1 6	1 6	1 6	1 0	1 0	1 6	0 6	1 0	1 6	1 6	G
1 6	1 6	1 6	1 0	1 0	1 0	1 0	0 6	1 0	1 0	H
1 6	1 6	1 6	1 6	1 0	1 0	1 6	1 0	0 6	1 0	I

EXPLANATORY.—On hiring a cab look at nearest lamp (say H); on discharging cab look at nearest lamp (say A). Refer to table H to A = 1s. 6d. A foreigner can as easily do this as a native, if knowledge of signs being requisite.

This plan quite prevents all chance of the driver going a roundabout way, his interest being to go as directly as possible; it also contains a very important feature, viz., that it states the exact legal fare from any one point to any other, and not, as at present, where, after going into tedious calculations and judging distances, the hirer arrives at what he imagines to be the right fare, but which he is by no means sure is the legal one; this, of course, renders disputes almost unavoidable—the cabman's idea of a mile being, naturally enough, the very opposite to that of the hirer. A foreigner or stranger must, of necessity, go to the wall under these circumstances. An index on a cab would never be in working order a week, it being the driver's interest to derange it as quickly as possible.

This system has the great advantage of being final, and not, as at present, subject to revision whenever changes of streets, &c., take place in the metropolis.

The plan and tables have all been worked out, the table only occupying a space of 9in. X 7in., in large type, is not too large to be affixed to the inside of every cab door.

All objections as to stoppages, rehiring, &c., during a course are met by the present system of hiring by time.

The cost of introduction would be but trifling, and the system working order in a month.

Fine Arts.

NEW COURTS OF JUSTICE.—The designs of the eleven competing architects are now on view in New-square, Lincoln's-inn. The chief purpose of the proposed new buildings is to concentrate the several courts of justice and the offices connected therewith, and the object of this concentration is to afford greater facility for the dispatch and accurate transaction of the law business of the country. The plot of ground on which the new law courts are to be erected may be described generally as lying between Temple Bar, St. Clement's Church, Lincoln's-inn, and Chancery-lane. The courts here to be concentrated are the Equity, the Common Law, the Probate and Divorce, the Admiralty, the Ecclesiastical, the Appellate Court, and the Bankruptcy Court. To these may be added "The Land Registry Office," "The Registry Office of Judgments, &c., affecting Land," "The Middlesex Registry Office," &c. Thus is made a total of no less than sixty-four courts, chambers, and offices. The printed instructions state that upon convenience of arrangement will mainly depend the success or failure of the concentration, and accordingly the architects have devoted no small pains to the ground plans and the distribution of the basement and floors above. Care has also been taken to obtain abundant light, to secure the quiet needful for the transaction of business, and the air essential to ventilation. The competitors have also been required to consider all points relating to acoustics, heating, water supplies, and prevention of fire. The detailed plans prove that much attention has been devoted to such arrangements, also to the no less important matters of ready ingress and egress, to the separation of the sight-seeing public from the profession, to refreshment courts, conference chambers, and generally to the convenience of witnesses, attorneys, counsel, and judges. The plans also provide a substitute for Temple Bar, loftier than the present structure, in order to facilitate the traffic of the Strand; likewise a bridge on the north side, over Carey-street. These two bridges are covered ways, and will serve as means of communication with the Temple and Lincoln's-inn. In addition to these bridges, it is proposed that a tunnel or subway shall be constructed under the Strand, between the Temple and the new courts, on the site of Temple Bar; and another, large enough for foot passengers and trucks, under Chancery-lane into the Rolls estate. The architects have also been required to consider the means by which the increase of street traffic may be accommodated, especially on the side of the Strand. Each series of designs includes plans, drawn to a scale of one inch to 16 feet, of each floor, sections showing internal construction, elevations of each of the four sides or fronts, and a perspective or bird's-eye view. The architect also gives in words a general description of his design, of the materials to be employed, and of the mode of carrying the plan into execution. In few words may be designated the general architectural features of the eleven several designs. Without a single exception Gothic is the style adopted. Three of the competitors, viz., Mr. Street, Mr. Burges, and Mr. Seddon, have chosen somewhat castellated, domestic, or secular forms. One, Mr. Brandon, obviously leans to ecclesiastical skylines and details, as marked in a couple of spires, and a central hall not unlike La Sainte Chapelle outside, and the nave of Westminster Abbey inside. Mr. Lockwood's Strand façade is crowned by a lofty tower, which recalls the campaniles of Belgium and Italy. His use of coloured stones and certain other details have points of analogy in Giotto's Tower and the Cathedral of Sienna. It may be said, generally, that the designs, as a whole, indicate foreign—especially Italian—influence. A striking feature in Mr. Lockwood's plan is the central hall, which may vie with that of Westminster. It should also be observed that in the

construction throughout there are no top or borrowed lights. Mr. Garling's towers are less prominent than most of his competitors, and he dispenses also with the central hall, which in other plans is wrought into a leading architectural feature. He is of opinion that a corridor better consults convenience. It may be remarked that Mr. Garling's is the lowest estimate. Mr. Deane, also, for convenience, breaks up his ground plan into distinct blocks. In this way he deems that light, ventilation, and ready access are more easily obtained. Mr. Waterhouse has followed, with modifications, the style of his own law courts in Manchester, which are quoted as precedents both by lawyers and architects. It is shown that his towers will form a striking group in the general view of the metropolis. The three remaining designs, viz., those of Mr. Abraham, Mr. Barry, and Mr. Scott, have this in common, that they surmount the central hall by a dome. In this country a dome is a new feature in Gothic architecture. In association with the pointed arch it is of Eastern origin; and Mr. Scott adopts the ogee curve, which the Saracens used at Cairo and elsewhere. It may be added that the highest of the ten estimates is above two millions, and the lowest slightly above one million sterling. Each competitor, except the successful one, receives £800. The architect whose plans are adopted will be paid 5 per cent. on the outlay.

Colonies.

LANGUAGES OF THE AUSTRALIAN ABORIGINES.—A Sydney paper says:—The Rev. L. E. Threlkeld wrote a work on the languages spoken by the Australian blacks, for the Great Exhibition of 1851; but little has been done since towards bringing them under those rules which govern that of more enlightened peoples. The Rev. W. Ridley, M.A., has, however, followed the example of Mr. Threlkeld, and compiled a grammar of the languages spoken by the aborigines of Australia, for transmission to the Paris Exhibition. This addition to philological research will be of interest to many in Europe, as the aboriginal languages are by no means insignificant in point of euphony or expressiveness. The author states that, limited as was his acquaintance with the several languages referred to, "he has met with abundant evidence of the remarkable regularity, and of the exactness with which the aborigines express various shades of thought. The inflections of verbs and nouns, the derivation and composition of words, the arrangement of sentences, and the methods of imparting emphasis, indicate an accuracy of thought, and a force of expression, surpassing all that is commonly supposed to be attainable by a savage race." The various languages treated of are—Kimilaroi, spoken by those who inhabit the country on the Namoi, Barwan, Bundarra, and Balonne Rivers, Liverpool Plains, and the Upper Hunter; Dippil, by the aborigines of the north side of Moreton Bay, and thence to Wide Bay, and the Burnett district; and Turrabul, the language spoken by the aborigines on the Brisbane River. There are also references to the laws of descent and marriage, and a comparison of the various languages. The work is illustrated with drawings.

Publications Issued.

THE WATER QUESTION. By J. Bailey Denton, Principal Engineer to the General Land Drainage and Improvement Company. (*Edward Stanford*).—This pamphlet consists of a letter, addressed (by permission) to the Earl of Derby, explaining a proposal for the supply of the metropolis from the higher sources of the Thames in conjunction with the storage of surplus

waters. The author begins by referring to the Rivers Commission, appointed the 18th May, 1866, "for the purpose of inquiring how far the present use of rivers or running waters in England, for carrying off the sewage of towns and populous places, and the refuse arising from industrial processes and manufactures, can be prevented without risk to the public health or serious injury to such processes and manufactures, and how far such sewage and refuse can be utilized or got rid of otherwise than by discharge into rivers, or rendered harmless before reaching them;" and, next, to the proceedings of the Committee of the House of Commons of last Session on the Thames Navigation Bill, which resulted in a compact between the several water companies of the metropolis and the late Government, who were promoting the Bill, by which all towns on the banks of the river are to be prevented from discharging their sewage into it, and the water companies are, with that understanding, to continue to draw their supplies from the river on an annual payment of £1,000 each; both the proceedings of the Commission and the arrangement of the Committee being based on the assumption that it is practically possible to "prevent the pollution" of rivers. This the author regards as a fallacy, and he maintains that the only way by which the rivers can be maintained in their aboriginal purity, and in a condition fit to drink, is to exclude from them, wholly and completely, contaminating fluids; but, inasmuch as all fluids flow to the lowest place, and rivers occupy the lowest place in all water sheds, with the sea as their ultimate destination, it is obviously impossible to "prevent the use of rivers" for carrying off, in some shape or other, the refuse liquid of the towns and lands within their water sheds. The Rivers Commission, seeing this insurmountable difficulty, adopted the views of a previous Commission "for inquiring into the best mode of distributing the sewage of towns," and recommended that irrigation should be employed, as the best mode of lessening the obnoxious character of refuse fluids before they arrive at their natural destination. They state in their report, that "all expedients for disposal of town sewage other than by application to land, seem to us, on one ground or another, objectionable." They declare that "sewage water, if passed over a sufficient area of grass land, passes off bright, tasteless, and without smell;" and add, "that irrigation will be found to be the mode of dealing with sewage which results in the largest amount of good to the land, and the smallest amount of harm to flowing water." With regard to irrigation as a means of purifying rivers, the author quotes the opinions of some of the leading chemical and medical authorities, including Sir Benjamin Brodie, professor of chemistry in the University of Oxford, Dr. Voelcker, Dr. Odling, and Dr. Fuller, who all appear to agree in the conclusion that no process can render sewage available for drinking purposes. Mr. Denton shows that the natural régime of rivers admits of the supply of pure and the discharge of polluted water at the same time, and urges that "instead of straining after such irreconcilable objects as using river water to dilute sewage in order that we may drink it, we should draw the line between the upper portions of our streams which can be maintained in purity and the lower portions of the same, into which the refuse of towns and populous places must in some shape or other enter to be discharged to the sea." He goes on to say—"Perhaps of all rivers the Thames, in its upper tributaries, commands the purest and clearest of water; and for some length downwards from the rise of the springs, the streams are remarkably free from organic matter. If, therefore, it is a *sine quid non*—as every one now admits it to be—that we should have in the metropolis a sufficient supply of perfectly pure water, we have, in the higher portions of the tributaries of the Thames, and in the supplies to be obtained by pumping and from storage, ample means of meeting all possible demands without going beyond the limits of the Thames water-shed. To abstract water from the tributaries

without injury to the navigation and mills, and a general service of the river below, proper measures for compensation must be adopted, so as to return to the streams as much water as may be abstracted from them under a certain fixed datum of service height. The present consumption of London may be taken as one hundred millions of gallons per diem: about one half is supplied from the Lea and from chalk springs on the eastern side, and the remainder from the upper Thames on the western. According to authorized published statements, the New River and East London Waterworks Companies have supplied, from the river Lea and from wells sunk into the chalk, nearly forty millions of gallons daily during the last dry summer, and under a strict conservancy of the Lea, they may continue to supply that quantity in a pure state instead of that in which it is at present. This quantity may, in fact, be regarded as a minimum, if storage, for compensation simply, be resorted to, and all sewage excluded from the river above the points of abstraction. By extending the system of storage to the collection of surplus water for direct service, the supply may be increased a very much larger amount. Under a like exercise of conservancy and storage, there is no doubt that the other tributaries of the lower Thames may be made to contribute their quota. They consist of the Yedding, Brent, Roding, Hog's Mill Stream, Wandle, Ravensbourne, and Darent. The Kent Waterworks Company have shown that more than five millions of gallons daily may be and are obtained from artesian wells sunk into the chalk, and the Essex Pure Water Company is advertising several millions of gallons daily from chalk springs at Grays. These figures show that we possess in the rivers and springs flowing from the chalk a valuable property within our own watershed which is by no means exhausted by the fifty millions of gallons supplied daily by the New River, East London, Kent, and Essex Pure Water Companies. The storage capabilities of the chalk streams are great when compared with the actual requirements of the population they would serve. For example, while the minimum daily flow of the Lea, at Field's Weir, during the drier month in the dry year (1861), in which the rainfall was 22·62, was about forty millions of gallons, the maximum in the same month (October), was upwards of seventy-two millions; and the several streams rising in the chalk are all affected in like manner. But I will confine my observations to the tributaries of the upper Thames on the western side of London, rising for the most part in the oolite. The quantity at present supplied to the metropolis from the Thames, at Hampton, does not reach sixty millions of gallons daily. This will gradually increase, and it will not be many years before we shall require eighty millions of gallons, or more. To arrive, however, at the quantity of water for which provision must be made from the upper tributaries we must have equal regard to the towns and villages dependent upon them as to the metropolis itself, and the whole supply should be viewed as one measure. The population of these towns and villages, was, by the last census, 179,884, and to supply this number of people with thirty gallons each will require 5,396,520 daily. This consideration will increase the present quantity to sixty-five, and the total future provision to, say ninety millions, to be obtained from the upper Thames. The area of land surface tributary to the Thames above Hampton is 2,352,640 acres; the average annual rainfall is slightly under 26 inches and the minimum 20 inches. As the total quantity of water required in the year for the population dependent on the upper Thames and its tributaries in 23,725 millions of gallons (i.e., sixty-five gallons multiplied by 365 days), it follows that less than half an inch of rainfall over the whole area, or less than one-fortieth part of the minimum rainfall, will suffice to meet the present requirement." After describing some of the means by which the water at _____ be economised, and a

considerable portion rendered available for storage, the author proceeds to speak of storage for compensation and supply. He says:—"The Thames and its tributaries are especially rivers of floods, and a single inch of rain falling in a day has been known to nearly double the volume when at its standard height. The proportion of the rainfall discharged annually to the sea by floods cannot be stated, but the minimum can hardly be less than three inches, or the quantity that has been represented as the perennial supply of the Upper Thames. This surplus alone will therefore amount to seven times the quantity required for metropolitan supply. It is difficult to state to what extent the storage of surplus waters may not be beneficially applied. It may be resorted to as a means of compensating the streams for pure water taken from them, as well as for direct supply. The extent of storage room that would be necessary would be 1,000 acres, of a mean depth of 20 feet, for the collection of water for direct supply; and 2,000 acres of mean depth of 10 feet, for compensation." The following is a brief description of the works proposed by Mr. Denton:—"The head of the proposed works would be the fork formed by the Thames and Severn Canal extending from its summit at Thames Head to its junction with the Thames at Lechlade) and the North Wilts Canal. It will be remembered that, during the last session of Parliament, the Thames and Severn Canal Company sought powers to convert their canal into a railway. It was then stated and admitted that the canal was not in a profitable condition. It would be necessary to purchase these canals, and, by rebotomming, convert them into impervious conduits for the collection of pure water from the upper portions of the Churn, the Swill Brook, and the River Ray, and of such additional water as may be obtained by the restoration of the three millions of gallons which now runs into the Severn, as well as by additional pumping at spots, distant from each other, along the line of colitic outcrop, whereby a considerably increased amount may be gained, which would otherwise be lost. Reservoirs would be made along the course of the three streams named, to afford compensation for the water abstracted from them. From Lechlade to the meadows just below Oxford (where it would be desirable to have a supply reservoir) a channel would be formed following the course of the Thames—paved with concrete, and embanked so as to allow of the utmost cleanliness and prevent the influx of surface drainage and flood water—which would act as a receiving conduit for the pure water to be furnished by the several tributaries which it will cross and meet on its way. The tributaries that would be crossed and met would be the Ampney Brook, the river Colne, the river Cole, the river Leach, the river Windrush, the river Evenlode, with the river Glynne, and the several minor streams which join the Thames above Oxford. At Oxford the receiving main would join the supply to be gained from the Cherwell and branches above the point of pollution, as well as by storage in reservoirs formed in the higher lateral valleys for direct supply. From the supply reservoir at Oxford another paved conduit would convey the water by Abingdon to a point near Wallingford, having received contributions of supply from the Ock and the Thame. From thence to Hampton the water thus collected would be delivered to the water companies' works by a covered channel, having received in its course the contributions of the Kennet River, the Loddon, the Colne, and certain springs rising near the main river, making up in the whole a supply of 80,000,000 of gallons daily. Oxford, Abingdon, Wallingford, Reading, Windsor, and the towns and villages on the banks of the rivers would have been previously supplied from the conduit as it passes by them to the amount of upwards of 5,000,000 of gallons daily. The open conduit, from its commencement at Lechlade to Wallingford, would be of a semicircular form. It would increase in dimensions as the tributaries added their quota to the volume. The covered duct would be 8 feet deep by 10 feet wide.

The mean fall would be nearly 20 inches per mile. From Lechlade to the meadows near Oxford the distance is 29 miles, and the fall 48 ft. 6 in. From this point to a point above Wallingford, the distance 23 miles, and the fall 40 ft. 6 in. From thence to Hampton, the distance is 75, and the fall, 121 ft. 6 in.—Total length, 127 miles; fall, 210 ft. 6 in. These works on the upper Thames would be extended to the necessary conduits connecting the unpolluted portions of the tributaries with the receiving main, and would include the construction of reservoirs, the purchase of the special mills affected, and compensation to landowners, &c. On the Lea, of the lower Thames, a similar, though reduced system of works would be carried out. The cost of the whole may be estimated at £4,500,000, including interest on money expended and attendant expenses." In conclusion the author points out the objections to abstracting the waters of one district for the purpose of supplying another.

Notes.

THE METRIC SYSTEM.—The Metric Committee of the British Association and the Council of the International Decimal Association announce that a conference with deputies of Chambers of Commerce and consular authorities in this country, for the purpose of promoting the practical use of metric weights and measures, and the introduction of an international decimal system of coinage, will be held on Tuesday evening, the 19th instant, at seven o'clock, in the Great Room of the Society of Arts, by permission of the Council. The questions more particularly to be considered are:—1. The legal position of the metric system in this country under the Permissive Act, without the corresponding power for stamping weights and measures of the metric system, and the legalisation of authorised standards of the same. 2. The introduction of metric weights and measures into the public departments, especially in the Post-office and the Customs; the official preparation of the tariff in metric equivalents, with authority to pay duty according to the same; and the preparation of statistics by the Board of Trade to represent the comparative value. 3. Means, which may be adopted by Chambers of Commerce for promoting the voluntary use of the metric system among merchants and manufacturers, such as the preparation of special tables for the various trades, for converting prices and quantities from the metric into the imperial system, and *vice versa*; and the exhibition of a mural standard of the metre in public places in the principal ports and market towns. 4. Steps to be taken for securing representatives of the Chambers of Commerce at the conferences to be held in Paris in connection with the special exhibition of weights, measures, and coins, during the universal exhibition. 5. The conditions of the International Monetary Convention lately entered into between France, Italy, Belgium, and Switzerland, in so far as it may be applicable to this country. The conference is open to members of the Society of Arts.

Correspondence.

THE CAB QUESTION.—SIR,—I regret that I was unable to attend the important discussion opened by Mr. Cole last week, on the subject of the cab conveyances in the metropolis, or I should have submitted that the evils in question are remediable by the application of a large administrative principle, which I have elsewhere expounded in its application to several branches of administration, and have termed "competition for the field," as opposed to the common practice of "competition *within* the field" of service, which some eminent economists concur with me in repudiating. I consider

that all public means of vehicular communication by carriages plying in the public highways must be subjected to regulations and responsibilities on behalf of the public, and that the means of doing so, and preventing the evils in question, will be to charge some one administrative authority (and, in the absence of others, the duty might well be charged on the head of the police), with putting up the entire field of service to competition by tenders in answer to the invitation, as in the instance of the postal mail or packet service:—"Will you (individual capitalist, or company) undertake to provide the required and specific service for the public (the whole field), with what sort of cabs or other vehicles, and at what rates of fares, for a given period?" I here venture to quote a few passages from a paper expository of the principle as applied to several branches of administration, read by me before the Statistical Society:—

"The present condition of the cab service of London is one which appears to me to be so prominently illustrative of the evils of the competition of multiplied capitals within the field of supply, against which the opposite principle is the only effective preventive, that I beg leave to advert to them. The number of cabs now licensed in London is 4,500. Each common cab and the two horses, with the appointments requisite to work it, is estimated to cost not more than £60, so that the capital engaged is in round numbers upwards of £270,000, provided by upwards of 1,800 small owners.

"The waste of the capital committed by these competitions within the field of supply is visible to the eye at all times and all weathers—in full stands or long files, waiting hour after hour, and in the numbers crawling about the streets looking out for fares. The cost of the keep of each horse is estimated at 18s. 4d. per week; the depreciation of horse stock is put down at 2s. 6d. per week each, and of the vehicle at 8s. per week. The market value of the labour of such a man as the driver of a cab may be set down in London at 4s. per diem. The stable rent is at least 5s. per week per cab and horse, and with other minor items the capital invested for man, horse, and vehicle may be set down at about 1s. per hour lost during every hour during which the cabs are kept unemployed. On every cab stand where in foul weather, as well as fair, a dozen cabs are seen constantly unemployed, the administrative economist may see capital evaporating in worse than waste, at a rate of 12s. per hour, 27 4s. per diem—or at a rate of between two and three thousand pounds per annum, to be charged on some one—i.e., the public. If all were employed, as the usual rate of driving is six miles per hour, they must be each employed at least four hours per diem to pay for their keep. If, however, the cabs were constantly employed daily, at least three horses must be employed, which would augment the charge by that of an additional horse at the rate of 4d. per hour. A large proportion of the cabs are employed during the whole 24 hours, but there are then two men, 'a night man' and 'a day man,' and three horses.

"It is probably a statement greatly below the fact, that at least one-third of the cabs are, the week through, unemployed; that is to say, one-third of the invested capital is wasted—a service for two capitals being completed for by three, to the inevitable destruction of one. As in other cases of competition within the field, efforts are made by violent manifestations of discontent at the legal fare, by mendacity and by various modes of extortion, to charge upon the public the expense of the wasted capital. Sometimes it is in the form of a piteous appeal, that the driver or the competitor has been out all day and has not before had 'one single blessed fare.' And yet the legal charge for the commonly wretched service of the man, horse, and vehicle is, when taken by the hour, nearly double, and by the mile nearly treble (when only two horses per diem are used) its actual prime cost, which, when driving, is at little more than six miles an hour, 2d. or 3d. per mile, and when waiting 1s. 4d. per hour. But there is now a cry from the cab proprietors that this charge of double the prime cost does not pay, as it probably does not under such a ruinous system. An appeal is proposed to Parliament for an augmentation of the fares; but such augmentations under this principle of competition within the field would only aggravate the evil, for it would lead to an increased number of competitors, and instead of there being a competition of three to do the work of two, there would be a competition of two or more to do the work of one—i.e., a greater waste of capital to be paid for by some one.

"Since the reduction of the fares in 1852 the number of cabs in the metropolis, instead of being reduced, has been increased from 3,297 to 4,507 in 1857.

"If there were no legislative restraints, the extortion under the system of competition within the field would reach such a height as to go far to extinguish the service altogether, or confine it to cases of extreme necessity and very large means of payment. My friend Mr. Henry Ashworth, of Bolton, in an account of his travels in America, gives an illustration of this state of things. Speaking of New York, he says—"They have their coach-stands—coaches with two horses each, such as we formerly kept on hire, and the fares appear to be discretionary, or according to bargain. Upon a rainy day the sum of two dollars, or 8s. 4d., was demanded as the fare for half-an-hour. I offered one-half the sum, and it was declined. I then pointed the attention of the driver to the string of 20 other carriages, all waiting to be employed, and remarked upon the uncertainty of his making any money at all within the next half-hour. He very coolly replied, 'The rain is falling very fast, and I guess

I'll spec it.' He preferred to speculate upon the chances of might offer, and so I left him."

"Examples of perfectly unrestricted competitions within the field are presented amongst the boatmen on the coast, when a brisk traveller hurries from London, and presents himself to half a dozen, or a dozen, say, of Deal boatmen, to be put on board a vessel, or out of hall and on the point of starting. They see that unless the 'fare' is put on board he will lose his passage-money and his voyage, and instances have occurred where not one boat was to be hired for less than five pounds or more, to put him on board, or perform service for which, at the rate of wages of men in regular employment of the class of the boatmen, as many shillings would be most likely not to say exorbitant remuneration. At Liverpool, where emigrant passengers are frequently belated, ships being delayed so long beyond their time that it is believed they will not start for days when they suddenly do start, and a passenger on shore who has his wife and children on board, sees the ship turning past the rock, then the boatman's charges have arisen to such a height as to bring the competition steam-tugs, as being more economical as well as more certain.

"The execution of the laws for the regulation of the ferry-boatmen having been relaxed or fallen into desuetude, the charges of the watermen have so augmented beyond the legal rate as almost to extinguish the habitual use of boats on those parts of the River Thames little occupied by steam-boats or the larger craft, and by conveyance by boats would be convenient or pleasurable, and the charges were reasonable.

"At Richmond the boatmen require 2s. and 2s. 6d. per hour (sometimes, however, accepting 1s. 6d. for the second hour), which, at the work of ten or twelve hours, would give a remuneration of 15s. or 18s. per diem to labourers of a class to whom 5s. or 6s. would be regular employment, be high wages. Double and treble the fares do not, however, satisfy the competitors, who charge their anxieties and discontents, as well as their losses, upon the public, with all these extortions upon the public the condition of the engaged in such service is a wretched one. In the conflict of men for the service of two, or of two for the service of one, the social feelings of the most malignant character are engendered, and in the necessity under which such people consider themselves to be placed of compensating themselves for the waste of their time, the risks of the competition, feelings are maintained of what I have characterised as a wolfish rapacity, to prey upon the necessities of all of the public who are exposed to them.

"In respect to this service of cabs—the analysed charges and statistics show that by a properly-conducted competition by adapted capital for the whole field—for which, in my view, the chief point is local administrative authorities ought, as servants of the public, to be made responsible—service equal to the present might be obtained at 4d. per mile; or at the present legal fare of 6d. per mile, a service approaching in condition to that of private carriages might be insured out of the mere waste which now occurs. Machines have been invented, which are stated to be convenient and not expensive, which, I am assured, measure time and distance, and determine for the passenger the fare to be paid, and register the earnings due to the proprietors. Under a system of competition for the field, such securities might be introduced. Isolated attempts to introduce such machinery into cabs have hitherto, even in Paris, been uniformly defeated by conspiracies of the whole body of the drivers. The machinery has been maliciously broken or spoiled by the drivers of other vehicles than those in which it was introduced. The various elements involved in the question, which may be referred to the moralist, who will agree that the waste commonly involves suffering, malignity, demoralisation, as well as suffering. In this instance, the suffering is extended to the animals who minister to our convenience. The cab horses are driven mercilessly, and then returned beaten to their stand, there to remain for hours exposed to cold and wet, and indeed they often have only variations of suffering when taken to the foul, confined stables of the small owners, which I well know are the seats of disease, and commonly the inhabitants of the mews, the first victims of the outburst of epidemics. The wretched existence of the cab horses is soon worn out. The lodgings of the men are commonly of a piece with those of their horses. It is a deep conviction, from observation, that whilst waste is suffered, by the infliction of animal as well as human suffering, is wasted. Hence economical science will be found to be a more powerful aid to beneficence than is commonly supposed. Mr. Bianconi, the great manager of horses in Ireland, received much applause from religious communities for only permitting those animals under his charge to work six days, that they might rest on the seventh day, but at our section of economic science, at the meeting of the British Association held at Dublin, he frankly disclaimed any other motive than his own interest, which was answered by a saving from the improved practice of 11 per cent. of his outlay for horses. My friend Mr. Whitworth, who has paid much attention to horses, declares that it is more economical to use up two light vehicles (as gigs) and one horse, than two horses and one vehicle. There can be no doubt that good, well-ventilated, and warm stabling for the horses, and better shelter and care during the day, would be economical of capital, as good sanitary dwellings would be to the men. Besides the economical, there are æsthetic considerations connected with this branch of administration; for until the people, high as well as low, have become less apathetic to the constant spectacle in the streets of animal decrepitude and suffering, as well as of human squalor, filth, and wretchedness—until they have become impatient of them, and insisted upon their prevention, and upon having in their stead spectacles of wholesome, painless, and pleasant life and action, they are not in a proper state of mind for the reception of due impressions of the beautiful, or of external decorations which the votaries of bi

improved æsthetical and economical conditions, large capital, as well as a more intelligent and superior public administration, is requisite. On a competition for a large field under the guidance of such an administration, I should expect that the public thoroughfares would be cleared of the cab stands, and the spectacle of the continued waiting of men and horses during inclement weather prevented, and that this would be done by the practice as respects the *voitures de remise*, which prevails in Paris, where in some of the streets only the head of one horse appears from a doorway to a shelter under which it stands ready harnessed, whilst others are in proper stables behind, ready to be harnessed as fast as the demand arises. The considerations of the traffic of a populous district, and of the condition of those engaged in it, would render it desirable to encourage locomotion by steam and the use of tramways through the streets. But judging from experience in Paris and elsewhere, there appears to be no probability of much diminution of the demand for horse-power for the minor traffic of conveyance in populous districts.

"There are large elementary distinctions, which I will mention here, of which I must avail myself on some other opportunity of displaying fully, between charges and payments as for services, and charges on and payments proportioned to the pressure of necessities. Payments as for service imply responsibilities to render that service in a proper manner, and those responsibilities are best brought about, as I may show more fully, by the principle of competition for the field; whilst charges made on necessities, and on estimates of the pressures and means of paying them, are sustained by monopolies, which are incident, and almost essential to the practice of what is called free competition within the field of service. In the case of the New York hackney coachman mentioned by Mr. Ashworth, the coachman, by the agreement with his fellows on the stand, had virtually an irresponsible monopoly of the service, giving him the power to exact payment according to his estimate of the travellers' necessities and means. In the case of a water supply, the actual cost of water for the supply of a water closet would be 6d. per annum if paid for as a service; but as a charge upon necessities or convenience, the companies levy 10s. each per annum, which forms a serious obstruction to the sanitary improvement of towns. And so with the Deal boatmen; and the character of the monopoly is similar, whether it be by the three cabs or the three omnibuses, to do what, under competition for the field, might be the service of conveyance of passengers by two;—or by two or three competing lines of railway, to perform a service which might be more responsibly rendered by one,—or by the seven originally competing establishments for the distribution of water, a service which might be best rendered by one on either side of the river, if not by one for the entire field. The results in these and other branches of service are common efforts and almost common necessities to charge the waste of capital upon the public, to create virtual multimono monopolies, and to impose, for the bad service, high charges exacted on private necessities."

I am, &c., EDWIN CHADWICK.

THE CAB QUESTION.—SIR,—The point that I adverted to in discussing the subject of the present legal cab fares, and their effect in rendering those vehicles of inferior character, has, I find, been misstated in the report of that discussion, given in the Society's *Journal*, where it is stated that I thought "the taxation imposed on cabs was, to a certain extent, compensated by the privilege of standing for hire in public places." Now, it was not the "taxation" on cabs that I referred to in my remarks, but the question of free-trade as bearing on a system of compulsory legal maximum of cab fares; I mentioned that question as being to some extent affected by the fact of cabs possessing the peculiar advantage above stated; but as, owing to the late period of the discussion, I did little more than hint at the point I wished to bring forward, I would now put it more explicitly. Although I quite agree with Mr. Cole that, as a matter of principle, the price of the hire of a cab should be left to be settled between the hirer and the person letting to hire, yet I fear that in practice the leaving this to be arranged between the individuals concerned, without any legal restriction, would be productive of great confusion and litigation; therefore it would seem desirable to consider whether there are not peculiar circumstances attending the matter sufficient to make cab-hiring an exceptional case; these are, that licensed cabs have accorded to them, by public authority, the exclusive right or privilege of standing for hire at certain appointed places in the public streets, and likewise the right of enforcing payment of the fares by a summary process before a criminal judge, which are things not incidental to matters of trade in general; hence it does not seem unjustifiable that these peculiar privileges or advantages should be allowed upon a condition or special public stipulation that the maximum amount of fare should be fixed by the licensing authority—in fact, it is a licence granted on certain

conditions. That a compulsory arrangement should enable people to ride in cabs for so small a sum as sixpence is, to my mind, considering all the facts of the case, anything but fair treatment of cabby, and on this point of insufficiency of the amounts at which the fares are fixed seems to hinge the whole question of supply of good or bad cabs, for it is evident the present scale of remuneration is too low to induce capital to enter this field of enterprise. Hence the want of wholesome competition, and the consequent bad condition of the cabs; though, as Mr. Webber remarked, the perils of our crowded streets have possibly something to do with the state of these vehicles, and probably some arrangement for sheltering cab-stands would do something to help us to better cabs. A further point as regards this question of free-trade and cab-fares is, that there does not appear to be any legal obstruction to competition with the cabs in the form of the *Remise* cabs, such as are in vogue in Paris, because there seems to be no law to prohibit such vehicles from being stationed at standings provided by a company or private enterprisers, so long as the riders engage the vehicles at these standings, and not in the public streets. Whether this would be a paying speculation I cannot say, but there seems to be no law to prevent its being tried. I cannot conclude this communication without saying that Mr. Cole appears to me to have deserved the warmest thanks of every one for the able and impartial manner in which he treated the subject.—I am, &c., F. W. CAMPIN.

Journal of the Society of Arts.

FRIDAY, FEBRUARY 22, 1867.

Announcements by the Council.

ORDINARY MEETINGS.

Wednesday Evenings at Eight o'Clock:—

FEBRUARY 27.—“On the Economy of Telegraphy as part of a Public System of Postal Communication.” By EDWIN CHADWICK, Esq., C.B. On this evening SAMUEL R. GRAVES, Esq., M.P., will preside.

MARCH 6.—The following subject for Discussion will be introduced by Mr. CHRISTOPHER COOKE:—“On Storm Signals and Forecasts, their utility and public importance with respect to Navigation and Commerce.”

CANTOR LECTURES.

The concluding Lecture of the course “On Pottery and Porcelain,” illustrated by specimens of various manufactures, will be delivered by William Chaffers, Esq., as follows:—

LECTURE VI.—MONDAY, FEBRUARY 25.

ENGLISH POTTERY AND PORCELAIN.—Early History, continued to the beginning of the 19th century.

A Course of Lectures “On Music and Musical Instruments,” by JOHN HULLAH, Esq., will be delivered as follows:—

LECTURE I.—MONDAY, MARCH 4.

HARMONY.—Introduction—Greek Music—Mediæval Musical Science—Acoustics—Musical Sound—Vibration—Pitch—Harmonies—Resultant Sounds—Consonance and Dissonance—Tonality.

LECTURE II.—MONDAY, MARCH 11.

MELODY.—Musical System—Tonality, Ancient and Modern—The Subdominant and Leading Note—Melodies in Imperfect Scales and in Ancient Modes.

LECTURE III.—MONDAY, MARCH 18.

MUSICAL EXPRESSION.—Definition—Difficulties of Musical Composition—Realization of Unheard Effects—The Perfect Cadence—The Renaissance—Imitation—Expression, False and True.

LECTURE IV.—MONDAY, MARCH 25.

MUSICAL NOTATION.—Different Systems, Alphabetical and Special—Neumas—Accents—Lines and Spaces—The Time Table—Modern Notation; its Origin and Growth, Simplicity and Fitness.

LECTURE V.—MONDAY, APRIL 1.

MUSICAL INSTRUMENTS.—Classification—Wind Instruments—Stringed Instruments—The Plectrum, Hammer, and Bow—Instruments of the Ancients—Mediæval Instruments; their Introduction into the Church.

LECTURE VI.—MONDAY, APRIL 8.

MUSICAL INSTRUMENTS (continued).—Modern Instruments—Chamber and Orchestral—Combination—The Modern Orchestra—Conclusion.

The lectures commence each evening at eight o'clock, and are open to members, each of whom has the privilege of introducing one friend to each lecture.

ART-WORKMANSHIP COMPETITION.

The works sent in competition for these Prizes are now placed in the Society's Great Room for the inspection of members and their friends.

EXAMINATIONS, 1867.

In addition to the prizes announced in the Programme of Examinations, the following are offered:—

The Worshipful Company of Coach and Coach Harness Makers offer a prize of £3 in Freehand Drawing, and a prize of £2 in Practical Mechanics, to the candidates who, being employed in the coachmaking trade, obtain the highest number of marks, with a certificate, in those subjects respectively.

The Worshipful Company of Goldsmiths offer three prizes—of £5, £3, and £2 respectively—to the three candidates who, being employed on works in the precious metals in any part of the United Kingdom, shall obtain from the examiners the first, second, and next highest number of marks, such prizes to be distinguished as the “Goldsmiths' Company's Prizes.”

INSTITUTIONS.

The following Institution has been received into Union since the last announcement:—

St. Thomas's (Woolwich) Evening Drawing Classes.

SUBSCRIPTIONS.

The Christmas subscriptions are due, and should be forwarded by cheque or Post-office order, crossed “Courtts and Co.,” and made payable to Mr. Samuel Thomas Davenport, Financial Officer.

Proceedings of the Society.

FOOD COMMITTEE.

The Sub-Committee on Meat met on Wednesday at 10.30. There were present—Mr. Benjamin Shaw (in the chair), Messrs. Harry Chester, Parish, C. S. Read, M.P., J. Ware, and E. Wilson. The meeting had before them a specimen of meat preserved in paraffine by Professor Redwood's process; two specimens of meat from Buenos Ayres, salted on Mr. Morgan's plan; specimens of Dr. Hassall's various preparations, flour of beef, meat cocoa, meat biscuits, &c.; *Extractum carnis* (Liebig) from South America, prepared by Liebig's Extract of Meat Company (Limited); from Australia, supplied by Messrs. Allen and Hanbury, Plough-court (Tooth's), Mr. Tindal, Mr. Hooper, Pall-mall, and also by Mr. Deane, of Olapham (two kinds), &c. The Committee proceeded to consider the best modes of testing, by experiments on a large scale, the nutritive

value of certain articles, and resolved to proceed with that part of their subject at their next meeting on Wednesday, the 27th inst.

The Sub-Committee on Milk and Fish met at 12 o'clock on the same day. There were present—Lord de L'Isle and Dudley (in the chair), Mr. Harry Chester, Lord Robert Montagu, M.P., Messrs. J. C. Morton, and J. Ludford White. The Committee resolved to seek, from the principal railways entering London, information relative to the supply and transit of milk; and Lord de L'Isle and Dudley and Mr. J. C. Morton undertook to procure information as to the system of cow-keeping as practised in the North of England and in Scotland, with regard to the supply of milk to the labouring classes.

CANTOR LECTURES.

"ON POTTERY AND PORCELAIN." By W. CHAFFERS, Esq.

LECTURE V.—MONDAY, FEB. 11.

European Pottery.

The lecture was illustrated by a large collection of choice examples of porcelain, and a label was affixed to each, stating when the manufactory was established and when it was discontinued, and diagrams of the marks were placed upon the wall. The lecturer commenced by explaining the properties of the porcelain of Europe, and the difference between the *pâte tendre* and *pâte dure*, or hard and soft paste, and the peculiar methods of painting upon the biscuit adopted by the artists. The first successful attempt in Europe to imitate porcelain was made at Florence, as early as 1580, under the auspices of Francesco I. de Medici, but it was not so hard as that of China; that is to say, composed of kaolin and petuntse, but a soft paste and translucent, which is one of the principal tests of porcelain. For some reason, the manufacture of this porcelain was abandoned after the death of the inventor. This Medici porcelain is now very scarce; there are not more than 30 pieces known. The mark found underneath these pieces represents the Cathedral at Florence painted in blue. The manufactory of Doccia was founded in 1735, by the Marquis Carlo Ginori, contemporaneously with the Imperial manufactory at Sèvres. About 1760 it rose to great importance, and large groups were executed from the models of the most celebrated sculptors. In 1821 the moulds of the Capo di Monte porcelain were transferred to Doccia. Venice was celebrated about the same time (1730) for porcelain, *soft paste*. There is in many of the pieces a great similarity between the decoration of Venice and Chelsea porcelain, and it has been supposed that workmen from Venice were employed at Chelsea; moreover, the mark of an anchor has been adopted by both. The manufactory at Madrid called "La Chine" was founded by Charles III. in the garden of his palace, called *El buen retiro*. It was organized by workmen he brought with him from Capo di Monte, and there is consequently a great resemblance between the products of the two fabriques, both being soft paste; the landscapes painted upon this ware are very artistic. The celebrated porcelain manufactory at Dresden, or rather at Meissen (in its vicinity), was established by Augustus II., Elector of Saxony, for the manufacture of true porcelain, that is, hard paste. The experiments of Tschirnhaus and Böttcher commenced about 1706, and to the latter is attributed the invention of hard paste. His first attempt was a red ware, like jasper, which was cut and polished by the lapidary, and ornamented by gilding; it was a fine stone-ware, having the opacity, grain, and toughness of pottery. In 1708 Tschirnhaus died, and, shortly after, Böttcher succeeded in discovering the mode of making

true porcelain by the accidental detection of the kaolin necessary for the purpose. Böttcher was born at Schleiz in Vogtland, in 1682, and died in 1719, at the early age of 37. He was sent by his father to Berlin to study alchemy, and was considered a great adept in the occult science, and was even supposed to have discovered the secret of the philosopher's stone. After remaining some time in the service of William I. of Prussia, he became annoyed at the insupportable surveillance to which he was subjected, and fled; but he was arrested in Saxony, and the Elector detained him as a state prisoner; partaking of the credulity of the age as to the possibility of discovering the philosopher's stone, he resolved to test the powers of Böttcher, and sent him to the fortress of Königstein; subsequently he was removed to the Castle of Albrechtsberg, at Dresden. While there he continued his experiments, not altogether in the attempt to make gold; but in discovering the means of making true porcelain, and was, by a fortunate chance, enabled to discover the secret. The story is thus told:—John Schnorr, a rich iron-master of the Erzgebirge, in the year 1711, riding on horseback at Aue, near Schneeberg, observed that his horse's feet stuck continually into a soft white clay, which impeded his progress. Hair-powder for wigs (made principally from wheat flour) was at that time in general use, and a careful examination of this earth suggested to Schnorr the substitution of it for the more expensive material, which was sold in large quantities at a cheap rate in Dresden, Leipzig, and other cities. Böttcher, among others, used it, but, finding it much heavier, desired to ascertain the deleterious ingredients, and analysed it, when, to his great astonishment, the ingenious chemist found in it the identical properties of the kaolin, which was the only thing required to complete his discovery of true porcelain. It was known to commerce as Schnorr's white earth of Aue, and was used secretly at the manufactory until the Aue kaolin was exhausted in 1850. In consequence of this important discovery, Augustus II. established the great manufactory at Meissen, of which Böttcher was appointed director in 1710, and about 1715 he succeeded in making a fine and perfect white porcelain. The first attempts to paint upon this ware were very imperfect, consisting of a blue colour under the glaze, in imitation of Nankin blue porcelain. It was under Horoldt's direction, in 1720, that paintings of a superior character, accompanied by gilding, and medallions of Chinese figures were introduced, and magnificent services completed. In 1731, Kändler, a sculptor, superintended the modelling of animals and groups, vases, &c., and other artists painted birds, insects, and copies of paintings principally of the Flemish school. From 1731 to 1756 the best productions emanated from the Dresden manufactory. Kändler modelled men and animals of the natural size, as well as peacocks, herons, pelicans, and other birds. Among the pieces produced about this time, by or under the direction of Kändler, at Meissen, was "The Tailor of Count Bruhl," mounted upon a goat, with all the implements of his trade about him. This vain man had a great desire that his likeness should be executed in porcelain at the royal manufactory, and his request was complied with, but not probably so as to gratify his vanity, for not only the tailor but his wife were thus immortalised, *aere perennius*, in porcelain. In 1754 Dietrich became director, and he was succeeded in 1796 by Marcolini, whose beautiful productions are well known. His period is always known by a star underneath the crossed swords. In spite of the precautions taken at Meissen to prevent the secret becoming known—the penalty being death, or perpetual imprisonment in the Castle of Königstein—some workmen escaped to reveal it elsewhere. Among these, a clever potter, named Stölzel, and a painter and gilder, Christopher Conrad Hüniger, went to Vienna, in 1717, and were engaged by Claude du Pasquier, who obtained a privilege for 25 years. In 1744 it was purchased by Maria Theresa, and this was the period of its greatest pro-

perity. In 1785 there were 35 furnaces, employing more than 500 persons. This latter period is remarkable for the application in relief of solid gold platines exquisitely figured, and historical subjects, flowers, &c., finely painted. The mark used from 1744 to the present time is a shield of the arms of Austria. At a later period, 1751, William Gaspard Wegeley established a manufactory of porcelain at Berlin. It was carried on for eight years, but never remunerated the originator, probably for want of the requisite funds, and he abandoned it in 1761, but Gottskowski, a celebrated banker, became the purchaser, and, aided by his capital, it was brought to a flourishing state. Two years after, Frederick the Great bought the works, and it became a royal manufactory. Not content with ruining the Dresden *fabrique*, he expatriated many of the best workmen and painters to assist his own manufactory at Berlin, and transported not only the clay, but a great portion of the collection. Independently of this, and the better to insure employment for his 500 workmen, he restricted the Jews resident in any part of his dominions from entering into the marriage state until each man had obtained a certificate that he had purchased porcelain to a given amount. Höchst was early in the field as a competitor with Meissen in the manufacture of hard porcelain. A potter, named Ringler, who had escaped from Vienna, assisted in its formation, with Gelz, a fayence maker of Frankfort. About 1740, under the Elector John Frederick Charles, Archbishop of Mayence, the factory rose to great importance; and under Melchior, a celebrated modeller, from 1760 to 1785, the statuettes produced ranked among the first in Germany. The manufactory of porcelain at Frankenthal was established in 1754, by Paul Hanüing, who, having discovered the secret of hard porcelain, offered it to the royal manufactory at Sèvres, but not agreeing as to the price, the offer was declined, and they commenced persecuting him—for in that year a decree forbade the making of translucent ware in France except at Sèvres—and Hanüing was compelled to go to Frankenthal, leaving his fayence manufactory at Strasbourg in charge of his sons. In 1761 it was purchased by the Elector Charles Theodore, and it attained great celebrity. The Nymphenburg manufactory, near Munich, was established by Ringler, about 1758, and became a royal establishment shortly after. On the death of Carl Theodore, the Frankenthal works were transferred to Nymphenburg, and are still carried on successfully. The manufactories of porcelain at Furstenberg, Kronenberg, Fulda, Thuringia, Holland, and Russia, were next described, and, in speaking of those of France, the lecturer said the most celebrated for its early productions is St. Cloud. The china was altogether different from that of Dresden, being of soft paste, was established in 1695, and it may be considered the parent of all the porcelain manufactories in France. In 1702 letters patent were granted to the family of Chicanneau, which in 1712 were renewed, and M. Trou having married Chicanneau's widow, it was carried on in his name. In 1722 Trou's sons obtained a further grant, which was renewed in 1742 for twenty years more. Thus, the manufactory at St. Cloud being in active operation for upwards of 40 years, its products are by no means rare. They are easily known by their peculiar creamy glaze, and are frequently of an overlapping leaf pattern, called the "quilted china of St. Cloud," or painted in blue with a sort of arabesque border. The history of the celebrated manufactory at Sèvres must be traced back to that of St. Cloud, which, we have seen, was founded as early as 1695. Here Louis XIV. accorded his patronage and favour by granting exclusive privileges. In 1735 the secret of the manufacture was carried, by some of the workmen, to Chantilly, and for a time continued there by the brothers Dubois. They left in a few years, taking with them their secret, and settled at Vincennes, where a laboratory was granted them, but after three years they were dismissed. In

1745 a sculptor, named Charles Adam, formed a company, and the scheme was approved of by the king, privileges being accorded them for thirty years, and a place granted for their works in the Chateau de Vincennes. In 1753 the privilege of Charles Adam was purchased by Eloy Brichard, and Louis the Fifteenth took a third share—hence it became a royal establishment. Madame de Pompadour greatly encouraged the ceramic art, and it arrived at great perfection. The buildings were found too small to meet the increasing demands for their beautiful productions, and in 1756 they removed to a large edifice at Sèvres, built expressly for the company. The Vincennes porcelain is now much esteemed; a favourite decoration was flowers and birds, on a beautiful *bleu de Roi* ground, and cupids painted in camaieu of a single colour. The mark at first was the double L, without any letter denoting the date, and after 1753 (when the dating commenced) the letters A B and C are found enclosed within the cipher, after which it merges into the Sèvres category. In 1760 the king became sole proprietor, and M. Boileau was appointed director. By a decree of council, made in this year, Sèvres had the exclusive privilege of making porcelain, plain or painted, gilt or ungilt, ornaments in relief, sculpture, flowers or figures. Certain *fabriques* which had already privileges granted them, were allowed to continue their works of white porcelain painted in blue, with Chinese patterns only; the employment of any other colour, especially gilding, and making figures and flowers was strictly prohibited. Even the makers of fayence were prohibited using coloured grounds in medallions or otherwise, or gilding. About 1761 the secret of making hard porcelain was purchased of Pierre Antoine, the son and successor of Paul Hanüing, for an annuity of 3,000 livres (£120), and the manufacture of the *pâte tendre* being expensive, and liable to accidents in the furnace, it was deemed important to substitute hard paste. Although possessed of the secret they had not the means of producing it, being unable to procure the kaolin necessary, until accident led to the discovery of some quarries yielding it in abundance at St. Yrieix, near Limoges. In 1769, after Macquer had brought the ware to perfection, the manufacture was successfully established at Sèvres, and both descriptions of china continued to be made until 1804, when, Brogniart being director, soft paste was altogether discontinued, and declared to be "useless in art, of expensive manipulation, dangerous to the workmen, subject to great risk in the furnace, &c." In conclusion, the various porcelain manufactories of hard and soft paste in France were reviewed, and their peculiarities pointed out.

ELEVENTH ORDINARY MEETING.

Wednesday, February 20th, 1867; Lord ROBERT MONTAGU, M.P., in the chair.

The following candidates were proposed for election as members of the Society:—

Busbridge, Walter, 4, Chester-place, Plumstead, S.E.
Guise, Francis Edward, 2, Middle Temple-lane, E.C.
Ingall, Charles, Mollish's Wharf, Limehouse-end, Mill-wall, E.
Johnson, John Robert, 31, Red Lion-square, W.C.
Keating, Lorenzo, 231, New-cross-road, S.E.
Kernaghan, B., 70, Bishopsgate-street Within, E.C.
Oliver, Thomas, 66½, Northumberland-street, Newcastle-on-Tyne.

The following candidates were balloted for, and duly elected members of the Society:—

Hawley, J. P., C.E., Lambeth Water Works, Brixton-hill, S.
Hewitt, F. K., London Joint Stock Bank, 124, Chancery-lane, W.C.

Howse, Thomas, 19, St. Paul's Church-yard, E.C.
Schofield, William W., Buckley Hall, Rochdale.
Stirling, Sir Walter, Bart, 36, Portman-square, W.

The Paper read was—

THE WATER SUPPLY OF LONDON, AS IT AFFECTS THE INTERESTS OF CONSUMERS.

By THOMAS BRIGGS, Esq.

At the present time there are two questions engaging the attention of thoughtful and practical men, kindred in their nature, and together lying at the root of all sanitary improvement. The one is, how to bring an abundance of pure, soft water to our towns and populous villages; and the other, how to utilize the refuse. To the first of these my observations on this evening will apply. I do not presume to offer anything new upon a subject which has been so much discussed for the last twenty years. In fact, I believe that nothing new can be said upon it; but I indulge the hope that I may be able to place some of the facts and arguments which have been adduced in favour of a constant supply of water for London, in such a connexion as will, in some slight degree, assist the inquiry which is now before the recently-appointed Commission. I propose to treat the question from that point of view, regarding myself for the time being as a consumer of water.

It would be a waste of time to enlarge upon the gravity and importance of the subject. Recent events have again forced upon our attention the necessity of an improved water supply for the metropolis, but the statements as to the privations and sufferings of the poorer classes under the present imperfect system are only repetitions of those made by competent medical authorities before the Commission which made its report in 1844. So that for nearly a quarter of a century the condition of our people has been appealing against us. For that period no material change for the better has been made in their general condition. We are again awakened to the knowledge that there are in the metropolis entire districts almost shut off from the blessings and amenities of our civilisation, and only occasionally we obtain a glimpse of the destitute circumstances of the inhabitants when we are threatened by an epidemic. The habits, modes of subsistence, and the daily pursuits of these people, are as little known to our well-to-do classes as if they were the denizens of another hemisphere. When an invasion of cholera is threatened we are stirred into activity. Inquiries are hurriedly made, and we are startled at the presence of so much misery. Stimulated by the mingled feelings of pity and alarm, we organize committees, and make a liberal distribution of soup, blankets, and bread. We scatter our charities at the time with a profuse hand, and exhaust the resources at our command in measures of treatment. When the danger has passed away we relapse into our old habits of indifference. If the promises made in the hour of peril are remembered, we soon learn to dismiss them as troublesome, or find excuses for postponing or neglecting their fulfilment. We do not seem to profit by the reflection that, if all the means which are suddenly called into employment when an epidemic is at our doors, had been judiciously and leisurely employed in measures of prevention, we might very likely have escaped the visitation. It is always a serious evil to deal out large benefactions. They doubtless relieve the suffering of the moment, but they sow the seeds of future mischief, very often breaking down the independence of the labourer, and initiating his children into habits of vagrancy and mendicancy. We have other monitors besides those which reach us on the wings of the pestilence, and which admonish us as to the danger of permitting in our very midst the existence and growth of a large vicious and neglected class, who look upon the law as their enemy or oppressor, and upon the property of the industrious as their legitimate prey. Apart from all moral obligations,

we have the strongest economical reasons for diminishing the numbers of the pauper and indigent classes, for they bring upon the community an inexorable tax, more heavy than any other tax levied for the maintenance of the state. Let us hope that the lesson lately taught to us will not be so utterly disregarded as many of those which have been taught to the nation in years gone by, and that we shall, in right good earnest, set about works of permanent and substantial improvement, amongst which stands in the foremost rank a constant supply of water.

In entering upon such an inquiry, it is necessary to guard against errors of inference, and especially against those exaggerated statements which obtain currency in periods of panic or excitement. As an example of such, I have seen comparisons made as to the mortality of different districts, ascribing the difference to the water supply. Nothing can be more fallacious than such comparisons. The higher death-rate in some districts over others is not due to one but to a variety of causes. If an abundant supply of pure water were given to the inhabitants of Bethnal-green, there would still be a higher mortality than in many of the West-end parishes, and this would arise from overcrowding and other causes known to prevail in densely-populated districts. A vitiated atmosphere is quite as potent an agent in the generation of disease as impure water. It is sufficient for our purpose that the supply of water to the metropolis is, under the present system, insufficient for all the reasonable requirements of the population. Without a good supply of water public and private cleanliness is impossible. Water in reasonable abundance is, in fact, essential to health, comfort, and decency. Under a scanty supply the poorer classes suffer the most, and they are the most helpless in preferring appeals for redress. When we condemn them for slatternly and uncleanly habits, we ought in justice to compare their condition with our own. If a woman, the mother of a family, has to descend from an upper floor—from what is probably the living and sleeping room of herself, husband, and family—to a court-yard for all the water she has to use, the result will be great economy in the use of it, and that will soon affect all her other habits. This is unfortunately the condition of thousands in London, and under such circumstances it would be a marvel if the poorer classes were other than they are. We cannot say that they are placed in a fair position until a supply of water, sufficient for all reasonable purposes, is placed, if not in every room which forms a human habitation, at least on the floor of each house divided into separate tenements, so that the tenants may obtain water for domestic use without ascending or descending stairs to fetch it, or to convey away the water which has been used. I cannot but feel that there will be dereliction of duty on the part of every member of a vestry or district board, and indeed of every ratepayer, who allows this question to slumber, and who does not assist in the agitation for an improved water supply.

But there are other reasons for demanding an improved supply of water—namely, on the ground of its requirements for public purposes. I will take the case of fires. There is no place in the empire where it is of greater importance to possess an efficient machinery in the case of fires, and yet London is behind many second and third-rate towns in this respect. The increase in number of large edifices for public purposes, as well as of warehouses and manufactories, makes it imperative that the best mode of extinguishing fires should be adopted. In the metropolitan district there is an area of about 400 square miles, and there are nearly 600,000 houses. The increase of the value in property is even greater in proportion than the increase of population. The rateable value of property in 1862 was about £12,500,000; but in 1866 it had risen to £14,600,000. The total number of fires in 1866 was 1,338, of which 326 resulted in serious damage and 1,012 in slight damage. These figures show the importance of the question. The present r

The fire brigade

is under the management of a central office in Watling-street, and there are branch offices in all the principal parts of London. At all these branches a staff of men is ready night and day, and an engine can be despatched from any of these offices in less than five minutes. I believe the average time is two and a-half minutes. The discipline is excellent, and all the appointments are in the most perfect order. The communications from office to office are made by telegraph. It is a proof of the steadiness of the men, that although the engines proceed at a gallop, a stoppage or accident in the streets is very rare. When the engine arrives at the scene of the fire, one of the wooden plugs—the precise positions of which are indicated by tablets fixed on adjacent walls or buildings—is drawn from the main, and a portable cistern, made of flexible material, and which is carried on the engine, is filled from it and kept charged, and from this the pump of the engine is supplied so long as its services may be required. The expedition with which these engines are started, conveyed to their destination, and prepared for active work, is a matter of astonishment to all who witness the operation for the first time. The men employed in the management of the engines and the distributing apparatus, and, in fact, all concerned, display such cool intrepidity and disregard of personal danger as to win general admiration. They display, in fact, the same high qualities—the firmness, steadiness, and resolution—which have always distinguished our soldiers and sailors wherever duty called them to go. All has been done for this service that skill and discipline can accomplish, and the whole arrangement reflects the highest credit upon the late Mr. Braidwood, and his successor, Captain Shaw, under whom the brigade has been brought to its present state of efficiency.

There is, however, an inherent defect in the system for which the brigade service is in no way responsible. It is inevitable that a loss of time that is of the greatest possible consequence in cases of fire must ensue. In Manchester, a hose and jet can be attached to a fire-cock and the water brought to bear upon the fire in about the time that is required to start a fire-engine from one of the London stations, that is:—the connexion of a hose and jet to the fire-plug does not take on the average more than two minutes. The value of the fire-cock system is demonstrated at once. I have not been able to ascertain the average amount of time that elapses in London between the first discovery and the water being brought to bear on a fire, but if the average be taken at half-an-hour, which is certainly rather under than over, then that half-hour is clearly lost; and in that space of time the Surrey Theatre was burnt down. From the extent which the fire in that particular case had progressed, and the rapidity with which the flames spread, it may be presumed that no human exertion could have saved any portion of the interior had water been supplied at the moment of discovery; but this was an exceptional case, and there have been instances in London where if water could have been brought to bear with the promptitude that is practicable in the towns where a system of fire-cocks is adopted, the fire would not have left the apartment in which it originated; and yet the time required to bring the engine and fit it for use has been sufficient to give the flames such an ascendancy as to defeat all efforts to subdue them. The saving in time of the difference between two and a-half minutes and half-an-hour would be often sufficient to arrest a fire that ends in a total wreck. There is a period in the history of every fire when a bucket of water properly applied would extinguish it, and every moment is of the utmost value. It perhaps cannot be made matter of accurate calculation, but I believe one-half of the property lost by fires in London might be saved if a system of fire-cocks were introduced. I have that for the last twenty years no water works light have been carried out in any part of the kingdom where the same have not been introduced as a part of the arrangements of supply. One of the best precautions

is that of the proprietors of large establishments placing fire-cocks on their own premises. This arrangement is practicable, and is often carried out under the present system, but a constant supply would give greater facilities to private proprietors. There are other public purposes, the efficiency of which depend upon a constant supply of water, and on which space will not allow me to enter.

The superiority of a constant supply being acknowledged, the question will at once occur, why the Metropolis should not be supplied on a system that works so well in Nottingham, Norwich, or Wolverhampton. If it be applicable to a town of 50,000 inhabitants, why not to London with its 3,000,000. Mr. Bateman informs us that he has carried out the constant supply system in about 25 towns besides those in which he has been engaged as consulting engineer—towns with a population of from 7,000 to 600,000 persons, and a gross population of 2,000,000; and Mr. Hawksley, who was one of the first to carry out and enforce the advantages of a constant supply, has carried it out in about an equal number of places. Mr. Rawlinson has also carried it out in all the towns for which he was engineer. In all about 150 towns in Great Britain are enjoying the benefits of a constant water supply. Then why not London? It is said that a constant, which means an unlimited supply of water, could not be sustained from the excessive waste that would ensue, and that all the available resources at command would be exhausted under a waste going on night and day. This has been said in relation to every town, when a constant supply has been proposed. But I have partly answered that by showing the number of towns where the constant supply has been carried out, and it can be further answered by showing that the waste has been much less in the towns where a constant supply has been introduced than in those where an intermittent system prevails. In Nottingham, where Mr. Hawksley first introduced the system of constant supply, and where it is still retained, the consumption has been reduced to 14 gallons per head per day; and in Derby, under the same engineer, it is only 17 gallons. In Norwich I believe the quantity has been reduced to 12 gallons. Mr. Bateman informs us that the quantity used in the manufacturing towns of Yorkshire and Lancashire averages from 16 to 21 gallons per day. This is the general testimony, and the reduced consumption is easily explained. A constant supply necessitates the adoption of successful checks against waste and vigilant supervision, and I can see no reason why, with the same provisions, and under the same conditions, the consumption should not be reduced in London to the average of the manufacturing towns of Lancashire. If the difficulties are met with proper appliances and with determination, they will disappear as they have done in other cases. So far as quantity is concerned we have at present sufficient, if it be properly economised, to supply the requirements of London.

The subject is, however, generally argued as if the supply of London was insufficient in quantity and imperfect in quality. To remove these evils a number of schemes have been proposed, and upon each of them have been expended a large amount of time and no inconsiderable expense. Each of the schemes has its supporters, and the gentlemen who have prepared them are well able to expound and defend them. They propose to bring a supply of water sufficient to supersede all the present sources of supply; and these schemes come recommended to us as the proposals of men of high professional reputation. I will only name a few; and as my object is not to discuss the merits of any, I shall be pardoned for not naming all the schemes which, for the last twenty years, have been laid before the public. Mr. Homersham proposed to supply London from the neighbourhood of London itself, and a proposal was made for a company—the London Watford Spring-Water Company; and a Bill was prepared, and read for the first time in the House of Commons, on February 6, 1860.

Mr. Bateman proposes to supply us from a source 183 miles away—from the source of the Severn. Messrs. Hemans and Hassard take us a still greater distance, and propose a supply from Ullswater, a distance of 240 miles away; and Mr. Bailey Denton proposes to obtain a sufficient supply from the Thames watershed. Whether any or none of the plans are adopted, the discussion which must ensue will be of immense advantage in bringing every phase of the question before the great body of consumers. I will only plead for each of these plans to this extent—that the consideration of none of them should be dismissed on the grounds of distance or expense. This plea often prevails when works of utility are before us, and which involve a heavy first cost, but a more unwise economy could not be practised. I will take the plan which appears to be the most expensive—that of Messrs. Hemans and Hassard; and I believe that every intelligent person who has given attention to the subject will admit, that if it can be shown that we have not at present a sufficient supply of water in London, and that a supply cannot be got at a less distance than the lakes in Cumberland—and that it can be got there in sufficient quantity and purity, then that the £25,000,000 which is the amount they ask for the completion of the works, would be a wise expenditure, and that the interest of the money will be less in amount than the annual loss arising from an imperfect system of water supply. There is no doubt that we shall exercise due caution before we commit ourselves to so serious an outlay, but the heavy cost ought not to be put in the balance against the health and comfort of the community.

Now what are the real difficulties in the way of carrying out a system of constant supply for London? It is not for want of plans, nor of engineering and mechanical skill—nor yet for the lack of enterprise among our people, nor assuredly for the dearth of capital. Then where is it? In entering upon it, I must say that the question has always, as it appears to me, been discussed with much unfairness towards the existing water companies. They are spoken of as huge monopolies, standing in the way of all improvements, and making large profits out of one of the first necessities of life. I am almost ashamed to repeat some of the arguments which are in common use, but I am induced to do so, because reducing them to the simplest shape is really to answer them. It is objected by some that water is sent by a bountiful Providence, like air, in the greatest abundance, and that it should not be made an article of commerce, like coal or gas. They contend that the water costs nothing, and that it ought to be given to the people, under municipal arrangement, at a nominal price; and on the strength of such reasoning they would call upon the legislature to supersede the water companies, and establish some other machinery in their stead. In a commercial age, and among a commercial people, such arguments will weigh for nothing with those whose intelligence really influences and directs the legislation of the country, and the sooner they are dismissed from the minds of the consumers the better. The case of the water companies appears to be this—They were incorporated under a very different state of things to the present; when the style of living and ideas of comfort were altogether different; and when there were no municipalities having the disposition or the power to carry out any general schemes of water supply. If we go back even so far as the commencement of the present century, we must admit that the men who came forward to embark their capital upon works of public improvement were public benefactors, and the property they have created is entitled to the protection which the state affords to all kinds of accumulated corporate property. As to the profits made by the companies, they are not large, and scarcely such as would satisfy a large capitalist in any large undertaking. The weakest of all arguments is that which is founded upon the abundance and first cost of the article.

The water companies charge for the water, it is true, but the charge has to cover the cost of bringing the water from a distant source, where it is really of no commercial value, into the homes of the London public. The water-rate in fact covers the cost of whatever arrangements the companies may enter into to secure the original supplies, the canals by which it is brought into the field of consumption, the filtration, the pumping, the laying of large mains and service mains, the formation of reservoirs, and all other parts of the machinery of construction and maintenance. If for a moment we cease to call them water companies, and look upon them as water carriers, we shall then see more clearly what the revenues they receive have to cover. A gallon of water weighs ten pounds, so that a family of five persons, according to the average London consumption, which we may take at thirty-two gallons per head, have brought into the house, if the internal arrangements of the house are in perfect order, without any trouble, either as to the conveyance or as to the delivery, 1,600 lbs., or nearly three-quarters of a ton, or 320 lbs. weight for each person daily. It may be instructive to give a few simple calculations, so as to bring the matter more clearly to the mind. The 108,000,000 gallons brought into London daily would fill a lake 3,000 feet long, 34 feet broad, and 30 feet deep; or we will take it in another shape—it would fill a canal 10 miles long, 35 feet broad and 10 feet deep. The total weight would be nearly 500,000 tons.

As to the quality of the water, I do not wish to enter upon that inquiry, as the question can only be settled by scientific investigation, but I believe that an injustice is done to the London companies, by the condemnation of the water supplied by them, and in this way:—The water submitted to test has been, in many instances, taken from the service cocks after leaving a cistern, and assumed to be in the state in which it left the mains. If the water that is subjected to analysis be taken from the mains, then I think that it will bear a comparison with the water that is supplied to many towns where the constant supply system prevails. I have detected gross impurities in the water at hotels in Manchester, but the supply from the service might be pure for all that. Much of the impurity of the London water is attributable to the state of the cisterns and other receptacles for storage in common use. Many of the cisterns are old tubs and barrels, unfit for the purpose, to begin with, and rendered foul by long use without cleansing of any kind. Many of them are so fixed that they receive the drainage from roofs of outhouses, the rain water, and percolations from defective walls and gutters. Many of these, of a better construction, have an overflow pipe running into the soil-pipe of the water-closet. They are so placed in the majority of cases as to receive the emanations floating in the atmosphere. It is one thing to take water from one of these receptacles, and quite another to take it from a properly-constructed slate cistern, carefully protected from the admission of foul and deleterious matter from without. It is a powerful argument in favour of a constant supply, that it would necessitate a thorough revision of all the cisternage of London, and the removal of all cisterns which are unsuited to the purpose. While the present system continues it is not fair to blame the water companies for those defective arrangements, over which they have no control. I say this in fairness to the water companies. But I say, further, that if they are not able to give a constant supply, then it is clear that they must stand out of the way, and leave it to others to undertake the work; but if, as I believe, they have both the will and the ability, then it is incumbent upon us to consider how far the interests of the general public would be served by superseding them, and creating in their place some new and centralised authority. Of late years the London companies have given much attention to the subject of constant supply, and are now making diligent inquiries on the whole question. In many cases the companies are giving a constant sup-

ply, where satisfactory arrangements are made to guard against waste; and the language they employ is this:—"We will undertake to give a constant supply, to meet all the legitimate wants of London—if we can find security against ruinous waste."

I think the companies exaggerate this difficulty; but it is one of great magnitude, and one that must be carefully considered. There are facts enough to create dismay if they are looked at without the light that is thrown upon them by the experience of the provinces. I observe, in all the valuable papers that have been contributed on this subject, that a deficiency of quantity for the supply of London is in all cases assumed, and the present quantity is taken as the basis of all calculations of supply for the future. Now what are the facts? The quantity consumed in London is, as I have said, 108,000,000 gallons per day, which gives an average of 231 gallons per day to every one of the 470,000 houses supplied, and for its 3,000,000 of population 36 gallons per head for every man, woman, and child, or something more than double what is delivered under the constant supply system in many of our large manufacturing towns. Of this immense consumption it may be safely said that two-thirds are wasted, but if we take it at one-half, if we could reduce the consumption, by saving the waste, to 18 gallons a day per head, then we shall have an available daily surplus supply of 54,000,000 gallons to meet the wants of an increasing population, and the demand of those luxurious habits which always grow with the means of their gratification. I have been surprised that this view of the case has been so much overlooked. The poorer classes are not deprived of a sufficient quantity of water because there is not enough in our present resources, but because the whole of the community makes an improper use of that which it obtains. Their privations arise not from deficiency of quantity, but from waste. As I have said, I cannot see why the London public should use more than the public of Manchester, if proper precautions were taken against waste. Carelessness in the use of resources leads in this case, as in most others, to profusion, and the homely adage is verified that wilful waste makes woeful want. The worst of it is that the careful and the prudent have to suffer from the carelessness of the improvident.

This is the vital question—the one which includes the other questions involved in a water supply for London—and we shall be all the better for looking at it boldly. In London it is well-known that the negligence and dishonesty as to water fittings are most flagrant. For the sake of a copper ball or a brass service-cock, which may be sold for a few pence, they will be torn from their places, the other parts of the service seriously damaged, so that the water runs to waste, and so continues for days until detected by an officer of the company. An intelligent audience would scarcely give credit to a report, if such could be made, as to the extent of mischief of this kind. This is one cause of waste, but the greater cause of waste is the negligence of all classes of the population, and by no means the vice of the poorer classes alone. No value seems to be attached to water, and the utmost recklessness prevails. I have known instances, in towns where the constant supply system exists, of respectable persons, on the mere suspicion that a foul smell came up through the outlet of a wash basin, turn a tap and leave it on all night; and no doubt it was an aggregation of acts of culpable recklessness like this which created apprehensions in Mr. Bateman's mind as to the Glasgow Water Works, and induced him to represent to the corporation of that city, that if the consumption continued, which at one time had reached 47 gallons per head, the resources of Loch Katrine would fail to meet it. Nothing is more common than to find a stream of water running from a broken or defective ball-cock, or a service cock of a bad construction, or which is out of repair; that one cock wasting in the twenty-four hours more than is due to the fair consumption of a family. Very few persons have any idea of the amount

of water that may be wasted in this way, serving no useful purpose whatever. I will illustrate this by giving the results of actual experiments made by two independent persons besides myself. In each case a leaky cock was taken, when dropping only—such a cock as is usually placed over sinks—and it was found that such a dropping would consume half a gallon per hour, or twelve gallons per day, a larger quantity than is due to any adult person who does not use a bath. By dropping I mean such a series of drops as would not make a continuous stream.

This waste can be largely reduced by vigilant supervision and the introduction of superior mechanical water-waste contrivances. The habits of the poorer classes do not present an insuperable difficulty, for those habits may be overcome. The poorer classes are most unfairly used, and then the evils which arise from neglect are urged as reasons why no effort should be made to remove them. Look at the habitations into which the poorer classes are crowded, and the fittings which are left for their use. Cleanly and orderly habits are impossible, and a constant deterioration is going on. The introduction of better appliances must precede the proper use of them, and, as in all other cases that I am acquainted with, they will learn how to use and respect such improved appliances when given to them. It is disgraceful to retain the butts and water-closets which at present exist; and I believe that it would be attended with beneficial results if the water rate was in every instance levied upon the landlord, making him responsible for all defects of construction, all mal-arrangements, and all waste. For a great number of years the manufacturing skill of this country has been engaged in perfecting contrivances for the prevention of waste; and I speak with the greatest possible confidence when I say that I believe a constant supply of water in London is perfectly practicable, and that it might be brought about with a much less consumption of water than that which is now consumed. Improvements in habits, and consequently in morals, have always followed improved dwellings and improved sanitary arrangements, and this is the great encouragement to perseverance in a good work.

The next important question before us is that which affects the administration of an improved water supply. In whose hands are the powers of a new Act of Parliament to be lodged? This question might be set at rest by the present companies undertaking to give a constant supply, and I believe that they would be supported in any application made by them for extended powers to enforce restrictions upon waste. Their interests in this particular are identical with those of the consumers. They desire to prevent waste, as that diminishes their supply, and reduces the pressure, and produces irregularity and confusion in all their arrangements; and they desire also to get paid for all that is supplied. The consumers are interested in the prevention of waste, as they have to pay for that which is wasted as well as for that which is used. There ought really to be no antagonism between the supplier and the consumer of the water. If the companies find insuperable difficulties in providing for constant supply, then I think that the public will not be content with things as they are, and that Parliament will be called upon to pass some enactment that will enforce what is demanded; and then, as I have asked, in whose hands are the powers of administration to be lodged?

As it is impossible that in a matter of water supply there can be competition, the alternatives are very few. Competition has been tried, and the evils were found to be so great, arising from two different companies laying mains over the same district, and often in the same street, that neither Parliament nor the public would listen to any proposal to resume so objectionable a principle. Then there are three courses open to us:—The first, which finds favour in many quarters, is that of appointing a commission to govern the water supply; the second, is that of placing the government of such

supply in the hands of the Metropolitan Board, or whatever other central Board may be appointed under a new system of local government for the metropolis; and, the third, is that of leaving the water supply in the hands of the present companies, enforcing a constant supply, but giving them further powers to make provision against waste, and substituting another and a fairer principle of rating for that which is adopted at present. All these proposals I intend briefly to notice.

Those who support the supply of water being placed under the government of a commission, invariably take us to Paris, as an instance of what central authority can effect. I am willing to admit, having examined the system adopted in that city, that in some respects their arrangements work better than our own. In relation to their provision as to fires, they have in all their large buildings a preventive service; and such fires as those which ended in the destruction of the Covent Garden and Surrey Theatres, could not have occurred in any of the Paris theatres without the most criminal neglect. They provide, in fact, for each theatre a small fire brigade, of three or five men, as the circumstances of the case may require, whose duty it is to keep a vigilant watch night and day, to remove all rubbish and waste, and everything of a combustible character, to look after the gas, and, especially during the hours of performance, to keep watch upon the machinery and stage effects. These men have dormitories in the theatre, in which are fixed a number of alarms, so that in case of fire at any hour, they are advised by the men on watch as to the part of the theatre where their services may be required. They have wet blankets, mops, and all other apparatus provided and ready. At a moment's notice they can have water ready to pour upon the fire under pressure, by means of a cistern made on the principle known as that of the Hiero's Fountain. The whole arrangements are complete, and the discipline unexceptionable, and may be studied with the greatest possible advantage by the London community. In other respects, as to watering and cleansing roads, the plans in operation in Paris might be adopted in some of the suburbs, if not in the busy parts of London with advantage; and there is a profusion of water for all purposes of public display and luxury; but when we go among the homes of the people, we find all the defects so glaringly exhibited amongst our own population. Thousands of the Parisian population have no resource but a temporary stand-pipe, which is fixed for a short time in the morning of each day in the streets. The quantity of water supplied to Paris is about 50,000,000 gallons per day, so that the population being little more than half that of London, the number of gallons to each person is about the same in each case. The waste, as in the case of London, is enormous. I have myself seen from defective stand pipes and valves an amount of water running to waste in the streets of Paris sufficient for the supply of a whole district. Under the chief engineer, M. Belgrand, great improvements have been effected, and the citizens of Paris are largely indebted to his energy, skill, and perseverance. Commercially, however, I regard the system as a failure. It has under the present government acted upon the generous principle of providing water for the poor gratis, and the expenses are paid out of the city rates. We have recognised an analogous principle in London in our system of rating—that of making the richer pay for the poorer classes. As a rule, the adoption of all such unsound and uneconomical principles leads to grave errors in practice; and I am sure that it has done so in relation to the water supply for both London and Paris. The poor, as a class, are never benefited by such regulations. What severe pressure would be laid upon the poor man if he paid 4d. per 1,000 gallons (for that is really what the London companies receive for the water they supply) for all the water he used, and was relieved from a payment for that which his neighbour wastes? The quantity required for a workman's family could not be more than 25 gallons

per day. People seldom care for that which is given to them; and I believe the interests of the poorer classes will be best promoted by exacting payment in some shape or other for everything they consume. We must, in order to relieve the necessities of their condition, learn to give them justice rather than charity.

I do not admit that, as a whole, the administration of the water supply in Paris is better than our own, or that there is anything in it to attract us to a centralized government. If there were, we have to consider that institutions of foreign growth may not be congenial to our own country. There can be no greater mistake than to suppose that the institutions which succeed well in one nation may be copied by another. Institutions are not made; they grow; and everything depends upon the genius of the people among whom they are attempted to be founded. In this country we may enjoy an inconvenient amount of freedom, but we have become attached to that freedom; and, with all its grievous defects, local self-government has done much for us, and become a part of our national polity. It is well not to attempt violent changes when they interfere even with the treasured prejudices or attachments of a people. We have tried government by commission in this country, but without any success in any case. We had a short-lived Commission of Sewers in Greek-street, and subsequently we had a hastily improvised Board of Health. The latter, after a few years' desperate struggle for existence, came to an untimely and inglorious end. Let us be cautious, then, in promoting the creation of dominant bodies, who are not responsible to the public whose interests they are called upon to protect. There are undoubted evils connected with large trading companies, but they will be found less than those arising from centralized authority, as they are more easily grappled with and overcome.

The next plan suggested is that of vesting the control of the water supply in the present Metropolitan Board, or in any similar Board that may arise out of the reconstruction of the local government of the metropolis. The argument to sustain such a plan is that the water supply ought to be made a matter of municipal arrangement, the rates being debited with the expenses, and credited with the receipts from the water rates. We are taken to Manchester, the Corporation of which makes a profit out of the supply of water. The public are often misled on economical questions by looking at that which is seen, and not looking into that which is unseen. In this case we see the profit, but we do not see the various items on the other side, which would fairly constitute a *per contra* account, and make it questionable whether the Manchester people are really benefited by the arrangement. There are people of weight and intelligence in that city who contend that the arrangements as to water and gas are not quite so economical as they appear. It must also be said that there are places in the empire where the same arrangements as are now carried out in Manchester have been attempted, and have signally failed. In fact, it is worthy of grave consideration, whether it is not entirely without the province of a municipal government to enter upon any trading business whatever. As a rule this is never done well, is very expensive, and is open to this grave objection, that, unlike a commercial firm or company, a municipality rarely ever knows what business so conducted by them really costs, and it is liable to abuse from favouritism and sinister influences of all kinds. The argument is very plausible that a corporation ought to have the control of water, as so much of it is wanted for public purposes; but we have to inquire whether the public service is likely to be better supplied by a corporation becoming also a water company, or in its public capacity contracting with an existing water company. All experience will, I think, support the latter view.

Be that as it may—if we have conceded the principle, how are we to get it to London—where, with the exception of the Thames, we have nothing worthy of the name

of municipalities? No one will look at the Metropolitan Board as a permanent institution. From the manner in which it selected it is virtually an irresponsible body; and neither by its constitution nor its antecedents would it be recognised as a power in whose hands might be safely deposited the administration of the water supply. We have thirty-nine vestries and district boards—too many to secure efficiency and responsibility in the execution of public works. That is our first and greatest difficulty in the discussion of all public questions affecting the local government of the metropolis. What we require to put us in a fair position is an extension of the Municipal Act to the metropolis. Make every parliamentary borough into a corporation, elected in the same way, and for the same purposes as corporations in such towns as Birmingham and Bristol, with a central body for purposes of general government. If this were done, then I believe that they could more profitably contract with the water companies for the water wanted for all public purposes, than enter upon the supply of water under any centralized management; and such bodies, elected by the ratepayers, who are all of them consumers of water, would also be able to protect the interests of all classes, by seeing that the arrangements entered into for an efficient water supply are properly and fully carried out. If this were done, then I think that an Act of the Legislature, making it compulsory upon the water companies to give a constant supply, and reasonable powers to enforce prevention of waste, would be the most effectual way to the desired end. We are not talking now of what would be best in an entirely new community, where no machinery for water supply existed, but what will be the best under present circumstances, where large interests have arisen, and where a complication of arrangements exists.

I have very imperfectly glanced at the main bearings of a great question, the settlement of which cannot be much longer postponed. Such suggestions as I have made I offer most deferentially to this assembly, and to those who may afterwards read this paper. I am aware that the subject is surrounded by difficulties. Immense interests are involved, but the greatest is that which is made up of the convenience, comfort, and health of a teeming and struggling population. We have no excuse for neglect, for it can be shown as clearly as figures can demonstrate anything—that, besides its other imperfections, the present system of water supply is both extravagant and costly. Happily, the question is one that is not likely to attract a host of noisy agitators, but it is therefore the more incumbent upon the thoughtful and the prudent, those who have the power to influence public opinion, that they should take it up and press it to a successful solution; and I am glad to find that all parties are disposed to consider it in a calm and conciliatory spirit. We live in an age fruitful of professions and promises—but we must not forget the admonition that “words are the daughters of Earth, and things are the sons of Heaven.” Let us hope that the present opportunities will not be permitted to pass away unimproved. It is customary, in urging upon the community the importance of a water supply, to point to the works of the ancients—to their baths, aqueducts, and fountains. We have public works of other kinds which show that we have the ability to excel, both in design and execution, the boasted achievements of antiquity in all works of practical usefulness. We have the skill, the enterprise, the wealth—then why not employ it in this direction? In my judgment we can confer no greater boon upon the present age, nor lay any prouder claim to the gratitude of posterity, than by conveying to the houses of the poor and the toil-worn what Mr. Estlinman appropriately designates as an inestimable blessing—an abundant supply of pure water.

DISCUSSION.

Mr. A. C. HOMERSHAM said for the last twenty years

he had been obliged to give his attention, either in designing or constructing works or in attending Parliamentary committees, to the question of the water supply of London in the interests of the consumers. He was glad the paper before them had been brought forward in this public manner, because it would ensure the full and free discussion for which an opportunity was always afforded by this Society. This question had hitherto been too much treated by men in authority in private, without reference to the consumer, and too often by men who knew but little of the subject. He took exception to some of the statements put forward by Mr. Beggs. With regard to the question of constant supply, all who understood this subject would agree that constant supply was the right system, and there could be no doubt that sooner or later it would be adopted in the metropolis. But there were other matters connected with water supply which were even more important than this. Mr. Beggs had stated, with regard to the quality of the water, that “injustice had been done to the London companies by the condemnation of the water supplied by them,” which, in some instances, had been analysed “after leaving a cistern, and assumed to be in the state in which it left the mains.” He (Mr. Homersham) could only say that the bad quality of the water supplied by some companies had been evidenced by microscopic examinations by men of science, made for him (Mr. Homersham) on water taken direct from the mains, and by the death rates. He held in his hand the return of the Registrar-General, printed in the *Times* of 22nd August last, and, in remarking upon the mortality in the several districts of London during the prevalence of cholera, he wrote as follows:—

“We may now venture to look back and draw some deductions from the facts as they are recorded in the tables for the five weeks ending the 11th of August, during which 4,454 men, women, and children died of cholera and diarrhoea. The mortality in the five weeks has been at the rate of 37 per 1,000 living annually; but in both the South and West Districts, covered by 1,400,000 people, the mortality has scarcely exceeded the average by 1 per 1,000. The dense Central Districts are, some of them, such as St. Luke’s, remarkable for poverty; others, such as the City of London within the walls, for their wealth. The mortality by cholera was at the rate of 1 per 1,000 in St. Giles, 2 in the Strand, 0 in Holborn. There are seven districts in the East; the mortality by cholera in the poor district of Shoreditch was at the annual rate of 4, by cholera and diarrhoea 8 in 1,000; five of its sub-districts are supplied by the New River, one partially and one wholly by the East London, probably from Lea-bridges. In the rest of the East Districts the mortality by cholera was at very different rates: it was at the rate of 39 per 1,000 in Bethnal-green, 50 in Mile-end Old Town, 60 in St. George-in-the-East, 70 in Whitechapel, including deaths in the London Hospital from other eastern districts, 70 in Poplar and Bow, and 80 in Stepney. Bethnal-green is one of the poorest districts of London, if we may judge by the annual value of the houses; but the people of Bow and Poplar are not conspicuous for poverty. The whole of these districts, where the mortality from cholera was from 30 to 40 fold higher than it was either in the west or the central, in the north or the south of London, were supplied with water from the Old Ford reservoirs. London is divided into 37 districts: six districts are supplied from Old Ford, and everyone has been ravaged by the epidemic; the other 31 districts have for six weeks in succession suffered slightly. The 37 districts are subdivided into 135 sub-districts; 21 are supplied with the same water, and have all suffered six weeks in succession; 115 sub-districts have suffered considerably, except in St. Botolph and a few other districts, where the same water has crept in, and the mortality is partially swollen. By the doctrine of chances it is impossible that the coincidence between this particular water and the high mortality should be fortuitous, in 135 cases, during six weeks in succession. The induction extends over all the area of observation in previous epidemics, where sewage water has so often led to cholera outbreaks. . . . This great lesson should be taken to heart by every water company and every community in the kingdom. Unclean water cannot be consumed with impunity; its consumption is the sin of which cholera is the punishment.”

That was only one of a dozen similar documents which had been issued during the last five or six years by men of the highest authority. Mr. Simon, the medical officer of the Board of Health, had stated in this room the prejudicial effects which were produced upon the population of one of the southern districts of London, from the supply to them of water taken from the Thames at Battersea, and it was notorious that in the districts supplied at that time by the company then referred to, cholera was

very prevalent on each occasion of the visitation of that disease. Whether the supply were constant or intermittent the quality of the water was pernicious. He spoke on this question from extensive experience, not only in London and its environs, but throughout the United Kingdom. With regard to the important question, in whose hands the administration of the water supply should rest, there was the remarkable fact before them that, with one single exception, owing to the opposition of Parliament and the Government of the day, for the last sixty years there had been no new company allowed to be formed for the supply of water to London. Mr. Beggs had said, without giving any grounds for the statement, that it would not be desirable to form a new company, and that two sets of pipes ought not to be put down in the same streets. That was another point to which he took exception. He (Mr. Homersham) submitted that if they were to have an adequate and cheap supply of pure water in London, it was indispensable that they should have competing companies, and that new companies should be allowed by Parliament to be established. The aggregate capital raised by the existing water companies was between seven and eight millions, which had risen to an artificial value of between eleven and twelve millions. Before they could change the present administration otherwise than by competition they must buy up the interests of those companies, and it was proposed, when that was done, to throw them aside as useless, and carry out a large independent scheme. The proposition put forth by Mr. Bateman, who had supplied Glasgow with water from Loch Katrine, was that they should give the old companies an income in perpetuity of £450,000 a year, that being the present net revenue of those companies. He then suggested that they should go to the Severn, and impound the water in artificial lakes, for their supply, while Mr. Hemans proposed that they should go as far as the Cumberland lakes. He thought that of the many monstrous propositions that had been put before the ratepayers these were the most monstrous. Many of the water companies had been literally poisoning the people of London; and looking at the effects produced, he did not see why those companies should be freed from fair competition, and, instead of being compensated, should not be made liable to the legal penalties which were imposed upon railway companies or injuries and deaths occasioned by want of proper precaution in the conduct of their business. He would mention an instance within his own experience, to show the value of competition in water supply. Some years since the inhabitants of Plumstead, Woolwich, and Charlton, became dissatisfied with the quality of the water supplied by the Kent Water Works Company, from the source of the Ravensbourne, and they determined upon having better water from the chalk formations in their own locality. A company was able to be formed for the purpose, without applying to Parliament, and in three or four years 90 per cent. of the consumers of the locality left the old company, simply from the superior quality of the water. The success which attended this measure induced the old company to resort to the expedient of sinking similar wells, in the hope of getting back their customers, the ultimate result being that, after a competition of several years that company abandoned the Ravensbourne altogether as a source of supply, bought up the interests of the new company, and thus the district was now supplied with water free from impure organic matter. That was a practical illustration of what competition had done in the matter of the supply of pure water. As to the present London water, no doubt that above Teddington lock was better than that below it, but, at the same time, he thought the supply obtained from the water-shed of the Thames was not satisfactory. In the Queen's Speech, on the opening of the present session of Parliament, he found the following paragraph:—"Estimating as of the highest importance

an adequate supply of pure and wholesome water have directed the issue of a commission to inquire into the best means of permanently securing such a supply for the metropolis and for the principal towns in the densely populated districts of the kingdom," but when he read the instructions giving to the commission, as published in the *London Gazette* of 28th December, he found it to be as follows:—"After reciting the names of the commissioners, the words were—"for the purpose of obtaining what supply of unpolluted and wholesome water can be obtained by collecting and storing water in the high grounds of England and Wales, either by the use of natural lakes or by artificial reservoirs, at a sufficient elevation for the supply of the large towns, and, in port, firstly, which of such sources are best suited for the supply of the metropolis, and its suburbs, and secondly, how the supply from the remaining sources may be more beneficially distributed among the principal towns. Now in the speech from the throne they were told that the inquiry was to be into the best means of obtaining permanent supply of pure water, whereas in the instructions they found it was to be obtained from natural or artificial reservoirs. What he would say on that point was that if they took the water from any lake, natural or artificial, that lake would represent the composition of a large district of the country around it. It might be of the quality of softness, but it would be impure and contaminated with the droppings of animals, decayed vegetable matter, the exuvia of fish, and the effluvia of organisms, and was altogether unfit to be brought into this or any other city for domestic purposes.

Mr. Elr would mention one or two facts in connection with the supply of water from the chalk basin of London. About twenty years ago, Mr. Webb, a soda-water manufacturer, of Islington, in order to get a supply of water suitable for his purposes, sunk a well to the chalk and obtained excellent water from it. A few years subsequent to that a similar well was sunk in the neighbourhood for the purposes of the Pentonville Prison, and immediately after that was done Mr. Webb found his supply so deficient that he was obliged to sink his well ten feet deeper to get the quantity of water he wanted. A few years after that the Holloway Prison was built, and there also a well was sunk into the chalk basin; the consequence was, the well of the Pentonville Prison had to be deepened, and Mr. Webb had also to sink his well another 20 feet to get the supply he had before. There was another case he could mention. At Nicholson's Distillery, in Clerkenwell, a well was sunk into the chalk, and water obtained from it. A brewer, occupying nearly opposite premises, also sunk a similar well, and each well had such an effect upon the supply of the other that a contest was maintained for a length of time, at a cost of several thousands of pounds, to obtain the supply of water which each party required, and at length the victory was gained only by the superior pecuniary resources of the distillery. In the latter case the wells were sunk within a short distance of each other; but in the case of Mr. Webb and the two prisons, the wells were situated a mile and a-half or two miles from each other. The New River Company, wishing for a larger supply of water, sunk a shaft close to their reservoir in the Hampstead-road, and, after going to a great depth, they could only obtain a supply of 4,000 gallons per day, and at times it was so small as to be insufficient to keep the pumps in working order; the attempt was abandoned after the expenditure of many thousands of pounds. With regard to the point that the present daily supply to the metropolis of 108,000,000 gallons was at the rate of 30 gallons per day for each head of the 3,000,000 of population, he might observe that that calculation was deceptive, because putting aside waste, evaporation, and other causes of loss, a very large proportion of that water was consumed for manufacturing purposes, and a further large quantity for the supply of ships in the port of London, and in the summer large demands were also made for road watering.

With respect to where the supply should be obtained, it was not for him to say, but it would seem that at present one-half the population of the metropolis must make up their minds to be poisoned, and the other half must bring actions against the water companies for doing it.

Mr. W. BOTLY remarked that a good deal of valuable information had been elicited at different times in discussions that had taken place in this room, on the subject of water supply, and there had recently appeared an able pamphlet by Mr. Bailey Denton on the subject, which had been noticed in the *Society's Journal*. He (Mr. Botly) agreed generally with the views expressed in the paper, and particularly with regard to the pollution of water in cisterns. Having had considerable experience in this matter in the town of Salisbury, he could state that great mortality occurred from cholera in the lower districts, where the water was bad, and for a long time the ordinary death rates were very high, but since the water supply had been taken from the chalk, the rate of mortality had greatly diminished, and the health of the town was at present all that could be desired. For his own part he should prefer to see the administration of the water supply in the hands of the vestries, rather than in those of corporations.

Dr. BACHHOFFNER gathered, from what had fallen from Mr. Beggs, that the great panacea with reference to the water supply was, that it should be constant; that appeared to be the pith of his paper. However desirable a constant supply might be, it would involve great expense in adapting the present water-service of the houses to such a system; but he believed that Mr. Beggs had an admirable contrivance of his own (though he had not mentioned it) in the shape of a water-meter, by which the consumer might use as much water as he liked, and pay for no more than he used. As to the obtaining a constant supply, the fact was, they had it already, for there was an Act of Parliament in existence which provided that if three-fourths of the consumers in any district agreed to demand a constant supply, the water company was bound to give it. It was, therefore, their own fault, and not that of the companies, if they had not a constant supply.

Mr. W. B. GALLOWAY said this was a question of such vital importance to the highest interests of humanity that it ought to be discussed irrespective of all pecuniary considerations. As to the quantity supplied, he thought 30 gallons per day per head of population was liberal enough, if it were not for the enormous waste that took place in all large cities and towns. He conceived, however, that a larger supply would be beneficial to such a city as London, and that they ought to have the purest water that could be obtained for domestic use. He suggested a special supply, with a separate arrangement of pipes for that purpose, and that the water for washing, manufacturing, and sewerage purposes should be furnished through the present ordinary channels. Instead of going 200 miles away for water, he would utilise the natural ebb and flow of the Thames by means of reservoirs placed at such an elevation as would give sufficient pressure to be at once available in the extinction of fires, instead of having to wait for the arrival of the engines. He did not think there would be any necessity to break up the streets to provide the second set of pipes which he suggested, but he thought they might be placed above ground. They ought to value the public health above all commercial and pecuniary considerations; and such questions as these should be discussed on the principles of equity, and having regard to the highest interests of humanity.

Mr. BALDWIN LATHAM thought there were some points in the paper which might lead to misconception on the subject of constant supply in respect of the places where that system already existed. It had been stated that in Norwich, under the constant supply system, the consumption had been reduced from 40 gallons per head per day to 12 or 15 gallons. At the period during which the consumption was 40 gallons per head, it proved to

be a ruinous affair for the company; but when an engineer took the matter in hand, and adopted special fittings to prevent waste, and when the consumption was reduced from 40 gallons to 15, the company was brought from a state of insolvency into one of profit. It should, however, be stated that in Norwich, out of a total of 15,000 houses, only 3,000 were provided with water-closets; and at Wolverhampton and other places where there was a constant supply the consumption of water was at a comparatively low rate from the same circumstance. In the case of London, in the event of a constant water supply being afforded, it was to be presumed that each house would have its water-closet, and consequently a large amount would be required for such purposes. He might state that in the 120 towns where he had examined the water supply, the average supply was 25 gallons per head per diem, and where any great falling off in consumption was noticed, it was in those towns which did not possess an adequate system of drainage. With regard to the regulation of the supply by meter, it would on the face of it appear a fair proposition on the part of a company, provided they could in this way realise the fourpence per thousand feet from the consumer. But the quantity of water required by the lower classes was larger than that which was used by the upper classes, and, therefore, if the former were made to pay the same for their water as the latter, they would be compelled to economise their consumption, a most undesirable result. He thought, on the whole, the system of supplying water by rental was a fair and equitable one to all classes. As to the fittings required when a constant supply was given, he believed in the case of London that no difficulty would arise in this respect. They were not now discussing the sources of supply, but in most of the towns in the country where works had been carried out, extensive arrangements had been made for the storage of water; but here they had a large river like the Thames going through London, and thousands of acres along its banks were now under water, and that which would be valuable for storage was allowed to run away to waste. If that could be made available, a better supply might be secured, and the companies could give a constant supply at a not unreasonable cost. With regard to the internal fittings in houses, they found in most cases the water supply for domestic purposes was from cisterns, which also supplied the water-closets, and too often became contaminated with the foul gases there formed. He believed the only remedy for this was the separation of the water used in the closets from that which was employed for domestic purposes.

Admiral Sir F. NICHOLSON said, allusion had been to the Thames by two speakers. He had some acquaintance with that river, and with what was done with regard to purifying it; large powers had been granted, by the Act of last session, to enable those who had charge of the Thames to keep all sewage from entering it. The Metropolitan Board exercised "conservancy" in that respect over the portion extending from Putney to the Lower Reaches, where the sewage was carried out to sea; and it was hoped that in the present session similar powers would be conferred with regard to the portion between Putney and Staines; so that in a short time the whole of the sewage would be kept out of the Thames, as soon as the towns and villages on its banks were able to make such arrangements as would obviate the discharge of any sewage whatever into the stream.

The CHAIRMAN said that was to be in three years.

Admiral Sir F. NICHOLSON added, that whatever the period might be, if they kept the sewage out of the Thames, and prevented the enormous waste of water from the flooding of the land; and if they stored that water, they would be able to give a large additional supply to the metropolis without going to Wales or Cumberland for it.

Dr. WHITMORE merely rose to answer an observation that fell from Mr. Homersham with regard to the sup-

posed impurities of the Thames water. It formed part of his professional duty, as a medical officer of health, to analyse the water supplied by two Thames companies, the West Middlesex and the Grand Junction, and he could say for the last twelve months the water supplied by those companies was in an exceedingly pure condition. On the average the West Middlesex Company did not contain more than half a grain of organic matter in a gallon; and that was also about the condition of the water of the Grand Junction Company. On the other hand, the water derived from the surface wells of the metropolis, and which the inhabitants of London had been accustomed to drink and to speak of as fresh, sparkling spring water, was most impure. In Marylebone there were as many as 25 or 30 of these wells which had been lately supplying the inhabitants with water for drinking, and he had always found from three to six grains of organic matter per gallon in that water. The condition of that water was such that, during the visitation of cholera, he thought it his duty to request the local authorities to close the pumps. Looking to the fact that a large number of towns on the Thames still discharged the sewage into the river, it was a remarkable thing that the companies' water was brought to them in such pure condition as it was; this was the result of the admirable system of filtration adopted. It was, therefore, an injustice to those companies to say they were still supplying the public with poisonous water. For his own part, he thought an intermittent supply was better than a constant one; for this reason, that if they had a constant supply it was necessarily allowed to come in very small quantities. They could draw, probably, from the present supply as much in one minute as they would be able to draw in half-an-hour with a constant supply. Moreover, the change of system would involve the alteration of the whole of the fittings in a house, as the present taps would be blown off by the high pressure required. It would, therefore, involve considerable expense to every householder. With regard to the amount to be supplied, the limit had been fixed at 12 to 15 gallons per head per day, but that was making but small allowance for the discharge of water down the drains and closets, which tended to remove fever and other epidemics from our dwellings. There was no cause for apprehension as to the failure of the present sources of supply. Taking the case of the Thames for the last two or three years, there had been flowing over Teddington Lock an average of 560,000,000 gallons of water in the 24 hours, while we were only taking about 80,000,000 gallons daily above that lock.

Mr. COOPER, as a medical officer of a poor district of the metropolis, was in favour of a constant water supply. The more water they had the better it was for the population in all respects. With regard to the high pressure spoken of in connection with the constant supply system, he apprehended it could be so regulated as to be deprived of all danger even in conveying the water to the top stories of the houses, a system which, in the case of houses let in lodgings, he particularly desired to see carried out, as greatly conducing to habits of cleanliness.

The CHAIRMAN said it had seldom been his lot to hear a more able paper on any subject than that which had been brought before them this evening. Some of the positions were irrefragable, and others were sustained by able arguments, though he could not say he agreed with all of them. It was a wonderful fact that for nearly a quarter of a century the insufficiency of the water supply had been fully acknowledged, and yet not fully remedied. It was almost impossible in this country to get anything done unless the people themselves put their shoulders to the wheel and forced it upon the legislature. The House of Commons invariably waited for the expression of the opinion of the people; it did not attempt to go before them, still less did it attempt to impose the weight of its influence upon them. It therefore remained with the people to force this question of water supply upon the

attention of the legislature. We had had severe lessons of late as to the necessity for an adequate water supply in the metropolis, in the recent visitations of cholera, typhus, diarrhoea, and other malignant forms of disease, the results of which were more deadly to the population than the battle-field was to those engaged in a campaign. Mr. Beggs, he thought, seemed rather to slight the amount of the death-rate which proceeded from an insufficient supply of water: he argued that it resulted from various causes. Doubtless it did, bad air was unhealthy, and bad food was unhealthy; but still he believed, of all causes of sickness, that which proceeded from an insufficient supply or bad quality of water was the worst. In that respect he agreed with Mr. Horsburgh. It was proved by the returns of the Registrar-General in the visitation of cholera last year that wherever the polluted water from the Old Ford went, there cholera went with it. At North Shields, in a part of the town where polluted water was supplied, there cholera appeared; in other parts of the same town where the water was of good quality it was unknown. Did not that prove that cholera and diarrhoea went with bad water? Mr. Beggs had alluded to the question as affecting the poor. That, he thought, was a most important subject. If, from the circumstances by which they were surrounded, they were accustomed to uncleanly habits, they gradually deteriorated in their moral condition, and sank in the scale of humanity, should we not exert ourselves by all possible means to prevent such a result as that? To take a low view of the case. Let them consider the amount of sickness that was thus generated, by which the poor rates were increased, and so the rich were made to pay. He could not agree with Mr. Beggs that the rich should not in these matters pay for the poor, but that all classes should pay equally. The Legislature, in a matter not so important—that of the income-tax—agreed to the principle that the rich should pay, and that the poor should escape; and why should not this be applied in the case under consideration? One speaker had referred to the bad effects of water entering the cistern from the roofs of the houses. No doubt such water became largely impregnated with poisonous gases, which it absorbed from the impure atmosphere of towns. The subject of constant water supply to the metropolis had been urged on the Legislature since the year 1850, not only by theorists, but by the irresistible logic of facts. In the matter of the preservation of property from fire, the question of constant supply was one of great importance. This has been especially evidenced at Wolverhampton and Paisley, where it appeared that there was always supply of water at high pressure, rendering it almost impossible that serious fires should take place. When they took into consideration the fact that the average time for a fire-engine to arrive at the scene of a fire was half an hour, and that in the towns he referred to premises when on fire had been flooded with water in five minutes, the great importance of a constant supply in London, with all its vast amount of property, would be at once apparent. As to the sufficiency of the present supply, it must be borne in mind that what was sufficient some years ago was not sufficient now. The increase of population was considerable and gradually cleanly habits had increased, so that persons who used little water formerly, required now a larger supply. Thus the water supply of all towns became more and more insufficient. Glasgow in 1838, was supplied with 26 gallons per head per day; in 1845, rose to 30 gallons, and that was insufficient; in 1852, was increased to 38 gallons, and at the present time 40 gallons per head was complained of as insufficient. With regard to the purity of the water he ventured to differ from the medical gentleman who had spoken on that subject, though, as he was an authority in the matter, he would not press his opinion. With regard to the rates charged for water, he considered that the water companies placed them too high, particularly when it was considered, as Mr. Beggs stated, that they were

only water-carriers. The gross annual receipts of the several water companies in London amounted to £700,000, and they paid in dividends £400,000 a year. The rateable value of the metropolis being fifteen millions, that income represented one shilling in the pound. That was surely too much to pay for water supply. Mr. Bateman proposed to bring the water from the Pinthimmon hills, free from all impurities, and deliver it at the houses at three pence in the £ only. Mr. Homersham rather found fault with Mr. Bateman's proposition to buy up the old water companies and pay them the £400,000 which they now received in dividends; but that sum would include the purchase of such mains and works as would be required under the new system which Mr. Bateman proposed. He (the Chairman) was sure it would be the unanimous feeling of the meeting that their best thanks were due to Mr. Beggs for the exceedingly able paper he had brought before them.

The vote of thanks having been passed.

Mr. Bzoes having expressed his gratification at the cordial manner in which the proposition had been received, said he had one other acknowledgment to make, and that was to Dr. Bachhoffner, for the way in which he had advertised a portion of his business; the kindness was all the greater because it was unsolicited. He would, however, correct Dr. Bachhoffner's impression that he (Mr. Beggs) was the inventor of a water meter; he was only the seller. On the other hand, he had said nothing about the application of meters to domestic water service; and he believed no inventor had found one which was so applicable; therefore, as they were only suitable for large manufacturing establishments, he thought, if he had entertained any considerations of a commercial nature, he had not advanced them in any way in the paper he had had the pleasure of bringing before them.

Proceedings of Institutions.

BACUP MECHANICS' INSTITUTION.—The report presented at the twenty-eighth annual *soirée*, held on Wednesday, January 2nd, says that the various departments of the Institution have been maintained in a high state of efficiency. The number of members for the separate quarters has varied as follows:—1st, 304; 2nd, 25; 3rd, 160; 4th, 373; the average number for the whole year being rather less than for the preceding year, which was the highest on the records of the Institution. Two hundred and twenty volumes have been added to the library during the year, and 4,410 volumes issued. The directors express their acknowledgments to David Morris, Esq., of Manchester, who kindly gave his services for an evening's entertainment for the benefit of the library fund, and also a handsome donation for the same purpose. In consequence of direct telegraphic communication between Manchester and Bacup having been recently completed, arrangements have been made for the daily supply of two reports of the Liverpool Cotton Market, and also for reports of the Liverpool and Wakefield Corn Markets. The attendance at the classes, both male and female, has been most gratifying, the scholars averaging 95 per night, and in the various examinations the students have taken a fair proportion of prizes and certificates. The day school register now shows a larger attendance of scholars than for several years past, the average being 165. The treasurer's account shows that the receipts have been £524 11s. 1d., and that there is a small balance in hand.

TAXATION OF INSTITUTIONS.

It appears from the *Birmingham Daily Gazette* that a deputation, consisting of the Mayor of Birmingham (Mr. G. Dixon), Aldermen Hawkes and Ryland, of Birmingham; Mr. Councillor Price and the Borough

Treasurer of Leeds, had an interview with the Chancellor of the Exchequer, a few days since, on the subject of the assessment of public buildings to the inhabited house duty.

The deputation was introduced by Mr. Scholefield, M.P., who stated that, in consequence of the shortness of the notice, deputations from several other towns were unable to attend.

The Mayor stated that the object of the deputation was to obtain relief from the taxation of public buildings to the inhabited house duty.

Aldermen Hawkes and Ryland pointed out that till within the last two years the Town Hall, the Midland Institute, and other public buildings in Birmingham were not assessed to the inhabited house duty. At that time the Free Library was not built, but at the present time the Town Hall was assessed at a rental of £1,500 a-year, and the Midland Institute at £1,000, so that in the case of the Town Hall the tax, added to the curator's salary, far exceeded the whole sum received for the use of the hall. The authorities at Birmingham had appealed against the tax, but the Board of Inland Revenue had decided against them, on the authority of a case decided by two of the judges in reference to Wolverhampton some years ago, which decision seemed to provide that if a building was used as a residence for any person it was liable to the house tax. The deputation urged that Parliament could never have intended that a building like the Town Hall, in which only two or three rooms were occupied by a person in charge of the same, should be liable to the duty, and asked the Chancellor if he would introduce a short Bill to exempt such buildings in future. If this were done, the deputation said they should still continue to allow the curator to reside on the premises, but if that request were not acceded to they were prepared to take a house in the neighbourhood, and thus claim exemption. Another alternative suggested by the deputation was that only that part of the building used for residence should be taxed.

The Chancellor of the Exchequer appeared to assent to the reasonableness of the request of the deputation, and requested that the suggestions should be put in the shape of a memorial to the Lords of the Treasury so that he might bring the matter formally before the Government.

The members of the deputation are anxious, as far as possible, to enlist the co-operation of the managers of Institutions in all parts of the country in obtaining the desired exemption.

Manufactures.

PRIZES OF £800 FOR MACHINES FOR CUTTING COAL.—It appears by the *Mining Journal* that with a view to encourage the development of coal-cutting by machinery, the Association of the Colliery Proprietors of South Lancashire and Cheshire have decided to offer three prizes to the inventors of the best machines for the purpose. The machines submitted for competition are to be supplied not later than Nov. 1, and they will then be practically tested in the collieries before a committee appointed by the association for that purpose. The committee will by this means ascertain which machines are most suitable to the requirements of the trade, and prizes of £500, £200, and £100 respectively will be awarded to the three best. That the existence of a practically useful machine will place the coal-owners in such a position that they will be less at the mercy of their workmen is beyond question; but it does not by any means follow that the introduction of machinery will be injurious to the workman, unless he himself makes it so. The value of such a certificate as the winning of even the lowest of the three prizes would be, as to the merit of a machine, beyond estimation, the association being composed exclusively of gentlemen whose reputation for integrity and honour is universal, and whose practical knowledge

is acquired from their habitual occupation being the actual management of the collieries in which they are interested.

Colonies.

AUSTRALIA EXPORTING WOOL TO AMERICA.—The *Melbourne Argus* says an experiment of an interesting nature is about to be tried with one of the staple exports of this colony. Hitherto all the wool exported from Australia has been sent to London or Liverpool, almost exclusively to the former port. It appears, however, that American buyers are not unfrequent at the London sales, and to test the United States market a fine ship has been placed on the berth for New York direct, carrying wool. The result will be looked forward to with considerable interest. It is very rarely that a vessel sails from this port direct to any of the cities of the east coast of America. This is only the second ship which we can call to mind as having been placed on the New York line during some years past. If it finds a good market a new trade may be opened up.

BOOTMAKING IN AUSTRALIA.—It appears by a *Melbourne* paper that the manufacture of boots and shoes on an extensive scale has only recently commenced in the colony, but the strides have been very rapid, and establishments are at present in operation which do business wholesale. At the Intercolonial Exhibition the Collingwood Boot Factory shows a case of boots, all of which were closed and footed by apprentices who have served about 2½ years of their indentures; and all the leather used was tanned at their factory, which is situated in Collingwood Flat. It is, in fact, a tannery and boot factory combined. The hides are received, tanned, and carried to the extent of two or three hundred weekly, the greater portion of which is worked up into boots and shoes. The soles are pegged and not stitched, and the system of division of labour is thoroughly carried out. The number of men and boys on the establishment, engaged in tanning, &c., and making boots and shoes, is about 200, and a vast amount of work is annually turned out, which is distributed throughout the colonies.

Notes.

SOUTHERN COUNTIES ASSOCIATION.—The monthly meeting of the Council was held at the Society of Arts on Tuesday, February 12th., Viscount Eversley in the chair. There were present Mr. Benyon, M.P., Mr. W. B. Simonds, M.P., the Hon. and Rev. S. Best, Colonel Lennard, Rev. J. Goring, Mr. Lyall, Colonel Deedes, Rev. J. S. Clutterbuck, Mr. Clutton, Mr. Rigden, Mr. Turner, Mr. Punnett, Rev. J. Beck, and Mr. Shute (Secretary). Reports were presented by Mr. Rigden from the Agricultural, and by the Hon. and Rev. S. Best from the Arts Department. Both committees were empowered to carry out their recommendations. The offer of the Pavilion for the Loan and Arts Exhibition was accepted, as well as that of the Sussex Horticultural Society to hold their flower show at the same time, and in connection with the exhibition. The Council was adjourned to March 12th.

DWELLINGS FOR THE WORKING CLASSES.—A deputation from the Metropolitan Building Society waited on the Earl of Derby on Saturday, the 9th inst., with the object of obtaining a loan of £500,000 for the building of extensive ranges of workmen's houses in the metropolis. The prospectus of the company, which had been previously sent to Lord Derby, states that the want of workmen's houses was so great and pressing that it would require at least £500,000 per annum to be expended for the next five years to mitigate the evil in any sensible degree. That outlay would supply house accommodation for 100,000 persons. Mr. A. Alison, the chairman of the company, explained the object

deputation. The society which the deputation represented asked the Government to guarantee their debentures bearing 4 per cent. interest for seven years, to the extent of three-fourths of the expense of the buildings in security of which they would give a mortgage on property. Lord Derby called the attention of the deputation to the Workmen's Houses Act of May, 1866, under which any company might obtain loans, to the extent of one-half the cost of the buildings, at 4 per cent. interest. Mr. Alison stated that that act was passed when the interest of money was 10 per cent., and it offered great inducements to the public to act upon by obtaining money at 4 per cent.; but now it offered no inducements, as the interest of money is 3 per cent., and loans to the extent of one-half could now readily be obtained from private sources. He (Mr. Alison) stated the plan he had suggested of issuing debentures, and the Government guarantee was much better for the Government, as it would involve them in no outlay of money. Lord Derby said that although the act of 1866 had not yet been acted on, he fully expected it would. Should, however, the act remain inoperative, the question of amending it might then be considered in the meantime he was not prepared to advise Parliament on the subject.

Correspondence.

CAB FARES.—SIR,—Within the last ten years I have employed thousands of cabs. I never ask a cabman what his fare is, and I never have any disputes with him—because I find the following method an infallible criterion of the distance I travel. A “four-wheeler,” as a rule, goes about eight miles an hour; a “hansom” almost exactly nine miles an hour. In other words, a “four-wheeler” goes a mile in 7½ minutes, and a “hansom” goes a mile in 6½ minutes. I give the cabman the benefit of the fractions, and pay a “four-wheeler” sixpence for every seven minutes he drives me, and a “hansom” sixpence for every six minutes he drives me; I thus pay the “four-wheeler” about sixpence halfpenny a mile, and the “hansom” about sevenpence a mile, and the payment is almost always received with thankfulness. From long experience I know the distance to most parts of London; but if I go any new route, my method of calculating the distance always stands me in good stead. It appears to me that if strangers, or those unused to London distances, adopted this method, no extortion could take place. To simplify matters, the styles of cabs might be paid at the same rate, viz., a penny for each minute travelled. Thus, for a journey occupying twelve minutes, the fare is one shilling; if the time occupied be any time between twelve and sixteen minutes the fare is one shilling and sixpence. By this method the cabman (unless he be a “hansom” going express, as to catch a train) is always liberally paid.

GEORGE WYLD, M.D.

15th February 1867.

THE CAB QUESTION.—SIR,—Not having taken part in the late discussion on cab fares, I could not say a word about cab-strings. To the great inconvenience of their fares, cabmen have generally given up holding the check-string, and some have no check-string at all. I can see no regulations as to check-strings in the police book, but I remember hearing from an old stager, many years ago, that a cabman who did not hold a check-string forfeited his fare.—I am, &c., HYDE CLARKE.

33, St. George's-square, S.W.

THE “COURSE” SYSTEM APPLIED TO LONDON CABS.—SIR,—If the “course” system is to be adopted for London cabs, in justice to the drivers it would hardly be fair to map the metropolis in miles square, for by that means it would be possible, taking the spaces diagonally, to deprive the driver of thirty per cent., and certain districts would be less favoured, as lying upon the horizontal and perpendicular lines. The inter-commu-

nification between north and south, and east and west, might be greatly retarded, whilst the north-west and south-east, and south-west and north-east would in that case be advanced, that is if the lines were drawn from the four points of the compass. To equalise this I would honey-comb the map, giving lines alike in favour of all districts. By this plan the driver might, once perhaps in fifty times, be enabled to charge a "course" for three-fourths of the first mile, and even, perhaps, as often to get three "courses" within a one-mile drive, but these occasions would fall within the fair law of chances, and favour no point of the compass; and, as a compensation, the intersecting points would give the overplus to the rider. I enclose a plan. The dotted line in G shows

where the mile would be slightly elongated in favour of the rider; between H and I, I have marked where the cab-driver would gain; the balance of favour (under a mile) is with the cabman, which, with the present fares, is upon the right side.—I am, &c., JOHN LAMINGTON.

FRIDAY, MARCH 1, 1867.

Announcements by the Council.

ORDINARY MEETINGS.

Wednesday Evenings at Eight o'Clock :—

MARCH 6.—The following subject for Discussion will be introduced by Mr. CHRISTOPHER COOKE :—"On Storm Signals and Forecasts, their utility and public importance with respect to Navigation and Commerce."

MARCH 13.—"On the Tinnevelly Pearl Fisheries." By CLEMENTS R. MARKHAM, Esq.

MARCH 20.—"On Successful Oyster Culture." By HARRY LOBB, Esq.

CANTOR LECTURES.

Owing to a severe domestic affliction, Mr. Chaffers was prevented from giving his concluding lecture on Monday last. Arrangements will, if possible, be made for its delivery later in the Session.

A Course of Lectures "On Music and Musical Instruments," by JOHN HULLAH, Esq., will be delivered as follows :—

LECTURE I.—MONDAY, MARCH 4.

HARMONY.—Introduction—Greek Music—Medieval Musical Science—Acoustics—Musical Sound—Vibration—Pitch—Harmonies—Resultant Sounds—Consonance and Dissonance—Tonality.

LECTURE II.—MONDAY, MARCH 11.

MELODY.—Musical System—Tonality, Ancient and Modern—The Subdominant and Leading Note—Melodies in Imperfect Scales and in Ancient Modes.

LECTURE III.—MONDAY, MARCH 18.

MUSICAL EXPRESSION.—Definition—Difficulties of Musical Composition—Realization of Unheard Effects—The Perfect Cadence—The Renaissance—Imitation—Expression, False and True.

LECTURE IV.—MONDAY, MARCH 25.

MUSICAL NOTATION.—Different Systems, Alphabetical and Special—Neumas—Accents—Lines and Spaces—The Time Table—Modern Notation; its Origin and Growth, Simplicity and Fitness.

LECTURE V.—MONDAY, APRIL 1.

MUSICAL INSTRUMENTS.—Classification—Wind Instruments—Stringed Instruments—The Plectrum, Hammer, and Bow—Instruments of the Ancients—Medieval Instruments; their Introduction into the Church.

LECTURE VI.—MONDAY, APRIL 8.

MUSICAL INSTRUMENTS (continued).—Modern Instruments—Chamber and Orchestral—Combination—The Modern Orchestra—Conclusion.

The lectures commence each evening at eight o'clock, and are open to members, each of whom has the privilege of introducing one friend to each lecture. Tickets for this purpose are forwarded with the present number of the *Journal*.

EXAMINATIONS, 1867.

In addition to the prizes announced in the Programme of Examinations, the following are offered :—

The Worshipful Company of Coach and Coach Harness Makers offer a prize of £3 in Freehand Drawing, and a prize of £2 in Practical Mechanics, to the candidates who, being employed in the coachmaking trade, obtain the highest number of marks, with a certificate, in those subjects respectively.

The Worshipful Company of Goldsmiths offer three prizes—of £5, £3, and £2 respectively—to the three candidates who, being employed on works in the precious metals in any part of the United Kingdom, shall obtain from the examiners the first, second, and next highest number of marks, such prizes to be distinguished as the "Goldsmiths' Company's Prizes."

SUBSCRIPTIONS.

The Christmas subscriptions are due, and should be forwarded by cheque or Post-office order, crossed "Countts and Co.," and made payable to Mr. Samuel Thomas Davenport, Financial Officer.

Proceedings of the Society.

TWELFTH ORDINARY MEETING.

Wednesday, February 27th, 1867; SAMUEL ROBERT GRAVES, Esq., M.P., in the chair.

The following candidates were proposed for election as members of the Society :—

Alsop, John Alfred, 22, Brunswick-square, W.C.
De Salis, Colonel Rudolphe, C.B., 123, Pall-mall, S.W.
Freeland, Humphry William, Chichester.
James, W. H., 78, High-street, Camden-town, N.W.
Kime, William Thomas, Louth, Lincolnshire.
Leslie, Thomas Edward Cliffe, Union Club, S.W., and 22, Old-square, Lincoln's-inn, W.C.
Marsh, William Robert, The Rice Mills, Bromley, E.
Morgan, Fortescue J., Stamford.

The following candidates were balloted for, and duly elected members of the Society :—

Brand, Henderson William, 5A, Courland-grove, S.
Chaffin, Matthew Henry, 18, Hart-street, Bloomsbury, W.C.
Fowler, John R., 1, Mitre-court-buildings, Temple, E.C.
Green, John, 7, Sherborne-street, N.
Harrington, G. H., 5, Billiter-square, E.C.
Hayes, Robert, 1, Pembridge-square, Bayswater, W.
Hoff, Edward, Carpet Manufactory, Louth.
Hopkinson, John, York-place, Oxford-street, Manchester.
Isaac, S., 2, Hyde-park-gate, W.
King, Edmund, 1, Elvaston-place, Queen's-gate, W.
Layton, James, The Wilderness, Baldock.
Lee, Richard, 39, Lothbury, E.C.
Loughborough, Thomas, 23, Austin-friars, E.C., and Selwood-lodge, Tulse-hill, S.
Macintosh, William, 24, Paternoster-row, E.C.
Phillips, Henry Louis, 32, New Broad-street, E.C.

The Paper read was—

ON THE ECONOMY OF TELEGRAPHY AS PART OF A PUBLIC SYSTEM OF POSTAL COMMUNICATION.

By ELWIN CHADWICK, Esq., C.B.

As an apology for my bringing forward this subject, I beg to be allowed to state that from the practical origin of the electric telegraph I have regarded it with great interest, as a means of public and private economy, as an extraordinary means of saving time in intercommunication, as giving to bodies politic, as it were, a new and quicker set of nerves of sensation and of volition; and, as a branch of administrative study on public intercommunication, I have examined it, as a commissioner of inquiry into the means of establishing a general system of police in Great Britain, and have made particular inquiries into the special utility of its application for the public security. As a commissioner of the first general Board of Health, I have moreover had practical experience of its great value, for executive administration, during periods of wide spread epidemic visitations.

In a paper on railway communication, which I had to prepare when I had the honour to serve as president of the Department of Economy and Trade of the Association for the Promotion of Social Science I adverted to a public system of telegraphic post, as necessary for the safe and efficient working of railways, and as complementary to a proper and complete system of internal communication. Mr. Gladstone expressed to me a wish that I should develop that portion of my thesis separately, and more fully. I did so, and submitted a paper to him, and he transmitted it to the then Postmaster-General, Lord Stanley of Alderley, shortly before the change of the Government.

I have felt it due to the Society to bring the question of postal telegraphy before it as coming, as I conceive, under the same economic and administrative principles as those which my noble friend Earl Fortescue (then Lord Ebrington) and a committee agreed with me in proposing for the support of the Society, as bearing on the collection and the distribution of small parcels by means of the post.*

The leading positions which my colleagues of that committee agreed with me in taking, as respects the small-parcels post were:—

That there belong to the public, in the United Kingdom, in round numbers, ten thousand postal stations, and a service of twenty thousand persons for the collection and distribution of letters; that these public establishments, and the services of those officers (chief and subordinate), are available at a comparatively small additional expense, for the collection and distribution of small parcels for public and for other services; that private individuals or companies can only perform the like extent of service of collection and distribution for any one separate object by an equivalent number of separate establishments, and by the services of an equal number of persons, the separate expense of which for the one special service must be so enormous as to be prohibitory to the greatest amount of ordinary service needed by the public;—that, as a consequence, whilst private persons or trading companies can only extend their present means of collection and distribution at a loss, or at charges which must be practically prohibitory, the public postal establishment may give the requisite service at a low rate, with a profit—if, indeed, profit be the legitimate object of the service—a view which I hold to be a pernicious error detrimental to the freedom of trade.

Now, as to telegraphy. Whilst the public have these *ten thousand* stations and a service of twenty thousand persons, all the general telegraphic companies put together have only some nineteen hundred stations supplying about *thirteen hundred* places, and, I presume, only a proportionate number of persons engaged in the collection and the distribution of messages. In many of

the large towns there are two or three competing telegraph companies, each with its own separate stations. It follows that, under these relative conditions, private or commercial telegraphy must be dear, and must be incomplete, and comparatively slow. And for this reason; that, for each of the eight or nine places now unprovided for, there must be a separate telegraphic station, a separate rent, with lights and coal for a separate office-keeper, and separate messengers to be maintained.

I am informed that, as a rule, it will not pay a private telegraph company to set up a separate station for the accommodation of a new neighbourhood unless it be assured an income of from £60 to £100 per annum or more, according to circumstances; or, as one company states, at least fifteen messages every day, and that, too, at the existing high tariffs of charges, which prove to be practically prohibitory of any further very greatly extended use of telegraphic communication in this country. Private telegraphs, under the existing conditions, are, and must be, comparatively dear as well as slow, on account of the comparatively long distances necessarily requiring the additional distance and time for portage of messages. The postal stations, being as eight or more to one of the telegraph stations, the distances of the telegraph deliveries must be (except in the larger towns) throughout the country as eight to one or more. This will the least apply to the more closely populated districts, and the most to suburban districts. For example, in Richmond, where I live, there is a telegraph station, but there are adjacent districts, such as Kew, Mortlake, and Ham, where there are postal stations but no telegraph stations. A telegram from London to Ham must be sent three miles from the station at Richmond by a foot messenger, at the rate of sixpence per mile, and it will be an hour reaching its destination; instead of which, if it were from the postal station at Ham, it might be delivered in perhaps an eighth of the time, or in a few minutes. The telegraph tariff from London is a shilling, but the charge for the portage of the message to Ham is eighteenpence. The tariff for a message from London to Manchester is eighteenpence, but to all the suburbs over three miles the charge is a shilling per mile extra for a horse messenger, and where there are postal stations, where there need be no extra charge for portage, the portage, under the existing system, costs more than the message. In the interior of the densely-populated districts, where the difference of the distances for delivery is not so great, there are yet two or three separate companies, whose separate establishments must be paid for by the public.

I repeat, then, that under the existing conditions of telegraphy by separate trading companies, telegraphic communication, to pay, must be dear—must be incomplete—must be slow—as compared with telegraphy in Belgium, in Switzerland, and in Germany, where the public postal establishments are properly utilised for a responsible public service. Even on the main lines, and between the great towns, the trading companies' service is often vexatiously uncertain and comparatively slow, for this reason, amongst others (as recently explained in answer to complaints of messages, which ought to be delivered within one hour, being detained as long as four) that the railway companies, having the privilege of using the telegraph for working their lines, have the priority of the use of the wires, instead of having their own separate wires, which, under a proper system they would have, and thus the delivery of private messages is frequently delayed.

Besides being dear and incomplete from the cost of separate establishments, trading telegraphy is necessarily dear by reason of the local burdens to which it is subject as an enterprise for private profit. It is subjected to parochial taxation, which in one company amounts, as I am informed, to 9s. 9d. per mile per annum on between forty and fifty thousand miles of wire. A

of traders holding forth promises of large profits to obtain way-leave for their posts and wires over private houses and private lands, as well as over public roads. As the company is based on the principle of making charges on the necessities of private individuals for communication, so private individuals or local bodies think themselves justified in making exactions on the necessities of the mere trading company.

Why," says the attorney, to his client, the landowner or other, "should you give them the use of your premises, or the privilege of passing over your land, without payment? They can't compel you." Sometimes the companies are obliged, by refusals or by private exactions—including the exactions of the local bodies having control of parish or other roads—as the price of the privilege sought, to go at much expense by circuitous routes. If telegraphic communication were conducted as a public service it would, of course, be freed from local taxation and from such exactions, which add to the other charges generally prohibitory of the required extensions. I am assured that, in the whole, future extensions needed may be made under public authority at half the expense that must be incurred by the trading companies, and the country, instead of being disfigured by the posts and wires of several establishments on the same line, would be better served by one. In the French cities, under a postal system of telegraphy, wires are carried conveniently along the eaves of houses, without the number of web crossings from separate companies which are becoming very unsightly as well as inconvenient in London; the inconvenience as well as the expense increasing with the number of the companies, whose wires frequently cross and, in times of storm, touch each other, when messages are curiously and comically flashed in wrong directions, producing confusion and nonsense, of which strange examples occurred during the great snow storm.

Under the existing conditions of dearness and great incompleteness in England, the telegraph may be said to be a class telegraph, in regular use only for stock-brokers, produce-brokers, and the higher class of professional men. It cannot be called a domestic or a general public telegraph. For domestic use it is generally only available to very well-to-do classes—the few. For the higher middle classes its use is chiefly confined to extraordinary occasions, to deaths, to mortal sicknesses, or impending calamity. So much is this so, even amongst wealthy families, that at first a telegraphic message often gives a shock of alarm—that something sad has happened, and is to be communicated. To the many, the lower middle classes and the labouring classes in towns, the present charges may be said to be entirely prohibitory; as also to the agricultural classes. Now it is of national importance that the telegraphic communication should be made to penetrate and animate the agricultural community. Though a farm may be included in a regular postal delivery it is of common occurrence that the cost of a telegram to or from the farmer is half-a-crown, and half-a-crown in the imagination of a farmer is as big as a cart-wheel. To the whole agricultural class facilities for sending district messages would be most valuable. The farmer would be enabled on the exigencies of culture, impending storms, or sudden necessity to get in crops, to telegraph for hands, horses, and assistance; to receive telegraphic messages from his salesman so as to save him from going to market. Salesmen for market garden produce and other transactions of a large amount, for provisioning the larger markets, have not the use of the telegraph, except for wholesale transactions. A cheaper system of postal telegraphy would even be available for the ordinary business of the working classes. An artisan could seek work by it, or, being known to be on the look out for a job, might be telegraphed for, and at the expense perhaps of a sixpenny telegraph, might save half a day or a day, or, having a job in hand in a remote place, on finding himself short of some material, might save a day's time in waiting for it. The saving of

time—the staff of which business as well as life is made—would be considerable if the telegraphic system were to be made more general and cheaper.

For the more ready deliveries in remote rural districts, where the messages may be too few to pay for keeping foot messengers in constant attendance, an arrangement might be made with the schoolmaster of the national or the village school, under a postal system, using the scholars as a corps of ready messengers for the delivery of messages which might arrive in the interval when the letter carrier is on his rounds. A notice would be rung to the school, when the master would name some good boy, who would gladly quit his lesson at the desk and would receive a practical lesson in a service of trust and punctuality, in which he would gladly run over a mountain with the Queen's bag for the reward of a penny.

A valuable suggestion for the dispatch of very cheap messages by the post is made by Professor Wheatstone. He conceives that the messages may be divided into those of ordinary and those of special dispatch by telegraph. There will be a proportion of persons who will not want an answer immediately, or within an hour, but only within two or three hours, or within the day, or so as to save one ordinary postal delivery, to get an answer to some inquiry as to whether a person is at home, where he is gone, when he is expected, how an illness is proceeding, or matters of the like sort, not requiring very special dispatch. The message, with the prepayment of the extra postage stamps, at a less price than for the special delivery, say for 4d. against 6d., or 6d. against 1s., might be put into the pillar, or other post. On being taken to the office, the message would be telegraphed from thence and delivered to its address by the ordinary delivery, so as to save the expense of a special delivery at either end.

Secondary postal telegrams of this sort would have the advantage of freeing the service from the excessive pressure now experienced at particular hours for the dispatch of special messages.

As there are simple and convenient cyphers for private use, the telegraph would, under a good system, be used much more than it is now by private persons and for social purposes, by those who are averse to the transmission of open messages. The companies at present charge double for messages in cypher which would, under improved arrangements, require little extra labour.

Now, as to the general economical or commercial effects of complete and cheap telegraphy. There are indications of its importance in every-day retail commerce, and that the general action of a cheap system of postal telegraphy, more especially in combination with a cheap system of small-parcel post, such as we contended for, and is now in use in Switzerland and Belgium, will improve the whole retail trade of the country, and effect large economies by saving stocks of goods. For example—I find that in the metropolis there are large wholesale houses in the City which have private telegraphs to west-end retail shops, which, instead of keeping large stocks, telegraph for the goods in the City as they are required. Chemists and druggists at the west-end have now private telegraphic communication with the wholesale druggists in the City, whence they get medicines and drugs fresh and fresh as they want them, instead of keeping them deteriorating in store. I am informed by one trading firm in Zurich that, by means of the improved system of telegraphic communication, combined with a parcel post delivery, they are enabled to carry on business with one-third of the stock they used to have before. I am assured by Mr. Cor Vander Maeren, the President of the Tribunal of Commerce at Brussels, that the like effects are manifest in Belgium. I am informed of one warehouse in the city of London, where, by means of the international telegraphic communication, they do as much business now—by economising their supplies by quick

information—with £20,000 of capital, as was formerly done by £100,000 of capital. Now, this system would enable village shopkeepers to do the like. The saving from the mere deterioration of goods kept on hand in large stocks in remote places will be, collectively, considerable; for example, the grocers' stocks—the teas, the fruits, raisins, currants, and such like. On ordinary occasions in domestic life directions may be telegraphed to farm servants and establishments; professional men will forward instructions from their suburban residences to their offices in the City; manufacturers will, from their offices in the City, give directions to the manufacturers in the suburbs. A complete and cheap telegraph would be of special importance for the maritime community, and for the mercantile marine, by enabling passengers and goods to be collected, departures to be expedited, cargoes to be distributed, and parcels to be forwarded. The general economical result would be, practically, to concentrate the whole country.

Our objects, as respects the parcel post, are frustrated by the competing railway companies, who cannot be got to agree among themselves to a uniform goods rate, which it would be so much to the interest of the shareholder as well as of the public to obtain. An opening for the application of our principle as regards the parcel post, has, however, been obtained from the Government, who have conceded the privilege of transmitting samples of goods or other objects by the post.

Having described the conditions of great incompleteness and dearness, as well as comparative slowness, which are inherent to a service by separate competing trading companies, and the obstructions, loss of time, and power occasioned by these conditions to private trade and social life, I now proceed to notice the losses or privations of gain occasioned by these conditions to large branches of the public service, to the police force, to the army and navy, and to the general government of the country.

The adoption of the electric telegraph for the metropolitan, in connection with the rural or county police and general police, would almost double the efficiency of those forces, and would peculiarly serve to promote the habitual use of telegraphy in the rural districts, and its completion as a general national system. The same lines and bearers that led to the police stations, would lead the wires to the adjacent post-office stations, or *vice versa*. Even in the ordinary daily affairs of the rural districts, suppose that gates have been left open and cattle have strayed, or horses been stolen, or a robbery committed. Forthwith the farmer would send to the police station, and a force would everywhere be put on the alert. A known or suspicious character is observed by the police of one district to be on the move; the police of all the other districts would be put on the outlook. At night-fall, again, the poachers might be seen leaving the town by the police, who would telegraph warning to keepers to be on their guard. On occasions of fire, the complete telegraph, carried within reach of every village, would be of great use, though now unknown, with only one-ninth part of the country imperfectly covered. The extra service to the police force would justify contribution to the public telegraph establishments from the public grants now made by Parliament in aid of the county police.

The Minister of War for Belgium declared that placing the railway under public control had doubled the efficiency of the military force, and that the electric telegraph would double it again. This declaration, I believe, would receive the assent of all military men conversant with the subject. I need not enlarge on the peculiar need to this country of all economies of our war force, whether naval or military. At present our War Minister or the Commander-in-Chief writes a telegram on the company's form, sends it to the company's office by a messenger, and pays the fare, I believe, as any one else does, and then it

is forwarded to a barrack or station by another messenger. In this slow operation a Fenian detective might hear to what place the commandant is sending, if not what he is sending about. On looking at a map of the country, within a radius of fifty miles round Cahirciveen, it will be seen that whilst there are about seventy post-offices, there are only seven or eight telegraph stations, a deficiency of about nine-tenths of the available means of quick public information—a deficiency occasioning messages and despatches to be sent slowly by messengers long distances, with the risk of being waylaid and shot down. Of course telegraph wires may be cut, yet that would be an indication of an enemy's presence, and they are easily repaired and guarded. But the deficiency is of means of warning and protection against external as well as against internal enemies. In Prussia, I am informed, indeed it is well known, that the late war the directing general and tactician was with his own telegraph and cypher in a room in his office in Berlin, where no one knew what was being done, whence orders were being flashed to separate divisions of the great army, spreading them wide over divergent bases, so as to confound and mislead the enemy, by gathering them together and concentrating them, with a rapidity unknown, so as to bring overwhelming masses to bear upon him at the decisive battle. If anything had gone wrong, reserves might have been telegraphed for, and brought from the plough, or from the loom, or the work-bench, through the postal stations to a most remote villages, and got from thence into action with a rapidity never before known. The same army, and even the wings of the same army, were wielded as one force from a department in Berlin more speedily than they could have been by cross messages between one division and another, even if they were only a few miles distant from each other.

Private communication was much interrupted to a short time during the war in Prussia, not, as I am informed, on account of the danger of the conveyance of intelligence to the enemy, but mainly on account of the impressment of the most skilful postal telegraphists for the service of the army during the short and great campaign. The success of that campaign and the results, which surprised our Government as well as others, were largely due to the perception and the use made by Prussia of the peculiar advantages of the principle of unity of administration, as applied to a complete unity of communication, all means of communication for the public including the railways as well as the postal telegraph. Captain Webster, R.E., who has closely examined the continental systems of telegraphy, especially for military purposes, states that he considers that the Prussian system has the advantage over all, for private or popular purposes.

The Government of France is carefully protecting its sea coast by complete lines of telegraph. With us, where the protection is so peculiarly needed in time of war against invasion, nothing like this is being done, whilst vast sums are being spent on internal fortifications. Most certainly, in times of peace, for the Coast Guard service against smugglers, as well as for storm warnings, and for succour in the case of shipwreck, in which some five or six thousand persons are submerged, and between seven and eight hundred persons annually drowned, on our coasts, a complete arrangement of telegraphic communication would be the means of saving vast amounts of money, as well as life, and preventing wrecking and much crime. Our war department ought to have the means of complete and direct communication with every barrack and military or naval station in the country. Powers are reserved to take possession of the private trading companies' telegraphs in time of war; that is to say, in a time of hurry, to take possession of disjointed and imperfect works, extending over only one-eighth of the country, unprotected—with wide gaps of thinly-occupied coast unguarded—nothing of profit is

private trading enterprise, but which offer much to the enterprise of invading enemies.

As against one sort of invasion—an invasion, indeed, more dire and ruthless than that of war—the invasion of pestilence, which slew in one year seventy thousand men, women, and children—I had some personal experience of the uses of a telegraphic service. On the visitation of the Asiatic cholera in 1848, we had a very scanty force of competent medical inspectors attached to the General Board of Health. We had despatched two of them to Hamburg, to watch the progress of the epidemic there, and they were at Hull on the point of embarking, when, late in the afternoon, I received a telegram from Edinburgh stating that a case of Asiatic cholera had appeared there. I immediately telegraphed to Hull to detach one of the two inspectors to go on in the next train to Edinburgh, which he did; and to the astonishment of the people there he arrived the same evening within a few hours of their afternoon message. Instances of similar alertness in the direction of a scanty force during the progress of that epidemic were numerous. Immediately an inspector had completed his instructions for meeting the epidemic in one district, without the delay of a post he was, by telegraph, directed to another and distant point of a new outbreak of which we had information. We certainly were enabled by the telegraph almost to double the efficiency of the very small force allowed to us, although the telegraphic service was only available for main lines of communication. If there had been a complete system of telegraphy with every postal station, as now contemplated, and we had been enabled to receive returns of the progress of the epidemic, and transmit directions to medical officers, and information as to assistance hourly as well as daily, the efficiency of the service would have been vastly augmented. Probably it might be so in relation to the cattle plague.

To some persons it might, at first sight, suggest itself, that a consolidation of the central portion of the telegraphic service, apart from the postal service, would be the most eligible course, and that the existing service is beyond the power of management, but those who are conversant with large business arrangements, or with large spheres of administration will be aware, that with system, and under competent direction, the more an establishment has to do, the better every part may be done. It is with this principle in view that I have spoken of the eligibility of the combination of branches of the public service—such as the naval and the military—with the private service of telegraphic communication. I consider, however, that the practicability of the combination is settled by the examples I have cited of continental states, if it were not determined, as I believe it is, by the high administrative authority of Sir Rowland Hill. With respect to the existing telegraph companies, I am unaware of anything disparaging to their general management. Such default as there may be in their position is the fault of the legislature, and this is due to dereliction of the primary public duties of any properly constituted government, and the evasion of responsibilities to maintain complete and cheap means of communication, as a public service. The companies have laboured through difficulties and expensive trial works, and have *vide* conflicts, to accomplish the ends they had legislative sanction in undertaking, and much of this expense would probably have not been incurred had the service been early undertaken by our Government, as it has been by the Governments of Belgium, Switzerland, and the chief German states. The companies would be entitled to compensation on the principles recognised in such cases, which need not, as assumed, be by a direct lump payment, or any payment at all from the Exchequer, but by a special telegraph stock, a money raised on the public security, giving the shareholders some security for their existing dividends, and a payment by giving interest on the capital expended. Instead, however, of adverting here to the losses by the non-application, as I conceive them, of economical

or administrative principles, we have rather to show the gain to be derived from reverting to them.

Assuming that the telegraphic communications were not to increase, and that the stations were not to be extended beyond those of the existing companies, it may be safely stated that the savings of establishment charges by the consolidation of three separate establishments, and by utilising the public establishments, would be found, on close and competent inquiries into the details, to suffice amply for the purchase of the companies, and the compensation of the permanent officers on the usual conditions, and would, moreover, leave a surplus for insuring against loss by early and large reductions of rates upon a uniform system.

The important question which has to be determined for the public is the rates at which the required service may be given to them under unity of management, and also the question of uniform rates. The main ground established by Sir Rowland Hill for the penny postal system was, that whether a letter was delivered in London, or was sent from London to Edinburgh, there was a difference of one thirty-sixth in the cost; that it was not, therefore, worth while to put either the sender of the letter or the post-office to the trouble of taxing the letters. It might at first sight appear that there would be a greater difference in the case of telegraphic messages, arising from the length of the wires. But long land lines of wire are to some extent paid for by each large town or district through which the line passes, so as to properly distribute the charge locally. If, moreover, the uniform franc rate be good for all Switzerland, or the half-franc rate be good for all Belgium and other continental states, we may assume that the principle of uniform tariffs is good for this country, as in the case of letters.

The several great special public uses to which a complete system of telegraphy is subservient, as separate sources of large economies ought, by the distribution of establishment charges over the widest extent of service, to contribute to the reduction of the tariffs, as well as the completeness and punctuality of the deliveries to private individuals. The uniform franc or tenpenny message, all over Switzerland, yields a surplus and increasing revenue; and I am informed that a further reduction of the tariff is contemplated. With a wise state economy they have reduced their uniform letter postage to nearly a halfpenny. In Belgium a reduction has been made from the uniform franc to a uniform half-franc; and M. Vinchens, the able engineer-in-chief of the service, informs me that the number of telegrams have, within a year, been more than doubled, and the gross receipts for the interior service increased more than 18 per cent. There have been some augmentations of establishment charges, apparently having relation to international messages, which have prevented the net returns being as yet fully replaced, though they are expected to be in a short period. Were it otherwise, conceive the immense economical advantage of doubling the speed of business transactions and other affairs by the reductions made. I do not, however, accept the instance of Belgium, a large proportion of whose population is very poor, whose letter communication is little more than half that in England, as a guide for this country, with its greater commerce, manufactures, and wealth. But in London itself, a telegraphic company, for sixpenny district messages, failed "commercially," and was compelled to raise its tariff to a shilling, being borne down, I presume, by the weight of the separate establishment charges, and the consequent incompleteness of its stations, until it was taken up by another company for the delivery of its messages. On the other hand we have in Paris an example of a postal district telegraph which has succeeded in a remarkable manner, with an uniform half-franc, or call it a sixpenny, message. In six months from the time of the reduction from one franc to a half-franc, the number of the messages was

augmented tenfold; but even in Paris, I do not admit that, either in business or in social life, the value of time equals that in London, or in our chief manufacturing cities.

The judgment of the postal authorities in England would, I apprehend, be that it would be safer to begin with a uniform minimum of a shilling rate—*i.e.*, safer for them not to be run off their legs in the first instance. This last is a consideration, to which it is fair to give due weight; otherwise, when a habit is to be altered or framed, the greatest speed will, as a rule, be eventually made, by giving the greatest stimulus to change, in the first instance, charging the lowest rate contemplated, and warranted by experience such as that which I have cited from Belgium.

One special advantage derivable from the proposed extended utilisation of our postal establishment for telegraphic communication would be, that it would serve as a source of contribution to a better payment fairly due to the valuable and underpaid officers engaged in it; and as a means of getting more intelligent and trustworthy persons into the lower departments of the service, and in remote districts.

It is inconceivable that in the face of Continental experience and example the present state of telegraphic communication in this country should be permitted by the public to be continued, and, certainly, all delay of reform must be at the expense of the public for increased compensations. I may add that in the senate of the United States, a committee on the post-office and on the post roads has urged that the post-office department shall be authorised to undertake postal telegraphy, as a work of necessity and public convenience.

Let me recapitulate the chief conclusions which I have to submit. They are—that cheap and complete telegraphic communication, with the speedy and punctual delivery of telegrams, next to the cheap, speedy, and punctual delivery of letters, is of the highest importance to the manufacturing, commercial, and agricultural service of the country, as well as to the service of the state, for the army, the navy, and the police. That the present telegraphic communication of the country is made unnecessarily dear, by the charges of several incomplete establishments, to perform a service that might be better performed by one. That there are in the United Kingdom ten thousand post-offices, and a service of twenty thousand persons engaged in the collection and delivery of letters, available for the collection and delivery of telegrams, as proved by the example of Belgium and Switzerland, and other well-governed continental states. That the private telegraph companies have only some nineteen hundred telegraph stations—a little more than one to five of the postal means of ready collection and speedy and cheap delivery. That, by reason of the charges for separate establishments, rents, and payments for separate services, with local taxes and extra charges, to which trading telegraph companies are subjected, they cannot adequately multiply their existing stations and means of speedy delivery except at double rates of cost and at extra rates of charge, which are practically prohibitory to the habitual use of telegraphic communication by the great mass of the community. That, by the use of the existing postal establishments pervading all parts of the country, the postal service may—as is done by the postal establishments of foreign states—convey telegraphic messages at low rates of charge at a profit, which private companies can only convey at the same low rates, at a loss. That, by reason of the existing conditions of the burthens of multiplied and separate capitals, and of the restricted number of stations, and distant and dear portrages, with consequent high rates of charge, and in many cases slow deliveries, the habitual use of telegraphic means of communication is chiefly confined to the few; to certain classes for large transactions, such as those of the money markets, to large manufacturers, bankers, and professional persons, and to domestic uses on extraordinary occasions. That

telegraphic communication in this country has not been brought within the means of habitual use by the great body of retail traders, nor of the agricultural or middle classes, nor of labourers throughout the country. That it has not yet been brought into complete and proper use for the public by the police, by the navy or the army for the purpose of internal defence or for the action of the chief administrative departments of the State, as it is by responsible constitutional Governments on the Continent. That out of the economy of the charges of the separate establishments of separate private companies produced by consolidation, together with the increased traffic obtainable by telegraphic communication through the post at reduced tariffs, fair compensation may be made to the trading interests in public telegraphy which have been allowed to be formed, and that the proper responsible duties of the Government for the maintenance of the safe and free use of all public means of communication, as a service, may be advantageously resumed without direct expense to the revenue, and with large indirect advantage to it by the augmentation of the commerce and production of the country.

On this subject of inter-communication, which is really one great means of promoting free trade, as well as social intercourse, it is becoming to this country, as constituting an emporium for a large part of the commerce of the world, to have regard to international as well as domestic convenience. By Sir Rowland Hill's great improvement in administrative art and science, England has taken a lead amongst civilised nations in inter-communication by letter. About three years ago there was an international congress held in Paris of executive officers engaged in the postal departments of the chief continental states, to consider and promote improvement in international communication by letter. At that congress, England had its place. Last year, a like congress was held of the executive officers of the continental states to impart to each the benefit of the domestic experience of all scientific, mechanical instruments, alphabets, as well as in administration, and to promote improvement in intercommunication by the telegraph. At that congress, and on that subject, in which England had the lead in the wonderful application of electricity—one great glory of our time—the English Government, to its European scandal for its torpidity, had no place, and England no representative. Is that to continue to be so?

Its proper place may, however, be gained for it by action on disinterested Parliamentary opinion; for there does not stand opposed to the application of correct economic principles in this branch of inter-communication by telegraphic conveyance, the like amount of strong personal interest, nor the like large masses of capital in different categories, with claims to compensation, nor *primâ facie* difficulties of management requiring fatiguing attention and investigation, as there does for the reform of railway conveyance. The conditions of the conveyance by telegraph being less complicated and more manageable, with an authority prepared and competent to deal with them, as, I believe, the chief permanent officers of the post-office to be, there is better promise of earlier success in obtaining the reform now in question. I have no doubt of the eventual general application of the reformed principles governing inter-communication, which I have so long advocated as important to the progress of commerce, manufactures, and the arts, which this Society is united to promote; I believe the cost of every species of conveyance may eventually be thus reduced one-half. Great as have been the benefits derived from the repeal of protection duties on corn and other articles, I believe it will be found that they are inconsiderable as compared with the benefits derivable from the removal of excessive charges on transit, as well as fiscal and other obstructions to free inter-communication.

DISCUSSION.

Mr. JOHN DAVIS observed that Mr. Chadwick, in enumerating the various uses of the telegraph, had not adverted to a singular abuse of it, which had been invented during the recent war in America. It was what they called "tapping" the telegraph; or, in other words, intercepting the messages and possessing themselves of their contents. That was a more ingenious plan than the cutting of the wires; and, as the subject of telegraphs was under discussion, he thought this fact deserved to be mentioned.

Mr. W. B. GALLOWAY remarked that the importance of complete arrangements for telegraphic communication throughout the country could not be over-estimated. He thought Mr. Chadwick's proposal that the existing postal arrangements should be extended to the delivering of messages sent by telegraph was perfectly practicable, and would be highly beneficial to the public. The system on which Sir Rowland Hill founded the penny postage in this country might, he thought, to a great extent be made applicable to telegraphic communication, especially by adopting a uniform rate of charge, and arrangements might be made for the delivering of messages and letters every half-hour, by the present or an increased staff of letter-carriers. The accomplishment of the grand project of establishing telegraphic communication between this country and the United States might, to a certain extent, be regarded as a fulfilment of the prophecy that "Knowledge shall run to and fro in the earth." He had no doubt that in a short time such arrangements would be made in connection with the postal system of the country as would enable the community at large to avail themselves to the fullest extent of the advantages afforded by telegraphic communication.

Mr. WEBBER remarked that he did not agree with the author of the paper in desiring that the existing telegraphic system should be taken out of the hands of the trading companies and placed in those of the Government. He was not himself a believer in Government interference in such matters. They were told in the paper that there were a great number of places to which telegraphic communication did not extend; but at the same time they were also told that in such places farmers regarded the half-crown which they were now charged for a telegram as a thing "as big as a cart-wheel." As a taxpayer, he (Mr. Webber) protested against supplying those gentlemen with such a public convenience as was now proposed until their range of vision brought the half-crown down to something like its normal circumference. They were told that the District Telegraph Company in London had failed, commercially, on account of the little use made of it by the public. In his own experience, in relation to the loss of some property on its way to his premises, he might state that the very public department which of all others ought most to avail itself of telegraphic facilities—viz., the police—neglected to do so in his own case, and left the investigation of the matter to be carried on through the ordinary channels of official communication. He was not quite sure, looking at this instance, whether, if Mr. Chadwick's proposal were adopted, the same red-tapism might not be extended to the whole telegraphic system throughout the kingdom.

Mr. J. H. MACKENZIE was inclined to support the views of Mr. Chadwick. He had no doubt there were many matters which could be best carried out by private enterprise, but he thought the telegraph system was an exception to the general rule. London being the great centre of the trade of the country, it was most desirable that there, more especially, every possible facility in the way of telegraphic communication should be afforded. There had been a company formed known as the Universal Private Telegraph Company, which, however, had not been able to develop itself to the extent that was expected, owing in a great measure to the monopoly

which the other telegraph companies possessed. One great objection to all public systems of telegraphy was that the messages sent were made public, whereas the perfection of telegraphic communication was privacy. The great advantage of the Private Telegraph Company was that business firms having houses in the City and at the West-end were enabled, by a well-known simple instrument which could be worked by a lad after a few weeks' practice, to transmit messages without anyone else knowing anything about them. A few years ago he endeavoured to bring about some arrangement for working the above-named company in connection with the other principal companies, with the view of extending the system of private communication; but after a great many interviews he failed in doing so. He conceived that one benefit to the commercial world and to the public, from the Government taking the matter under its superintendence, would be that they would not look so much to profits on the transmission of messages as to the extension of free trade and free inter-communication throughout the country; and, supposing there was a loss at first, a portion of the surplus revenue of the post-office might be applied to meet it. He thought the benefits of easy and rapid communication ought to be given to the public to the fullest extent possible, and that the surplus profits of the postal department ought not to go to benefit the taxpayers, but to the improvement of the system of communication. They would not desire a lower rate of postage than that which at present existed, but he thought that department might fairly be asked to undertake the risk of any pecuniary loss arising from the proposed extension of the telegraph system under its management. He suggested that the present minimum charge of a shilling per message might be reduced to as low as threepence, and any loss that thus occurred would be more than met, in his opinion, by the surplus profits of the penny postage system. By extending the advantages of the telegraph to all towns having a population of 5,000, a very large additional portion of the public would be benefited. The postmen might be the means of delivering the messages, and the delivery, both of letters and messages, in large towns might be made hourly instead of at longer intervals; the uniform charge of 3d. would pay the expenses of the extra carriers that would be required. Letter carriers in the country would only be too happy to fill up the time which they now employed in business, other than that of the post-office, by delivering these messages. The present existing companies might be left to carry on their present business, even in competition with the government, for while admitting that, as a rule, it was undesirable that government should undertake to enter into competition with private enterprise, he thought this was a national question which might be regarded as exceptional.

Mr. BLASHFIELD agreed as to the importance of extending to the smaller towns telegraphic communication, which could be carried out at less expense under the auspices of the Government than by any other means, inasmuch as the wires could then be laid along less circuitous routes than when the matter was in the hands of trading companies. The placing the telegraph in connection with the post-offices throughout the kingdom would be an immense advantage. At present, even in towns returning two members to Parliament, the telegraph arrangements were often very incomplete. In many places in the midland counties, for instance, the post-offices were opened at half-past six in the morning, and the letters were delivered before seven; but they could not send off a telegram in reply till nine or ten o'clock. In many cases the persons in charge of the telegraph were scarcely able to read writing, and the most absurd mistakes were sometimes made. In some parts of the country it was necessary to go miles to a telegraph station, because, perhaps, some land-owner had refused to allow the wires to be carried over his property. Another advantage of the proposed connection of the telegraph with the post-

office was that the wires would be more under control for the use of the public than they were at present, and a greater amount of protection to them would be afforded than was now the case.

Mr. CAMPIN remarked that the last speaker was in error in supposing that the telegraph wires could be carried by a more direct route, if the system were under Government control, than they were at present. A trespass upon the rights of private property could no more be committed by the Government than by a private company, except under the authority of an act of Parliament, which would be necessary in each case. The same gentleman also suggested that if any pecuniary loss arose from the system being carried out under the management of the post-office, the surplus revenue of that department should be applied to meet that loss; but if there was a complete system of telegraphic communication available to the public for all the concerns of life, it might be expected that there would be a corresponding decrease in the number of letters, and a proportionate falling-off in the revenue derived from that source, so that the surplus might not be so large as it was at present. That was an element in the question which ought to be considered.

Mr. W. HAWES said this subject was very much akin to other questions which his friend Mr. Chadwick had brought before this Society on previous occasions; the point under discussion being, in fact, whether the great works of this country could be carried on more cheaply, more usefully; and with greater public advantage, if placed in the hands of the Government than by being allowed to remain in those of the great companies which now conducted them. For his own part, he thought Government interference in any such matters was most undesirable. All present would agree that if telegraphic messages could be sent for a penny or twopence each it would be a very great boon to society. But, conceding all the advantages which Mr. Chadwick had pointed out as likely to result from greater facilities in telegraphic communication, he differed from him entirely in his view that these could only be obtained by Government interference. Why did not the Government first commence the system of telegraphy, instead of leaving it to the public to do so? If they were so anxious to benefit the public, and to go in advance of public intelligence and enterprise, why did they not originate the system, instead of waiting till the public had incurred all the risk and expense in bringing to perfection one of the most beautiful applications of science that had ever been made in this or any other country? After so many years had been spent in bringing the system of telegraphy into its present state of practical utility, solely by private enterprise, the Government were ready to take it out of the hands of those who had really done the work, asserting that they could carry it on better and more cheaply. Undoubtedly, if Government were to take advantage of all the discoveries that had been made up to the present moment, and without showing any consideration for shareholders—for those who had advanced their capital to bring the system to its present perfection—if they were to start with it now, when all difficulties had been overcome, undoubtedly they could work it more cheaply than was done by the present companies. But would anyone say that Government ought to take possession of all these works without giving ample compensation to those in whose hands they now were? And if this compensation had to be given, where was the advantage? Mr. Chadwick said Government would supply the telegraph to so many more towns, and would perform the service more effectually; but of this there was no proof. If Government were to have the control of the railways and the telegraphs, there was no end to the application of the principle when once it was admitted that Government could do these things better than the public. They had been told by one gentleman that the Government could carry the wires over private

property in a way that a company could not do, and by that means the nearest route could be secured. Even if this were so, there would be little or no advantage, for it made scarcely any difference whether one telegraphic line was a few miles longer than another. The difference of time in transmitting the message was not perceptible; it was only a question of cost of construction, and it was found to be cheaper to carry the telegraph along the side of a railway, than to take an independent direction across the country. A company was started some time ago to carry messages at a uniform rate of sixpence for certain distances, and a shilling beyond. That company started with confidence of success, but it did not obtain it; not that it had not plenty of business; but each year the loss was greater, because every message transmitted cost more than was paid for it. They could only pass a certain number of words per day through the wires; it was simply a question of having the wires fully occupied or not. The concern he had referred to was merged into the old company; and he did not think the public were materially injured. Mr. Chadwick had spoken of the competing telegraph companies, but, practically, there was but one company, though some of the railways had telegraphs of their own; for instance, the South Eastern had a line of wires, of which the public had the benefit, by which many towns were supplied. All the advantage which would be gained by the Government taking the telegraphs into their hands would be the concentration of management, which had been dwelt on in the paper; but that the work would really be done more economically, or more beneficially, under Government monopoly than under the present system he (Mr. Hawes) denied; and he believed the public would be better served in this, as in other matters, by doing the work themselves, than by intrusting it to the hands of Government.

Mr. HANCOCK thought the case made out in favour of the telegraph system being taken into the hands of the Government was so strong as to justify a departure from the ordinarily sound and unimpeachable laws of political economy. The analogy between letters and telegrams was exact, except in one particular. A letter was sent by railway to its destination; a message was forwarded by means of a wire. The writing a telegram was analogous to writing a letter; the only difference was that it had to be committed to another person who sent it by the wire, and had then to be re-written by another official at the receiving office, and to be delivered at its destination. He thought it had been shown that the telegraphic system could be worked in connection with the existing means of collection and delivery of letters which constituted the principal cost of the postal system, for they had been told that the difference in the expense of delivering a letter in London and sending it to Edinburgh was only $\frac{1}{10}$ th of a penny. The larger proportion of expense, therefore, was in the collection and delivery of the letters, not in the transmission. He thought this was a strong ground for asking the Government to take the telegraph into their hands, and combine it with the postal system. They had seen that on the Continent the telegraph system was more convenient, cheaper, and more certain than in this country, and this had been brought about within the last few years, for formerly the telegraph service on the Continent was irregular and the charges excessively high. With regard to the failure of the London District Telegraph Company, the truth was that this was chiefly attributable to its having attempted to do more than its capital could carry out, and in the contemplated extension of its system it was brought to a standstill for want of capital. He thought if that company had had capital enough to carry out its plans in the manner contemplated, it would have been a success instead of a failure.

Mr. SEYMOUR TZULON said there was no doubt that if every small town and village in England could be provided with telegraphic communication at a cheap rate,

would be a great benefit to those places; but there is one great difference between the carriage of letters and the sending of telegraphic messages which should not be overlooked, viz., that letters were collected and distributed by the post-office, but they were carried by private companies. It was true the authorities had the power to send their own trains with the letters, but they found it more economical to send the mails by the public trains, and, on the whole, he believed they were satisfied with the way in which the service was performed. In the case of the telegraph, only one wire could be used for a certain amount of messages. If more messages were required to be sent an increase in the number of wires would be necessary; but in the case of letters, the number of bags composing the mail might be multiplied to almost any extent, and the whole could be delivered at the same time, and carried at the same cost, to the post-office, while, in the case of the telegraph, the expense was increased in proportion to the number of messages sent. There was also this further difference; in the case of letters, there was of course complete privacy, while all messages, even of the most private character, must necessarily pass through the hands of the telegraph clerks at the offices of transmission and delivery; and in the event of the system being transferred to the post-office, we should be placed in the startling position that our most secret communications would all pass through the hands of Government officers, and he thought the public would hardly like to send private messages through that channel. Another difficulty was that it was an essential element in telegraphic communication that there should be immediate delivery of the message. Unless that were ensured, the very essence of the system would be lost. But one of the main points in Mr. Chadwick's proposition was that the ordinary letter-carriers should have the charge of delivering the telegraphic messages; another suggestion was that the boys at a village school should be employed for that purpose; and a third suggestion was that the rural letter-carrier would in that way find full employment for his time. For the reason just stated, viz., that promptness of delivery was an essential point in the system, he thought those suggestions must be at once discarded. If the post-office undertook this work, they must have the means at hand for an immediate delivery of the message, otherwise they would fail in the very object sought for.

Mr. SCUDAMORE (responding to the invitation of the Chairman) said, in complying with the request of the Chairman to say a few words on this subject, he did so under a disadvantage, because although he might state that the officials of the post-office had, some time since, proposed a plan, which was now under the consideration of the Government, relating to this question, he was not at liberty to describe it in detail. If the Government had come to a decision upon the subject he would have been most happy to have submitted the full details to such a meeting as this, because he was confident that any objection which might have been raised would have been advanced in a thoroughly public spirit, and, probably, the post-office would have derived benefit from the consideration of those objections. Thus much, however, he might say, that though he had no claim to all the good words Mr. Chadwick had said in reference to the management of the post-office, he thought they could do more to facilitate communication throughout the country than the existing telegraph companies were able to do. He thought he could, at the proper time, prove that the post-office could, at much less cost than could the present companies, bring telegraph stations nearer to the public, and at the same time save the public considerable expense—that the post-office could, at less cost than the present companies, keep the telegraph open five or six hours a day longer than it now was, and thereby afford the public greater opportunities of sending messages than they now enjoyed; and, by reason of the post-office being able to

work with one staff, with one set of wires, with one set of instruments, and with one central establishment instead of several, they would be able to effect an important reduction in the charges for messages throughout the whole of the United Kingdom. He did not claim for the post-office any superiority of management. He did not deny that the existing telegraph companies could obtain the services of the same class of men as that from which the employees of the post-office were now, and might be in future, drawn; but he did say that, by being able to work with one establishment, with one set of electricians, and with one set of wires, and by reason of their having in every little village of the country an office at which some one must remain stationed, throughout the day—he had no hesitation in saying they could do the work more effectually and more cheaply than any telegraph company could do, unless they incurred greater cost than they did at present. He would give a proof of this. They had heard of the failure of a company which set out with the intention of charging a low and uniform rate for messages throughout the United Kingdom. They had been told it failed because it could not do the work at that price. The truth was the company failed, not because it could not do the work at the price, but because there were two other companies, with more means and larger staffs, who, at the moment the rival company commenced at a low rate of charge, reduced their rates also; and because the public did not show its gratitude to the company who commenced the low rates, by giving their sole support to that company, it failed. But what was the rate they proposed? It was a uniform rate of one shilling for 20 words to any part of the kingdom. There had been a uniform rate of 10d. in Switzerland for many years, and that had produced a profit to the state. In Belgium also, a rate not exceeding one franc had produced a large profit to the state, so much so, that the government gave that profit back to the public by reducing the charge to half-a-franc. It might be said that the cost of the construction of the telegraphs was less abroad than it was in this country, and that, therefore, it was necessary to charge more here; but this was not the case. In Switzerland the cost of the telegraph per mile was, within a small sum, the same as it had been in the United Kingdom; but the rate per message from the commencement, in Switzerland, had been 10d. for 20 words, which had produced a profit. In Belgium, the cost of construction per mile, owing to the smaller extent of country and there being no submarine lines, had been less than in this country; the result was that with a 10d. rate they produced the large profit of 40 per cent. upon the whole capital, and they were now able to give that back in the shape of a reduction of the rate. That which had thus been done in Belgium and Switzerland it seemed to him might be done in the United Kingdom; and he said this without laying any claim to superior intelligence or good management on the part of the office with which he was connected. It had been suggested by one speaker that the surplus which was derived from the revenue of the post-office should be appropriated to meet any loss which might occur upon the telegraph enterprise. He did not imagine that the state would incur any loss whatever by taking the management of the telegraphs; but even if he thought it would, he would be the first to say that relief should be given to the taxpayers of the country from the present surplus. He had heard with surprise this evening the proposition that the surplus of the post-office revenue should be applied to the relief of the national taxpayer, as if it were not so already. He confessed he thought the national taxpayer did now get the benefit. His own opinion was that the surplus revenue from the post-office, which was growing every year, was a proper part of the national income; indeed he looked forward to the time when that surplus revenue would take the place of the whole of the present income-tax; and he thought all would much prefer to pay

the amount of the income-tax in postage than as now by direct-taxation. If, as he supposed, the post-office, by undertaking the management of the telegraph, could not only give greater facilities to the public at a lower cost than that at which they could now obtain them, but at the same time could lay by something in aid of the national budget, would any one say that was not a great advantage? It was suggested that the privacy of the telegraph would not be so complete under the post-office management as it was now. He thought that was a misconception. If they were now considering for the first time the establishment of the telegraph and the transmission of open messages, it might be for them to consider whether they could find a sufficient number of trustworthy men and women to transmit these private messages; but if, while the companies employed precisely the same class as the post-office employed, there had not been a single breach of confidence, it was surely too late to hazard the proposition that the privacy secured under the existing companies would be lost when the work was transferred to the post-office. One of the speakers had said it would be desirable that the post-office should take the management of the telegraph, because it would lead to the extension of the system to all towns having a population of 5,000. He might say that if the scheme now before the government were carried out, he should be disappointed if towns with a population of 5,000 were to be the only places to derive the contemplated benefits. It was intended to go, without loss to the state, to much smaller populations than that, and he did not despair of seeing the time when, supposing the administration of the telegraph was handed over to the post-office, the lines would be as closely extended throughout the United Kingdom as they were at this moment throughout the whole of London.

MR. CHADWICK said, after the very complete and satisfactory answer which had been given by so high an authority in the postal service as Mr. Soudamore, there was little for him to add in reply to the remarks that had fallen from his friend Mr. Hawes. With respect to that gentleman's inquiry why the Government did not commence the telegraph system, and why it had been left to the trading community to do so, he would remark that the postal system itself, in its early origin in this country, was a system of all sorts of trading companies, who, in the language of olden time, "pestered, confused, and obstructed the service," to an extent that rendered it absolutely necessary that public responsibility should be brought to bear on its management. With respect to the possibility of doing anything, he thought the fact of a thing having been done was strong evidence of its possibility; and the fact of what he now advocated having been done in constitutional states like Belgium and Switzerland—to say nothing of despotic states—was sufficient evidence that the same course would be feasible in this country. He would go further and say that a government which could not do what was done in such states as he had mentioned—which could not perform duties like those which had so benefited the public elsewhere—was a government that certainly ought to be reformed. With respect to the "tapping" of the messages, resorted to by the Americans, that was an act which he hoped no one in the country would be guilty of, either under a private or public system of telegraphy. The Austrians, during the late war, tried to "tap" the messages of the Prussians, but they could make nothing of them, and they gave up the experiment, because the Prussian messages were sent in a system of cypher. This would be equally available for any private messages in this country. He was satisfied with the way in which the propositions he had put forward had been confirmed by the high authority they had heard that evening; and he ventured to hope that he should have the support of this Society in promoting an early adoption of the system.

The CHAIRMAN, in closing the discussion, said he

would, in the first place, express his satisfaction that the Society should have thought this subject one which was competent to take up. The ventilation of the question could not fail to do great good, and he thought supported as Mr. Chadwick appeared to be by the majority of those who had spoken, it might be said that a step had been taken in effecting this important object. He confessed that all his own feelings were in favour of the suggestions which Mr. Chadwick had made; but he was not surprised that in this or in any other assembly there should be some little jealousy of government interference. There was doubtless much mis-management in many government departments, but it did happen that there was one department which stood out conspicuous for good management, and that was the post-office; so that he thought they would have no hesitation in committing the telegraph system of the country into the hands of that office, if it should be the decision of Parliament that it was right to do so. He should be sorry to find fault with the management of the existing companies. He believed they did all they could consistently with the interests of the shareholders, but the fact that they were only just beginning to pay a fair dividend must be a proof that they were not in a position to meet the wants of the public. So far as the lines were at present extended they did pretty well, but it became every day more important to extend the system, for we were coming to the time when we could not carry on even the retail trades of the country without the help of the telegraph. Those persons living in places not reached by the telegraph were almost excluded from the advantages of the commerce of the country. It was on their behalf, more especially, he was anxious to see originated some system which would give them the advantage of this rapid means of communication. He did not believe it was possible for the existing system to do that. The post-office was in a very different position. They had the machinery already provided which was needed for extending into the heart of every community the blessings of the electric telegraph system; and he hoped they would be enabled to do so. With these few remarks he begged to call upon the meeting to permit him, in their name, to tender their most cordial thanks to Mr. Chadwick for his interesting and very able paper.

The vote of thanks was then passed, and acknowledged.

Proceedings of Institutions.

MARLBOROUGH READING AND MUTUAL IMPROVEMENT SOCIETY.—An entertainment in connexion with this Society was recently given at the Town-hall, Marlborough, by Mr. George Buckland, of the Polytechnic. The entertainment was entitled "Jest and Earnest."

PARIS UNIVERSAL EXHIBITION.

The preparations are going on with increased rapidity. On the French side the whole of the wood work is finished in many classes, and very little of the floor remains free. The portions devoted to other commissions have not so finished an air, as there is nowhere the same amount of enclosure and general arrangement as there is in the French part. Other countries evidently intend to follow the old plan of covered counters to a considerable extent, while glass cases, systematically grouped, are the general rule of the French commission.

The whole of the gallery to be appropriated to the history of art workmanship, the retrospective museum, is completed, and each entrance closed by solid doors; and the glass cases to contain the marvels of art of past times are being fixed in their places.

The first pictures are all ready for the picture

tures, and other works, so that this portion of the exhibition only awaits the arrival of the works themselves, which can be hung in their places in a few days. The French jury of admission has exercised a very rigorous judgment, the number of pictures admitted being less than six hundred.

As in the industrial portion of the exhibition, so in the picture gallery and retrospective museum, the English commission has adopted different colouring from that of the rest of the exhibition, namely, a flat olive tint in place of a dull red; and the opinion of artists seems in favour of the change. The objectionable false ceiling, too, has disappeared, and has been replaced by a semi-transparent fabric, which stretches over the entire opening between the coverings of the roof. On dull days the galleries look rather sombre, but the English division still possesses the incontestable advantage over all the others placed in the curved portions of the building, namely, that the light will fall nearly equally on all parts, and, moreover, the drawings placed on screens along the centre of the floor, if the amount of space demand such an arrangement, would be nearly as well lighted as the pictures on the walls.

The specimen of English domestic architecture in the park attracts great attention, the bold-pitched roof and gables, the exhibition of the timber work on the surface, the covering of tiles of variegated form and colour, from lack to light-red, and, more than all, the stacks of ornamental chimneys, constructed with moulded and cut bricks of various tints, which, like the tiles, are of English manufacture, induce numerous inquiries as to the country of which the style is native. It still goes by the name of the Queen of England's Pavilion, although it does not appear that it is destined to any such application, but is to contain specimens of various apparatus and arrangements for the warming and ventilation of buildings. Another surprise of the same kind is reserved for our friends abroad in the form of a bay of the new South Kensington Museum, the materials for which are now being prepared under the superintendence of the son of the architect, the late Captain Fowke; this specimen structure will be of large dimensions, about sixty feet in height, and of nearly the same width, and will certainly convey a good notion of our working in brick and terra-cotta, and, it is to be hoped, of our architectural taste also.

In the English department of the machinery gallery a steam crane, sent by Messrs. Shanks, of Arbroath, is mounted upon the service rails, and doing capital work. Two other steam machines are now to be seen standing in inglorious idleness in one of the main roads of the park; these are traction engines, of 6 and 12 h.p., built by Messrs. Aveling and Porter, of Rochester. They stand idly at present under the Union Jack, which now flies bravely in the park, but it is more than probable that their aid will be gladly called in before long.

Amongst foreign departments within the building, Sweden and Norway, Morocco and Tunis, have lately shown great activity; the first-named, like its neighbour Russia, is fitting up its court with characteristic wood-work, and, although heavy, it has an architectural air, and will attract attention.

The courts of Morocco and Tunis are already blazing in gold and colours, as characteristic, and to us as novel, as the decorations of their neighbours—Turkey, Egypt, and the Danubian Principalities; the whole together forming a remarkable contrast with the chaste, solid wood-work of the Russian court close at hand.

The garden enclosed by the building will very shortly be in perfect order, four large oblong basins, in which fountains will play, are in various stages of forwardness, and the flower-beds and gravel walks are being prepared. On the walls of this inner garden, as well as on the outer edge of the building towards the park, the names of the various exhibiting countries will appear in conspicuous characters over the doors of the avenues leading to their several departments. This will be found very

useful, for strangers are greatly perplexed by the curvilinear form of the building.

The number of persons now engaged in preparations for the exhibition is very considerable, and as many as seven thousand people have paid for admission as visitors in a single day; some of the places of refreshment have, therefore, been already opened. Most of the cafés and restaurants on the French side are nearly ready, and the English and some others will not be long behind-hand; one of the former has already had its prices inscribed over its door, and it may be satisfactory to mention that they are not very much higher than those which are charged by the same establishment in the Palais Royal. There seems every promise of abundant means of refreshment at prices more moderate than usual under similar circumstances.

In the park the structure now erecting for the Imperial Commissaire-Général begins to present an imposing appearance; it is composed of solid oak framing, put together in divisions before being mounted on a rusticated basement of artificial stone—*Béton aggloméré*. It will form a pleasing pendant to the English house mentioned above, especially as both belong to the same period, or nearly so. Just behind the offices of the commission and juries, a building of considerable size is being prepared for the service of the post-office and telegraph; these are very conveniently situated, but there will also be what may be called district offices attached to the international club at the opposite side of the park.

Amongst the new buildings is one of considerable size, in which the models and plans of the works of the Isthmus of Suez Company are to be exhibited.

The Sultan's mosque and the three buildings of the Viceroy of Egypt now make a most imposing appearance. The mosque is peculiarly graceful, with its well-proportioned cupola and taper minaret, around which workmen have just fixed the gallery from which the muezzin reminds the faithful of the hour for devotion. The porticos, doors, and windows are ornamented with arabesque work, somewhat resembling that of the Alhambra, but it does not appear that it will be coloured. Two of the Viceroy's buildings are decorated in similar style, while the third, the great temple, in the style of the epoch of the Pharaohs, is being covered within and without with the well-known emblems of the period, and with copies of ancient mural paintings in brilliant hues. For a temporary purpose this temple is a marvellous structure. The fellah's house is nearly finished.

The pavilion of the Bey of Tunis, not far removed from the Turkish and Egyptian group, is a very large building, three stories in height, with a façade capped by two small cupolas, the entrance to which is by means of a bold double flight of steps, in the form of a horseshoe. This, like two of the Viceroy's buildings, is to contain a series of illustrations of the habits, manners and arts of the country which it represents.

The horticultural garden, perhaps, exhibits progress more than any other part of the Exhibition grounds; the iron framework of the glass-houses is nearly all in place, the two aquariums are approaching completion, the lakes and canal are finished, the flower-beds and gravel-paths are nearly all formed, and masses of shrubs are being planted.

It is well to mention that the boilers which are to supply the British section with steam will soon be ready; Messrs. Galloway's three 40 h.p. conical tubular boilers are set, and places are being prepared for one of Messrs. Hayward and Tyler's vertical tubular boilers, and for a "safety tubular boiler," by Messrs. Howard, of Bedford, each of 30 h.p.; a sixth boiler will complete the series.

Everything seems in a fair state of preparation, the only legitimate cause of uneasiness being the bringing to the Champ de Mars of the enormous mass of machinery and goods which are to furnish the Exhibition; in this case the old adage of "first come first served" is one

which every one should not only bear in mind, but act upon with the utmost possible dispatch, if he desires to be in good time.

SPECIAL EDUCATION IN FRANCE.

M. Duruy, the Minister of Public Instruction, continues his efforts to raise the intellectual position of the people of France with unabated zeal and success. Not long since the Minister passed a day at the new establishment for special education at Cluny, and examined all the details of the school and college attached, as well as the works of the pupils, in order to judge of the effect of the new system, and to see what improvements might be introduced into it. The result of the investigation is reported as highly satisfactory. The sympathy existing between the pupils and their instructors is said to be remarkable, and punishment almost unknown. In the case of the normal pupils, there have been no cases of complaint whatever; and during the month of January not a single boy in the junior school was punished, while in December only one was confined to school for half-an-hour.

The establishment already numbers one hundred pupil teachers, and ninety boys in the college; and it already possesses the nucleus of a magnificent practical museum. M. Duruy invited manufacturers and others to contribute towards the collection, and his invitation was admirably responded to by the great iron-masters, coal-owners, engineers, metal-workers, spinners and weavers of all kinds of materials and fabrics, glass, chemical, china, pottery, paper, leather, glue, brick, chocolate, piano, furniture, and other manufacturers. To the donations of these gentlemen have been added fine collections from the Imperial factories, the department of the woods and forests, and other public establishments, the faculties of sciences of Paris and the departments, the Museum of Natural History, and the government of Algeria.

A considerable number of books on science and the Arts have been presented to the library of the college. The department of the Saône-et-Loire, in which Cluny is situated, subscribes £3,200 a-year towards the maintenance of the establishment.

The salaries of the director and professors have been fixed by the Minister, as follows:—Director, from 6,000 to 8,000 francs; professors, of first class, 4,000 francs, second class, 3,500 francs, and third class, 3,000 francs. The salaries of the curators range from 1,200 to 1,800 francs per annum.

The school and college were opened on 1st of November, and the total number of pupils, including those not resident, amounted at the opening to 218.

The Minister was met upon the occasion of his visit by the authorities of the town and department, the rector of Lyons, and several educational inspectors, and by a gentleman from Canada, whose name is not given, but who is described as superintendent of public instruction in Canada; and after the inspection the Minister, the visitors, professors, and the whole of the pupils, both of the normal school and junior college, sat down to a collation, towards which fifty pheasants were sent from the Imperial preserves.

M. Girardin, Dean of the Faculty of Lille, has accepted a professorship of agriculture and rural economy in the Lycée of that town.

The Imperial Society of Agriculture has conferred a medal on M. Wagner, controller of the normal school of Strasbourg, for the aid which he has given to the teaching of agriculture and horticulture in the public schools of France.

A society has recently been formed in the Department of the Eure and Loire, which has for its object the development of popular instruction of all kinds, by assisting poor communes with funds, remunerating teachers, or forming public libraries.

Generally it may be said that all the world in France

is impressed with the enormous importance of public instruction, and that the efforts to give to every youth not only general but professional education are constant and enlightened.

Fine Arts.

CIVIL SERVICE.—SUPPLEMENTARY ESTIMATES.—An additional sum of £905 is required in respect of the designs now on exhibition at Westminster, for the enlargement or rebuilding of the National Gallery. Each architect receives for his plans, &c., £200, and a sum of £105 has also been awarded to the surveyor for assisting the committee of judges. Furthermore, Messrs. Bax and Barry have received £1,575 in respect of the designs on the site of Burlington House, which had to be abandoned when Parliament determined that the National Gallery should remain in Trafalgar-square. Six hundred pounds has been voted to Mr. Cope, as additional remuneration for the frescoes painted by him in the Peers' corridor. It will be remembered that this commission was appointed to revise the payments which had been made to the painters employed in the decoration of the Houses of Parliament; and in consideration of the greater time and labour involved than had been anticipated, and of the higher prices which are now gained than formerly for their works, it was recommended that Mr. Cope, among others interested, should receive further remuneration. For eight frescoes Mr. Cope was, under the original contract, to be rewarded at the rate of £600 each, or £4,800 for all. It is now agreed that he shall be paid an additional £100 on each work, which will make a total of £5,600 or £700 a-piece. Some of the artists concerned are not yet quite content. These supplementary estimates also include an item of £817 for the completion of the monument to Sir John Franklin; likewise the further sum of £50,000 required to meet payments to be made in the year ending March 31, 1867, for expenses in the British Department of the Universal Exhibition at Paris.

WELLINGTON MONUMENT, ST. PAUL'S.—The public will be happy to learn that this model, about which, owing to delays, much discussion has taken place, is now nearly completed, that the execution of the monument itself may properly be commenced. It is proposed now to advance to the sculptor, Mr. Stevens, one-fifth of his commission, viz., £2,800, in addition to the one-third already paid.

EXHIBITION OF HISTORICAL PORTRAITS IN PARIS.—The Pompeian house built for Prince Napoleon in the Avenue Montaigne, has passed into the hands of M. Arsène Houssaye, the well-known author and editor of the *Artiste*, who is now engaged in preparing an exhibition of portraits. It is said that the project has been well received, and that the collection is likely to be a highly interesting one, including many fine and curious works, especially of the revolutionary period. M. Arsène Houssaye's position in the administrative department of the Beaux Arts, and his reputation as an art critic, give him peculiar advantages for such an undertaking.

ELECTION OF ART-JURIES IN FRANCE.—The minister of the Beaux Arts has just issued the regulations respecting the jury for the admission of works of art and the awarding of prizes for the annual exhibition of the works of living artists in Paris this year. The principle of the election of a portion of the members of the juries by the decorated and medalled artists is maintained, but the proportions are somewhat changed. Last year three-fourths of the jurors were elected by the artists, and only one-fourth by the administration; according to the new regulations two-thirds are to be elected by the artists, and one-third by the department. The number of jurors is also considerably reduced. In the section of painting and drawing there are to be but fifteen mem-

pers in place of twenty-four; in sculpture, nine instead of twelve; in architecture, six in place of eight; and in that of engraving and lithography, six instead of eight. Three supplementary members are to be named in each section to fill up vacancies, two to be taken from the the artists' lists, and one to be appointed by the administration. It was feared that the Universal Exhibition would take away from the interest of the Salon this year, but the contrary is now the impression; the space allotted to the fine arts is so restricted in the building in the Champ de Mars—there is not room for more than seven hundred pictures—and the preparations for the year of the exhibition are so large, that the Salon, it is now believed, will be unusually brilliant. In connection with this subject, it may also be mentioned that the artistic season, which usually finishes with the first ray of the summer season, is expected to be prolonged this year to a much later period, and the list of coming sales of works of art is unusually long and important. This might have been predicted from the attractions held out to the amateurs and connoisseurs of all nations to visit Paris this year.

Commerce.

ASPHALTE.—The discovery and use of asphalté may be traced back to the most remote periods, and numerous vestiges of its employment may be found in the ruins in Egypt and Babylon. It seems then to have fallen into disuse, as no traces of it are found in the gigantic works of the Romans; and it does not appear to have been in use until the beginning of the 18th century, when a vein of asphalté was discovered by a Greek professor, named Eyrini, in the course of a geological excursion in the Val-Travers, Neuchâtel; experiments were made by him on its nature, and it was found to be a calcareous substance impregnated with bitumen, and yielding, by heat, a mastic of the same quality as the Babylonian cement. Enchanted by his discovery, Doctor Eyrini, in 1721, published a pamphlet, in which he very much exaggerates the value of asphalté, even stating that it was used in the construction of the Assyrian and Egyptian monuments, totally forgetting that this substance, melting at so low a temperature, could only be used in those latitudes for the foundations, or for those parts sheltered from the sun's rays. In his pamphlet notice is also taken of its being adapted for various purposes for which it is now used, but no mention is made of the use to which it is now applied, and to which it owes its great success, namely, foot pavements. Europe was entirely supplied with asphalté from the Val-Travers until the discovery of it at Seyssel, the working of which has been a most fluctuating speculation. In less than a year £20 shares went up to above £640, and afterwards fell to £1. This had a bad effect for the time on the use of asphalté, which in 1838 began to be employed for the construction of foot pavements in Paris; but now this industry has regained its standing. The municipality of Paris uses it exclusively for the construction of footpaths, and it is rapidly replacing, on a large scale, macadam in the construction of streets.

Colonies.

AUSTRALIAN LEECHES.—A Melbourne journal says that this branch of trade has grown to pretty extensive proportions, both as to the number collected and the distances to which they are forwarded. The trade is principally carried on in connexion with the operations of the Murray River Fishing Company, the fishermen employed by the company turning their attention at seasons unfavourable to the fishery to the collection of leeches. From 150,000 to 250,000 leeches are sometimes

collected in one of the trips of the company's steamer. They are then packed and conveyed to Melbourne, where a large proportion of them are put up for transmission abroad. Large numbers of them are sent to London and Paris, where, it is stated, they are preferred to leeches brought from any other place; but the principal outlet for the export is America, where the demand is always great, from the absence or rarity of the proper kind of leech throughout the whole of that great continent. The shipments of the company are made to San Francisco, Panama, and New York, whence they become distributed in all directions. The export from this colony appears likely to be a remunerative business for some years. The company referred to anticipates that from two to three millions of leeches will pass through their hands this season.

THE INTERCOLONIAL EXHIBITION.—It is calculated that the number of exhibitors at the Intercolonial Exhibition at Melbourne will be as follows:—

Queensland exhibitors	41
New Zealand	56
New Caledonian	42
South Australian. (This includes very many exhibits by few exhibitors.) ..	80
West Australia	196
New South Wales	272
Tasmania	637
Victoria (fine arts, 200; others, 1837) ..	2,037

Total 3,361

DISTRESS IN NEW SOUTH WALES.—The latest accounts speak of a marked improvement in the condition of the working population of this colony, a large portion of which was lately in very distressed circumstances. The discovery of rich gold-fields at the Widdin Mountains has given a means of livelihood to some thousands of persons that were sorely in need of aid, and the demand for labour has been considerably enhanced. In some parts of the country the squatters have found it difficult to obtain shearers, and the farmers have been seriously inconvenienced for want of reapers. The committee appointed to inquire into the distress in Sydney, state that much distress is owing to large numbers of skilled and unskilled labourers being unable to obtain employment, and, for the relief of this state of things, they actually propose to check importations, with a view to "encourage native industry." They recommended "that an Act should be passed to impose a duty of 20 per cent., *ad valorem*, on all timber except in log, on furniture, carriages, shoes, saddlery, harness, and all apparel and slops imported after July 1, 1867."

Obituary.

THOMAS MARTIN, F.R.C.S., died at Reigate, on the 12th of February, in the 88th year of his age. He was born at Pulborough, in Sussex, November 3rd, 1779, and was the eldest son of Peter Martin. His father, who was descended from good English and Scotch families on the male and female side respectively, emigrated from Edinburgh when the events of the '45 were still fresh in memory, and settled himself at Pulborough as a general practitioner. At 15 years of age, Thomas Martin became a volunteer in the Petworth corps of yeomanry, and after serving for two years, he proceeded, on October 1st, 1796, as a student to the then united hospitals of Guy's and St. Thomas's. Cline was at that time lecturing on anatomy, with Astley Cooper as his assistant and demonstrator; Fordyce was teaching to large classes the practice of medicine, materia medica, and chemistry; Haighton was inculcating the principles of midwifery and physiology; while amongst the surgeons were "old Lucas" and Cooper, the uncle of Sir Astley. After completing his studies, he went down to Tunbridge Wells to take charge of the practice of Mr.

Prince, of that place, during his illness. Mr. Martin was early initiated in the difficulties and responsibilities of private practice; with the self reliance thence arising, he finally settled in practice at Reigate, on February 19th, 1800, marrying a few years later the daughter of Mr. Thomas Charrington. In 1812, having always had a fondness for societies and a strong feeling in favour of the principle of association, especially for men engaged in the same profession, he was one of the most zealous and active of those associated apothecaries and surgeon-apothecaries who commenced proceedings, under the leadership of Dr. Mann Burrows, with a view to improved medical legislation. In the same year he founded the Surrey Medical Benevolent Society, which has grown continuously in prosperity. Mr. Martin took an active part in the establishment of the Provincial Medical and Surgical Association at Worcester. He suggested the formation of the south-eastern branch of the association, which, under the fostering care of himself at first, and, later, of his son, Mr. P. Martin, attained its present flourishing and influential position. He established a journal for the better enunciation of the views of the association. In 1830, Mr. Martin suggested the establishment of a mechanics' institute, after the manner of Dr. Birkbeck, to give rational evening employment and recreation to the people in his neighbourhood. The society so formed has grown into increased importance, and has lately given off an offshoot, the "Working Men's Institute." Mr. Martin was one of the first to assist in establishing a Cottage Gardener's Society. He also established some years ago a Surrey Church of England Schoolmasters' and Schoolmistresses' Association. A savings' bank for adults and a penny savings' bank for children had also a share of Mr. Martin's attention. Mr. Martin took an active and liberal part in building new churches and establishing national schools in the parish of Reigate. His energy of body as well as mind was great. It was no uncommon feat with him in his earlier years (when railroads were not, and the byeways of the Reigate neighbourhood were horse knee-deep in mud), after getting through a hard day's work in the saddle, to ride to London (twenty miles), hear an oratorio, ride home the next morning to a breakfast of the simplest kind, repeat his daily round, and return to the plainest dinner, of which any kind of stimulant by exception only formed a part. Nor was it merely in animal power that he showed himself so supreme; like his father before him, he was "the old student" to the end of his days. At an age when most men, when they read at all, read merely for amusement, he was not satisfied with anything short of instruction. With the decision of a man who "knew the good and did it," he united the mildness and the courtesy of a Christian gentleman. With the tact and delicacy of a courtier, he still preserved a perfect singleness of heart; and known here—but how imperfectly known save by a very few—for his self-denying liberality, his character was adorned by that greatest gift of all, which is "charity." He was elected a member of the Society of Arts in 1852, and took a deep interest in the Society's proceedings, especially in that portion of them which related to the Union of Institutions and the examinations connected with them.

SIR GEORGE SMART, the well-known musical professor, died on Saturday, February 23rd, after a short illness. He was born in London, in May, 1776, and for more than half a century was at the head of the musical profession in the metropolis, acting as conductor of the leading concerts in town and country. He was director of the Lenten Oratorios from 1813 down to the period when the Sacred Harmonic Society was started, when the performances of sacred music in Drury-lane and Covent-garden Theatres were given up. He was conductor of the festival in Westminster Abbey, in 1834. He directed the music at the coronations of William IV. and Queen Victoria, and was organist and composer to the Chapel Royal, St. James's, for many years. Sir George

was one of the original founders and members of the Philharmonic Society, in 1813. In 1836 he, at the Liverpool Festival, introduced, for the first time in this country, Mendelssohn's oratorio "St. Paul." The Duke of Richmond, Lord-Lieutenant of Ireland, knighted Sir George in 1811, at Dublin. He was the musical director at Covent-garden Theatre in the Kemble days, when he went to Germany to engage Weber to produce "Oberon." The last-named composer died in the house of Sir George, then residing at 91, Great Portland-street, on the 4th of June, 1826. The career of Sir George was one of the longest ever enjoyed by artist. As a professor of the pianoforte, but much more as a singing master, he had an immense *clientèle*, and he gave lessons until he was long past 80 years of age, and the majority of singers, native and foreign, destined for sacred singing, took lessons of him, amongst whom the names of Jenny Lind and Sontag may be recorded. He was a life member of the Society of Arts, having been elected in 1816, and was a member of the Musical Pitch Committee, appointed by the Council in 1859.

Notes.

STEAM FERRY ACROSS LAKE CONSTANCE.—A plan has been proposed for carrying railway trains across Lake Constance by a steam ferry. According to the plans submitted, 14 to 16 carriages are to be sent on a steam ferry, constructed for the purpose, and furnished with rails; the steam ferry to be 200-horse power. An ingenious mechanical arrangement is adopted for meeting the variation of the level of the water, and thus facilitating the embarkation of the carriages. The estimate of the cost is said to be moderate. The negotiations to carry out this project are already begun with the managers of the Wurtemberg and Bavarian railway.

Correspondence.

THE WATER QUESTION.—SIR,—In reading your notice of a pamphlet on this subject by Mr. Bailey Denton, I could not but feel surprise that an engineer of such eminence should entirely overlook his own undeniable statements,—“that rivers form the natural drainage of the country through which they flow, and that all waste and sewage must inevitably find their way to them in some shape or other.” The great object to be attained, and to which no allusion is made by Mr. Denton, in the quotations which appeared in the *Journal*, is, therefore, to clear our rivers of all impediments in their course to the sea; that is to say, to remove and clear away dams, weirs, and other obstructions, of whatever kind, which have been placed or constructed from time to time for the use of inland navigation, mills, waterworks, or other purposes. Two advantages, of great national importance, would be derived from such a clearance. First, we should hear very little of the pollution of rivers, which would then have a clear course to the sea in deep beds; and, secondly, the recurrence of disastrous floods and inundations would, in a great measure, be prevented, and there would be a considerable diminution of the banks and shoals which infest the mouths of all our rivers, both large and small, at their exit into the sea. In order to render evident the impropriety of artificial obstructions to the free course of a river to the sea, I will suppose that wherever was found a few inches fall in the great drainage system, now being carried out for the benefit of the metropolis, a dam or weir should be interposed, when the consequence would be that the result of the drainage would be nil. It is the same with our rivers, and we are daily witnessing the direful consequences of such a practice. It will be objected that the cost of a wholesale clearance of our rivers would be

enormous, but hardly greater than the estimate of Mr. Denton, which would ultimately be found to be about one-tenth of the real cost, and with little prospect of effectual relief; more especially as the great sacrifice of property from disastrous floods must be placed against the cost of clearance, which would, in a great measure, prevent their recurrence. Inland navigation may now be considered nearly defunct, as it does not produce sufficient revenue to keep the locks and weirs in repair, and these are now in a universal state of rottenness. Indeed, there have been intimations that the canal proprietors, or commissioners, are intending to apply for a parliamentary grant for that purpose, so there can be no great amount of compensation required for the destruction of such worthless property. In regard to mill property the case is somewhat different, but owing to the destruction of our rivers by dams and weirs most water millers have adopted the steam-engine as an auxiliary, which, in many cases, has actually superseded the water-mill. Steam is much more economically applied than formerly, and will be much more so in the future, so that, considering the advantage of situation, the total abandonment of water power, so useful in the early dawn of civilization, will cause no very great sacrifice of commercial interests. Moreover, the statistics of loss of property by floods and inundations would show an amount more than sufficient to cover the clearance of our rivers, let alone other concomitant advantages. The proposal to make reservoirs to hold the flood waters to be returned to the river, would, in my opinion, only increase the evil tenfold. The true and only plan to diminish such disasters, is to endeavour to add to the scouring power of the river current, and by that means to deepen the bed,—an operation quite out of our power to accomplish by mechanical means alone. The fact is indubitable that both running and standing water, if not incessantly supplied with ordure, has a strong tendency to purify itself, and that independently of the great consumption of organic matters, and other impurities, by animal life, and aquatic vegetation. So that half a mile above any town or village, under such conditions, river water may be used with perfect freedom from disease, and London might be supplied with pure water to any amount at small cost. Thames water, as supplied to shipping, in three or four weeks becomes as black as ink, and emits a poisonous smell, but when the cask has stood for a week or two with the bung out the water becomes perfectly limpid and sweet. I have had personal experience of this fact in some of my early voyages, when wooden casks only were used. Mr. Denton, in the course of the remarks quoted, alludes to the river Kennet, the waters of which that gentleman supposes to be drinkable, but which are as foul above the town of Reading as the Thames ever was; and after passing through the town, and receiving the contents of some thousands of water-closets, sinks, and cesspools, it cannot be much sweeter when it joins the Thames, a little below the town. The new Reading Water Company make a pretence of filtering, but when the freshets come down, their filtered water is turbid; and at all times the filter is so badly arranged, that though the Kennet water is perfectly soft, after passing the filter it becomes so hard as to require a lump of soda to enable you to wash your hands with soap. The old Waterworks of Reading still supply all the water unfiltered for flushing, watering the streets, and for the railway works at a very low rate. As a further proof, if necessary, of the hardness of the water supplied by the Reading Company, I need only add that our kettles are quickly coated with successive layers of carbonates, each more than a sixteenth thick, not strongly adhering to each other. The scales are continually breaking off, and cause the boiled water to be always in a turbid state; yet the Reading Company are in possession of certificates from London analytical chemists, of the perfect softness of the water supplied by them to the consumer.—I am, &c., HENRY W. REVELEY.

Reading, Feb. 12.

WATER SUPPLY.—SIR,—In your report of my remarks made in the discussion on Mr. Beggs's paper an error has occurred. My concluding observation was to the effect that having been a member of the Corporation of the city of Salisbury, of the Board of Health, and also a vestryman in each of the parishes where my property is situated, I was of opinion that if the supply must be through either, I greatly preferred its administration being in the hands of municipal institutions rather than in those of vestries. I believe the very different results in the analyses of the water supply arise from some specimens being taken at the in-flow to the cistern, and others at the out-flow. I hold that every cistern, even in our best-arranged houses, should be drawn off—i.e. emptied—at least twice a year, and well cleansed, and if this is absolutely necessary in them, how much more so in those so graphically and truthfully described by Mr. Beggs, where old tubs, dilapidated cisterns, &c., are the only receptacles for the daily supply.—I am, &c., W. BOTLY.

Patents.

From Commissioners of Patents Journal, February 22nd.

GRANTS OF PROVISIONAL PROTECTION.

- Agricultural fecundating agent—279—O. Monnet-Laverpillière.
Aniline, &c., producing colours from—242—E. de Nève.
Artificial fuel—309—S. Plant and W. Tatton.
Athletic exercises, apparatus in—339—W. Prangley.
Bales, &c., packing—200—J. Clark.
Bleaching materials—3232—T. Gray.
Blight in trees, &c., preventing—3403—C. D. Abel.
Boots, &c.—206—B. Hunt.
Breaks—299—R. D. Napier.
Bricks—329—J. Foxley.
Candlesticks—333—H. Dean and G. A. Wheeler.
Card-distributors—226—J. E. Mellin and C. H. Ulbricht.
Cartridge cases—240—C. E. Brooman.
Chimney tops—275—J. A. Murray.
Clocks—108—J. J. E. R. Houdin.
Common road traction engines—267—J. H. Johnson.
Electrical currents, developing—261—C. W. Siemens.
Electric telegraph conductors and cables—212—J. H. Johnson.
Electric telegraphs—220—C. Wheatstone.
Envelope cases, &c.—306—G. W. Betjemann.
Fibres of woods, separating—287—F. Bauman.
Fibrous materials, doubling—234—T. Williams.
Fibrous materials, doubling, &c.—283—H. Ermen.
Fibrous substances, preparing, &c.—293—J. Smith and G. Wilson.
Fibrous substances, producing—281—H. A. Bonneville.
Fire-arms and ordnance—319—J. Flewa.
Fire-arms, breech-loading—246—W. L. Wise.
Fire-arms, breech-loading and needle-exploding, and cartridges for—261—P. Ellis.

- Foil of lead coated with tin, making—323—A. V. Newton.
Furnaces—297—J. Stubbs.
Gas—3300—E. Meldrum.
Gas regulators—265—B. Hunt.
Glass, gilding, &c.—266—E. H. Hughes.
Hammers—202—W. E. Newton.
Hats—301—C. Vero.
Hydrostatic engines—120—C. G. Braxton.
Iron and steel, casting articles in—244—W. E. Newton.
Keys—239—J. Ritchie.
Ladies' wearing apparel—3398—H. W. Shaw.
Lady's companions—14—B. Nokes and T. Sanders.
Lamps—190—J. L. Davies.
Lamps—253—L. C. F. Clerc.
Lime kilns—259—W. Lee.
Liquids in cans, &c., securing—335—W. Rigg.
Malt kilns, &c., heating—248—T. Prideaux.
Mattresses—281—E. Walton.
Metallic cases for preserved food—321—J. H. Johnson.
Metals from their ores, obtaining—286—W. E. Newton.
Metals, rolling, &c.—196—W. Gray.
Ores of lead, treating—326—J. Wright and T. Cobley.
Pianofortes—307—J. F. Phillippi.
Piano-fortes, &c., apparatus used when playing on—315—L. L. L.
Pipes for smoking—263—E. J. Padbury.
Pneumatic apparatus—45—W. E. Newton.
Railway carriages, lighting—58—W. T. Sugg.
Railway carriages, lighting—230—F. C. Cambrellin.
Railways, permanent way of—317—P. M. Parsons.
Rotary engines—100—W. Clark.
Ruling pens—201—W. Hartin.
Safes—3064—J. Nicholson.
Safety bottle case—3400—B. Shaw and J. Appleyard.
Safety-valves—192—J. Wolstenholme and E. Holt.
Screws, cutting—269—E. T. Hughes.
Self-fastening buckles—311—J. D. Bullock.
Sewing machinery—186—G. B. Woodruff.
Shafts, &c., with india-rubber surfaces, forming—239—J. P. P.
Ships—3276—J. H. Grell.
Steam boilers—295—H. B. Wright.
Steam cranes—277—G. Russell.
Steam generators—303—B. Harlow.
Stringed musical instruments—198—W. Palm.
Tack-drivers and carpet-stretchers, combined—188—G. H. H.
Taps—291—A. Bradshaw.
Trousers—3437—T. W. Coudery.
Tramways, &c.—232—J. Haworth.
Wash-basins—147—R. Harlow.
Water-closets—214—E. Lichtenstadt.
Wheelgearing—306—P. Jensen.
Weaving, looms for—156—W. J. and H. Harrison, and B. Cross.
Weaving, looms for—236—W. Dickinson.
Window sashes, &c.—373—T. Bullivant.
Wool, cleansing—267—C. E. Brooman.

Journal of the Society of Arts.

FRIDAY, MARCH 8, 1867.

Announcements by the Council.

ORDINARY MEETINGS.

Wednesday Evenings at Eight o'Clock:—

MARCH 13.—"On the Tinnevely Pearl Fisheries." by CLEMENTS R. MARKHAM, Esq.

MARCH 20.—"On Successful Oyster Culture." By HARRY LOHR, Esq.

CANTOR LECTURES.

A Course of Lectures "On Music and Musical Instruments," by JOHN HULLAH, Esq., is now being delivered as follows:—

LECTURE II.—MONDAY, MARCH 11.

MELODY.—Musical System—Tonality, Ancient and Modern—The Subdominant and Leading Note—Melodies in Imperfect Scales and in Ancient Modes.

LECTURE III.—MONDAY, MARCH 18.

MUSICAL EXPRESSION.—Definition—Difficulties of Musical Composition—Realization of Unheard Effects—The Perfect Cadence—The Renaissance—Imitation—Expression, False and True.

LECTURE IV.—MONDAY, MARCH 25.

MUSICAL NOTATION.—Different Systems, Alphabetical and Special—Neumas—Accents—Lines and Spaces—The Time Table—Modern Notation; its Origin and Growth, Simplicity and Fitness.

LECTURE V.—MONDAY, APRIL 1.

MUSICAL INSTRUMENTS.—Classification—Wind Instruments—Stringed Instruments—The Plectrum, Hammer, and Bow—Instruments of the Ancients—Mediæval Instruments; their Introduction into the Church.

LECTURE VI.—MONDAY, APRIL 8.

MUSICAL INSTRUMENTS (*continued*).—Modern Instruments—Chamber and Orchestral—Combination—The Modern Orchestra—Conclusion.

The lectures commence each evening at eight o'clock, and are open to members, each of whom has the privilege of introducing one friend to each lecture. A set of tickets for this purpose has been sent to each member.

EXAMINATIONS, 1867.

In addition to the prizes announced in the Programme of Examinations, the following are offered:—

The Worshipful Company of Coach and Coach Harness Makers offer a prize of £3 in Freehand Drawing, and a prize of £2 in Practical Mechanics, to the candidates who, being employed in the coachmaking trade, obtain the highest number of marks, with a certificate, in those subjects respectively.

The Worshipful Company of Goldsmiths offer three prizes—of £5, £3, and £2 respectively—to the three candidates who, being employed on works in the precious metals in any part of the United Kingdom, shall obtain from the examiners the first, second, and next highest number of marks, such prizes to be distinguished as the "Goldsmiths' Company's Prizes."

INSTITUTIONS.

The following Institution has been received into Union since the last announcement:—

Rugby Institute.

SUBSCRIPTIONS.

The Christmas subscriptions are due, and should be forwarded by cheque or Post-office order, crossed "Coutts and Co.," and made payable to Mr. Samuel Thomas Davenport, Financial Officer.

Proceedings of the Society.

FOOD COMMITTEE.

The Sub-Committee on Meat Supply met at 10.30 a.m. on Wednesday, the 27th February. Present:—The Right Hon. H. A. Bruce, M.P. (Chairman), Mr. C. S. Read, M.P., Mr. Harry Chester, Mr. Benjamin Shaw, Mr. Edward Wilson, and Mr. James T. Ware.

Dr. THUDICHUM having attended at the request of the Committee,

Mr. SHAW said at the last meeting of the Sub-Committee they had laid before them specimens of meats and other forms of food preserved and prepared under different processes. It was felt by the Committee that they could come to no practical conclusion as to the relative value of those meats, in the absence of information with regard to their nutritive qualities and their adaptability to dietaries upon a large scale. The Committee were, therefore, desirous of hearing the opinion of Dr. Thudichum on these points, previous to considering how far they would be justified in recommending to the Government, or any other public body, that experiments should be made in some of the large public establishments with these forms of preserved meats, either as an entire or partial article of diet.

Mr. CHESTER said on the last occasion the Committee had before them specimens of raw meat from South America, preserved by Dr. Morgan's process, also by the paraffin process of Professor Redwood; but the Committee did not at present see that in either of those specimens there was a complete substitute for such meat as was required for the food of the people in this country. They had also before them a specimen of Dr. Hassall's flour of meat, which might be a very useful diet under certain circumstances, but was hardly a form of preparation that could be employed when meat was to be brought to this country from such distances as Australia and South America. The Committee also had before them specimens of Dr. Liebig's *Extractum carnis*. They thought that was a good thing as far as it went, but they wished to ascertain from scientific opinions how far they were justified in recommending experiments to be made upon these foods, on a large scale, in any of the public establishments. Possibly experiments might be tried in the Navy by feeding the crews of the vessels on

this *Extractum carnis* in connection with salt meat. In this way it might be ascertained whether the nutritive properties, of which salted meat was said to be deprived, could be compensated by the partial use of the *Extractum carnis*. The Committee would be glad to have the opinion of Dr. Thudichum on these various scientific points.

Dr. THUDICHUM—Allow me, in the first place, to make a distinction between extract of meat and meat itself. Extract of meat lacks the essential properties of nutriment. There is, I know, a very prevalent but erroneous opinion that extracts of meat, particularly that prepared on Dr. Liebig's plan, are nutritious. Of course, before I go further with that, I must define the term "nutriment." We know that the body wants in every twenty-four hours a given quantity of carbon, nitrogen, oxygen, hydrogen, phosphates, &c. Now, whereas Liebig's extract of meat contains these elements only in very small quantities, and that mostly in an oxydised condition, it is clear that any practical amount of Liebig's extract would not nourish in the least. Hence this extract, or any similar extract, cannot be called "food." We have to look upon extracts of meat simply as stimulants. Tea and coffee will not nourish a man; but both tea and coffee are strong stimulants of the nerves of the heart and the brain; and it is likely, I think, that the extracts of meat contain a substance which is somewhat similar in its effects to these stimulants. It may contain other substances which we do not know about, but the universal use of decoctions of meat, such as beef-tea, is only to be regarded in the same light as the habit of drinking tea or coffee. These are liquids containing an amount of nervous stimulant, and in that sense only Liebig's extract of meat must be considered. That is the view which I believe Liebig himself takes of his extract. He does not regard it as nutritive; on the contrary, he says it is astonishing that any liquid matter containing so small an amount of solid substance as broth should be by universal consent taken as a restorative, or for some purpose which we cannot define. If the Committee desire to know whether I should recommend them to have experiments made upon the extract of meat of Liebig (which in fact is nothing but condensed beef-tea), I must answer that I do not see that any experiments are necessary, unless they wish to open the entire question what is the sense of our drinking beef-tea or drinking broth.

The CHAIRMAN—What would be the difference of effect produced by drinking a cup of beef-tea and a cup of tea?

Dr. THUDICHUM—The effects of tea and beef-tea are, perhaps, rather analogous, though dependent upon different chemical agents. The effect of tea would be mainly due to the theine which it contains, and would consist in an acceleration of the heart's action, and greater vivacity of the mental powers. A similar effect would be produced by beef-tea, but not so much through its influence upon the heart as through its influence upon the nerves of taste and digestion, and upon the muscular sense, or sense of strength.

Mr. CHESTER—We are now dealing with the subject of meat. You say, as I understand, that the extract of meat is not nutritive?

Dr. THUDICHUM—There is so little nutriment, that if you dissolve a teaspoonful of the extract in a cup of water, and drink it, you would not receive so much nutriment as you would derive from a single mouthful of meat.

The CHAIRMAN—Then is the practice of giving beef tea to delicate children and sick persons altogether a mistake?

Dr. THUDICHUM—That I do not say. It seems to have an important effect, but the effect is not in the sense of nutriment. It is due to the specific effects of certain ingredients contained in it, especially creatine, the action of which, in some degree, resembles that of *theobromine*, found in cocoa. The creatine, which when

in the system is changed into creatinine, has, perhaps, an action upon the heart, and upon the muscles, of which it is a constituent. Then we have in beef tea potassium salts, which the body requires for the production of muscular power. Potash is as essential an element in the chemistry of the muscles as in that of the blood. The chemical substances carried by the blood cannot pass into the muscles without the assistance of the potassium salts. Then there are contained in beef tea certain acids, of which lactic acid is one, and inosic acid another. If we look at the history of food among men, we find they have at all times made provision for acids in their food. The ancient Romans were acquainted with *sauerkraut*, or fermented cabbage. In Prussia and many parts of Germany they have a food made of fermented beans; and in Holland and many parts of southern Europe they have a preparation of fermented cucumbers; and many other vegetables are used in an acid state. This cabbage, or *sauerkraut*, is a strong acid, and so with the beans. These various foods contain lactic acid. This acid, or one identical with it in composition, though differing slightly in other properties, para-lactic acid, is contained in meat. There is no question that the fine flavour of meat—the *osmazome*—which provokes appetite, is due, in part, to the action of this lactic acid. If there is an absence of flavour in any kind of meat, lactic acid, if mixed with the gravy during preparation, acts as a substitute, and produces a relishing flavour. We find, besides, that lactic acid is useful for digestion. Then we have another acid, in various kinds of meat, called inosic acid; of that the properties are not well known. I have no doubt it has a similar action to lactic acid. Beyond that there are indefinable matters in beef tea, or extract of meat, of which we cannot say that they are not useful, but we know little of their effects. We have, therefore, as far as our present knowledge goes, to rely for an explanation of the efficiency of beef-tea upon these principles—viz.:—Creatine, or creatinine, para-lactic acid, inosic acid, inosite and potassium salts. Which of these are essential, and which not, we cannot at present tell. When extract of meat is mixed with water for use the solution should not be too strong. It is a common error, in making beef-tea, to put in an extra dose of this extract, but that is a mistake. Too strong a solution of extract of meat is as bad as too strong tea or coffee.

Mr. SHAW—Are there not carbonaceous matters in beef tea?

Dr. THUDICHUM—All these preparations contain carbon, but that carbon does not form food in the sense of the carbon in albumen, fat, or starch.

The CHAIRMAN—These preparations, then, you admit to be useful as aids to digestion, if they have not the necessary nutriment for the proper sustentation of the human frame. Salt meat being an imperfect food, may I ask you whether this extract of meat would form a complement to that?

Dr. THUDICHUM—I do not think so, because salt meat has been deprived of a certain amount of albumen. I think, however, the loss of nutritious value from salting meat is not very great on the whole. The deleterious effects of the long use of salt meat seem to be due to the effect of the excess of chloride of sodium.

Mr. WARE—What nutritive qualities are there in meat itself which the extract does not contain?

Dr. THUDICHUM—In fresh meat there is albumen, which is very nutritive in this sense, that it supplies the material which is necessary for the production of all the organs of the body. It is also useful in supplying heat, but not so much so as other constituents. We cannot build up the muscles, or the blood, or the eyes, or any other part of the body, without albumen. Next we have muscular fibrine, also termed syntonine. When we mince meat, and extract the albumen by means of water, there remains this syntonine undissolved, but when mixed with dilute acids it becomes a thin jelly, and is afterwards dissolved. Next we have myochrome—that is the

colouring matter contained in the muscles—and this is identical, in chemical composition, with the colouring matter contained in the blood.

The CHAIRMAN—Is that an essential element?

Dr. THUDICHUM—Yes, it acts in the breathing of the muscles during life, and for some time after death. As long as meat is in an eatable condition, this matter remains, so to say, alive; it takes up oxygen, and oxydises the noxious products of the spontaneous decay of albumen, giving out carbonic acid. Hence a butcher takes care to let his meat "breathe." If the meat were shut up close after being killed, it would become putrified in a few hours. This myochrome is a compound body, containing a quantity of iron. It is dissolved with the albumen, and precipitated with it during boiling. Besides albumen, syntonine, and myochrome, meat contains a very little gelatine, which, in the shape of connective tissue, binds together the muscular fibres. When you stew meat a long time the gelatine is dissolved, and you have nothing remaining but a bundle of hard fibres. Then we have the other substances I enumerated before as ingredients of beef tea, viz., creatine and lactic and inosic acids, potassium salts, and finally we have a brown syrupy matter, which is not more definable at present. I have already mentioned inosite, a kind of sugar, met with in French beans, as being also contained in muscle. There is another similar substance, sometimes contained in muscle, and that is animal dextrine or heparin, or glycogenic substance from the liver. But this ingredient varies in a manner which is as yet unexplained. Sometimes, in working up half a hundred-weight of meat, the chemist may get a pound of this matter, at others he may not obtain a trace. Now, when beef tea is made, the albumen and myochrome of the meat are made insoluble by boiling; the syntonine also remains undissolved; the fat fuses, and of the gelatine a small portion is dissolved. After straining there is nothing left in beef tea but inosite, creatine, creatinine, lactic and inosic acids, and potassium salts, and the brown syrupy matter. In case hepatic glycogen was present, this also would be contained in the beef tea. But I imagine that such glycogen would not remain in the extract as prepared by Liebig's company, for during evaporation this dextrine forms skins on the surface, like the skins on milk, which have to be removed, as they prevent evaporation. Liebig's extract would therefore probably never contain glycogen or animal dextrine, while fresh beef tea might sometimes contain it. It might perhaps yield the material for the change which is known as the "turning sour" of beef tea. I may add that meat contains 75 per cent. of water, and 25 per cent. of solids or residue after drying. Of these 25 per cent., 15 to 18 are insoluble in water, 7 to 10 soluble in water; but of these 4 to 4½ become again insoluble by boiling, so that it is not far wrong to say that only from 3 to 5½ out of 25, or from one-eighth to one-fifth of the whole of the solid constituents of meat pass into extract or beef tea. From four-fifths to seven-eighths of the solids are rejected.

The CHAIRMAN—Do you look upon meat as essential to human food?

Dr. THUDICHUM—Certainly.

The CHAIRMAN—If this be so, how is it that the ox, which grows so fat and strong, and which furnishes the richest meat, feeds entirely upon vegetable food?

Dr. THUDICHUM—Briefly, the ox has a different masticating and digestive apparatus from those of man. The food which the ox takes contains all the elements of the food on which we live. If we analyse grass we find it contains albumen and other compounds from which blood can be made. The stalks, leaves, and seeds contain all the ingredients which the body wants for living, particularly one essential matter called cerebrie acid, which is the highest organic compound known. That is contained particularly in grain seeds, especially in Indian corn; eggs also contain it.

Dr. WARD—Chemically, there is no difference between

vegetable albumen and the animal albumen on which man feeds?

Dr. THUDICHUM—They have the same percentage composition, though perhaps not the same atomic weight. We find cerebrie acid, which forms brain matter, has an atomic weight of 2,007; fibrine, about 2,000; albumen, 1,608; and caseine, 807. Vegetable albumen might differ from animal, as caseine does from albumen.

Mr. SHAW—While these substances differ so little chemically, and yet their effects upon the frame are so different, does this not show that there is something in the question worthy of further experiment, and that chemical analysis is hardly trustworthy as to the effects of these matters upon the human frame?

Dr. THUDICHUM—With regard to the custom of drinking beef tea, there is much to be inquired into.

The CHAIRMAN—Following up what I have asked you with regard to the ox, it is clear we have not got the apparatus for converting vegetable food into what we require as the ox has.

Dr. THUDICHUM—No.

The CHAIRMAN—With regard to vegetarians; in what respect do you consider their diet to be deficient?

Dr. THUDICHUM—We can easily adopt a diet of vegetables only which will fully support our body, even in the wear and tear of London life. The vegetarians, here and in America, are a small example of the people in the world who live upon vegetable food. The Japanese as a people eat no meat, but in that country the cultivation of food seed plants has reached the highest point of perfection. It is by the use of seed plants especially that man is enabled entirely to do without animal food; as the organic functions of the plants attain the highest perfection, the seed is formed which contains all the essential elements of food. In this country there are great numbers of people who chiefly subsist upon vegetable food, in the form of bread. The Shakers, the Japanese, and many other peoples in different parts of the world, are practically vegetable feeders, and there is no difficulty in explaining how they manage to keep their bodies at the same weight and strength, and perform all the functions of life. There are some seeds which contain a large quantity of fibrine, albumen, caseine, and other ingredients, besides oil, acids, and starches. There is, for instance, Indian corn; that is remarkably adapted to the maintenance of the body. Then, again, we have the bean fruits; but they do not grow well in this country, because the heat is not sufficient; but beans in the warmer climate of the south are a magnificent food, and too much neglected in this country. Then, in addition, there are peas, lentils, and millet seed. These, taken together, will fully feed a man.

The CHAIRMAN—He must take a large bulk of such food?

Dr. THUDICHUM—No doubt. It is the advantage of meat that it supplies food in the smallest compass, and is dissolved early in the digestive canal. Vegetable food requires more digestion. Hence, the carnivorous animal has a short intestine, the herbivorous a long one. The house cat has gradually had its intestine lengthened, to adapt it to the digestion of bread and potatoes, and in exactly the same manner is the intestine of human vegetarians lengthened and widened to accommodate the greater bulk of their food. If sufficiently fed, vegetarians become big-bellied.

Mr. CHESTER—Are beans, lentils, and such food, easy of digestion?

Dr. THUDICHUM—There you have touched upon a difficulty in their use; these seeds require careful preparation. If not properly prepared, they pass through the stomach undigested. That is the main objection to the use of grain foods by the common people. They have neither the knowledge nor the means of properly cooking such food; therefore, practically, there is nothing like bread for them. It is soft; it is that which gives them the least trouble; it is most easily digested, and no other grain food can enter into competition with it.

Mr. CHESTER—What the Committee want to know is, what it is necessary to add to the *Extractum carnis* to give it the nourishing properties of meat, the supply of which is so deficient.

Dr. THUDICHUM—If you add eggs to beef tea you produce an equivalent, in a nutritive sense, to meat. That would make up fully for the loss sustained by the solid materials being rejected. You might also boil beans with the extractum, or add peas, lentils, or millet. Practically, it would be best to boil these seeds in soft water, or in water made soft by the addition of a crystal of soda, a sufficient length of time, and to add the extractum at the end of the boiling, just before serving. Seed one year old only should be used; seed two years old is not good. By such means beef tea or extractum may be made equally nutritive to meat.

Mr. SHAW—Have we not now arrived at a point at which experiments with regard to dietaries might be made with the *Extractum carnis* and the seed vegetables which Dr. Thudichum has spoken of?

The CHAIRMAN—No doubt experiments of this kind might be made, but I doubt whether these vegetables could be got in sufficient quantity, or at sufficiently low price, to form a staple article of food in this country. Is Indian corn equally nutritive in its young and soft state as in its hard and ripened condition?

Dr. THUDICHUM—No; in its young and soft state it has not one-fourth the amount of solid substance which it possesses in its ripe state.

Mr. CHESTER—Is it possible to preserve albumen for any length of time?

Dr. THUDICHUM—Albumen, when kept from the air, may be preserved for a long time. We can preserve it in eggs for a year or two; but though it may remain unchanged in its essential properties, it loses its appetizing qualities. That is the difficulty with preserved foods, that though apparently in a good state of preservation, they lose the qualities which make them acceptable to appetite.

Mr. E. WILSON—Would not these qualities be restored by the addition of appetizing condiments?

Dr. THUDICHUM—To a great extent, no doubt; but that presupposes a knowledge of the art of cookery. As the common people do not know how properly to cook the simplest thing, they would not succeed in imparting appetizing qualities to preserved food materials.

Mr. SHAW—Is it your opinion that the theory of cooking should be taught in schools, and perfected by practice afterwards?

Dr. THUDICHUM—I would let the theory of cooking enter into the teaching of the schools, and that would open the minds of the children to the fact that cooking is one of the most essential things to be learnt.

Mr. SHAW—I have mentioned this matter in connection with the educational examinations of the Society of Arts, but the opinion generally expressed was that cooking could not be properly taught apart from actual practice.

Mr. CHESTER—I assisted in the establishment of an Industrial School at Highgate, where all the girls were taught cooking and house work generally.

The CHAIRMAN—Do you not think it would be possible to prepare a catechism of cooking, or a few short, practical chapters, applicable to the condition of the poorer classes in this country, and which might be communicated to the upper classes before they left school without difficulty?

Dr. THUDICHUM—Undoubtedly. I have for a long time conceived the idea of preparing a little book, which might be called "The Spirit of Cookery," and which should contain the elementary principles of cooking.

The CHAIRMAN—What I should suggest would be a pamphlet of five or six pages, containing a few essential rules of cookery, applicable especially to the poorer classes.

Dr. THUDICHUM—Those rules would be very useful; but their execution would have to go hand-in-hand with

a number of other practical improvements calculated to minister to the welfare of the lower classes. You do not only to give to them rules how to cook, but to be within their reach the necessary apparatus with which to cook, for the success of cooking is dependent upon proper apparatus for the purpose. No good economical cooking can be done on grates as they are at present constructed. The introduction of a new practical and economical cooking apparatus for the poor would be a great boon.

Mr. CHESTER suggested that every good apparatus which was introduced might be tried in the first instance in the model lodging-houses, such as those founded by Mr. Peabody. He also suggested that a very useful charitable association would be one for the distribution of iron pots among the poorer classes.

Mr. C. WILSON—I would ask one question of Dr. Thudichum. Have you given any attention to the subject of the rate at which, running over the whole set of articles suitable for diet, sufficient quantity could be purchased for a man in health to fill his stomach comfortably, as any one of us would do at an ordinary dinner?

Dr. THUDICHUM—He could probably do so at the cheapest rate upon bread and cheese.

Mr. E. WILSON—I presume you mean that that would be the lowest rate now, with the present limited choice of articles of food; but, supposing he had the whole range of diet available, and was educated in the proper preparation of food, would he not be able to fill his stomach with food cheaper than bread and cheese?

Dr. THUDICHUM—I am not able to answer your question off-hand; it is a subject that would require investigation.

Mr. E. WILSON—In the East various kinds of food are eaten, cooked with a little fat. I am sure that food may be made from them cheaper than with bread and cheese.

Dr. THUDICHUM—Possibly such forms of vegetable food might be imported with advantage, but we have cheese in this country, which they have not in the East; and the cheese, though taken in small quantity, affords an amount of nutriment which the other kind of food does not supply. I may add another consideration: no doubt, beans and peas, lentils and lupina, are a good kind of dried seed food, and cheaper than any other description; but when the question arises of producing them in this country the laws of agriculture interfere, and it is found that here it will not pay the farmer to grow anything except the best grain. Lupina would be the last resource of agriculture. Where the soil was insufficient to grow wheat and beans and peas you must grow lupins, because the roots of these plants extend deeply into the subsoil, and gain what nourishment there is there.

Mr. SHAW—Are there not vast extents of such land abroad, where they would be glad to grow such grains for exportation? and they might be grown in places otherwise unproductive, if the demand was sufficient to induce a large amount of cultivation.

Mr. READ—Dr. Thudichum has told us of the difference between the nutriment contained in tea and beef tea, will he be good enough to tell us the difference between the nutriment in malt liquor and beef tea?

Dr. THUDICHUM—The nutriment in malt liquor is greater than in beef tea; it contains alcohol, which is food. I will state the grounds on which I base this assertion. Last summer I performed an interesting experiment. I invited my class in pathological chemistry to meet me one afternoon in the garden of the present St. Thomas's Hospital, formerly the Surrey Zoological Gardens. There were thirty-three in number, including myself. We drank, from two o'clock in the afternoon till seven in the evening, 44 bottles of wine, consisting of white and red Hungarian, Burgundy, and Sauterne. The wine had been previously analysed, and the quantity of alcohol it contained determined. The 44 bottles of wine, drunk by the 33

persons, contained, in the aggregate, 4,000 grammes of absolute alcohol. The whole of the urine passed by these people from two o'clock in the afternoon till six o'clock the next morning was collected and distilled. There were 24 distillations; and there were left, after the last distillate had been dehydrated, 10 grammes of alcohol, the rest having been burnt up in the system. Supposing that ten grammes more passed out with the breath and through the pores of the skin, it would give only five grammes out of every 1,000, or a-half per cent, as the quantity which was left unused by the economy. We have here a direct proof that out of the whole quantity of alcohol drunk only a quarter per cent. was excreted by the kidneys.

Mr. E. WILSON—Is it quite certain that all the alcohol that was retained was beneficially used up?

Dr. THUDICHUM—I have no doubt all was beneficially used up. I do not say that for a man to drink a bottle and a quarter of wine is beneficial to him, but I say this—that whatever alcohol it contains has a stimulating action, and, moreover, a warming action.

Mr. CARROTT—Against this experiment may be placed some investigations made by two French chemists, MM. Lallemand and Perrin, and supported by Dr. Edward Smith, tending to show that as soon as alcohol is taken it at once begins to pass off, through the skin and otherwise, perfectly unchanged.

Dr. THUDICHUM—These experiments are quite inconclusive, as no estimation of the quantity of alcohol passing off had been made, which I regard as very small. Besides, alcohol contains sugar and gum. It also contains albuminous matters, which cause it to ferment; they are digestible. Then it contains phosphates in considerable quantity. The phosphates abound in fruit and grain, in bread, and in meat, and no doubt they are of great importance in the animal economy. Then there are in beer certain undefinable substances—the brown syrupy matter, which we cannot define. There is also acetic acid in beer, and the extract from the hops, which are, to a slight extent, narcotic, something like tobacco.

Mr. CHESTER—There is no nutriment in hops?

Dr. THUDICHUM—No; it merely has a soothing effect upon the brain.

The CHAIRMAN mentioned that the result of an experiment tried by a contractor with a number of navvies working at night at a tunnel, one gang being supplied with bread and butter and coffee, and the other with bread and cheese and beer, was, that the larger amount of labour was performed by the men who took the bread and butter and coffee.

Mr. E. WILSON remarked upon this that the men put upon the coffee regimen might not have confined themselves to that beverage, while with the others it might have been a question of an extra quantity of beer, and it would not be known what quantity of beer the men might have drunk in the day time.

Dr. THUDICHUM—There is no doubt whatever that alcohol drunk at certain times, in certain conditions of the body, takes off the edge of the understanding, and should not, therefore, be taken early in the day. On the other hand, if a man is tired from a morning's work, and has taken as much food as he requires, he feels a craving for something which mere food would not supply, and that is given in alcohol.

The CHAIRMAN—What do you say to the particular experiment with the navvies which I have mentioned?

Dr. THUDICHUM—The experiment you have related it is impossible to judge of, for this reason—you do not know what the precise condition of those men was. You do not know what they had eaten and drunk the day before, and what they were accustomed to eat and drink. One set of men may have been accustomed to beer and the other to coffee. To one set of men it may have been so much extra beer acting upon what they had previously taken.

The CHAIRMAN—*A priori* do you assume, supposing

the men to have been moderate in their previous living, that the bread and cheese and beer would be as good food for them as the bread and butter and coffee?

Dr. THUDICHUM—I have no doubt of it.

Mr. READ—Supposing a labouring man, whose chief diet was bread, were to drink a glass of beer, would that be a substitute for the meat which he could get for the same money?

Dr. THUDICHUM—It would be but a poor substitute. The nutritive value of the beer would be very small compared with that of the meat. If a man spent fourpence in beer he would not obtain half the nutriment he could get if he spent the same amount of money in meat.

(Dr. Thudichum, having received the thanks of the Committee, then retired.)

Mr. PHILPOTT, having been introduced to the Committee, stated that he had been in the habit of melting down 1,000 to 1,500 sheep per day, in Australia, for four months together, but he had tried in vain to discover any process by which the meat could be preserved for food, except, perhaps in the form of the extract. He had had great quantities salted but it did not succeed.

The CHAIRMAN—Supposing a means were discovered of preserving meat in a fresh state for many months, could such a supply be obtained from Australia and other parts, as would make the business commercially successful, and afford such a supply of meat as is required in this country?

Mr. PHILPOTT—An unlimited supply of the very finest quality of meat could be obtained. We only want the means of preserving it. Throughout the vast tracts from Victoria to Brisbane there are no means of disposing of the carcasses except by melting them down.

The CHAIRMAN—You know of no means of preserving the meat so as to make it a useful and valuable article of export to this country?

Mr. PHILPOTT said he knew of none except Liebig's process, used by Mr. Tooth. If the extract of meat were made upon a very large scale, he thought it could be sold at half the present price in this country, seeing that a bullock cost only about £3 or £4 in Australia; but he could not state the quantity of extract which such a carcass would yield. At present the meat itself could only be preserved by salting it so intensely that people would not eat it in this country; and he was not aware of any means by which the salt could be extracted from the meat on its arrival here. Legs of mutton salted were sold at 3s. per dozen, and they were the finest quality of meat, but they had become hard by the salting. He believed if a process of preservation were discovered to enable meat to be brought from Australia or Buenos Ayres, in such a condition as would lead to its use in this country, it could be sold with profit to the producer at 2½d. to 3d. per pound.

CANTOR LECTURES.

"ON MUSIC AND MUSICAL INSTRUMENTS." By JOHN HULLAH, Esq.

LECTURE I.—MONDAY, MARCH 4th.

HARMONY, &c.

Mr. Hullah, after briefly cautioning his audience not to expect a concert, to which the lecturer was to stand in the relation of programme; and professing his anxious desire to aid in the work of the Society of Arts, which he conceived to be to collect, cherish, and diffuse ideas, spoke of the music of the ancients, the nature of which the researches of scholars had been far from successful in revealing. He quoted a passage from Professor Blackie's "Homer and the Iliad," which showed, not so much what Greek music was, as what it was not—anything in the least like the music of modern times. Music as a self-sustained and self-contained means of addressing the senses and the intellect, is a new art, the youth of which had been witnessed almost by men living;—and not merely a new art but a new

science; for the "music" of the *Quadrivium* represents principles about which modern musicians give themselves no concern. This, in some respects is to be regretted. In the entire neglect, for instance, of Acoustics (once the principal part of music), musical performers, as well as composers, have possibly lost or delayed the discovery of many truths and first causes, which they alone have the organization, the opportunity, and, it might seem, the motive, to search into. From the separation of practical music from acoustics, improvements in musical instruments have been fewer and further between than in other branches of mechanical application; varieties occur in pianofortes, for which the makers are unable to account; and in the construction of rooms for musical performance, or public speaking, failure is at least as common as success. Possibly, however, as there are graces "beyond the reach of art," so there are truths out of the depth of science; but this need not prevent our cultivating the graces, and using the truths accessible to either. The first principles of the science of harmony are intimately connected with the first principles of the science of acoustics, and many things in the former are best explained—can only be explained—by the latter. The lecturer then, as a preliminary to the demonstration of this, proceeded to explain the cause of sound, and the qualifications necessary in order to make sound musical. The vibration of the air must be regular and sufficiently frequent, otherwise sound is not appreciable; on the other hand, if vibration be too frequent, its result will be inaudible. There are means of demonstrating the existence of sound beyond the reach of our organisation. The pitch of a sound depends on the number of vibrations communicated to the atmosphere by the body which causes it, in a second of time. There are many ways of ascertaining the number of these, one of the simplest and most easily explained being the invention of Mr. J. Henry Griesbach. A drawing of this instrument was then exhibited, and its action shown. A fourth part of a string, itself too long and heavy to make a musical sound, is isolated, and tuned to any pitch required. The entire string is then set in motion, and the pace of its vibrations being moderate (not exceeding eight or ten per second), they are without difficulty recorded on a paper wound round a cylinder by a pin attached to a spring, struck by the string at each successive vibration; another pin, connected with a seconds pendulum, marking the recurrence of each successive sound, and consequently the number of vibrations made in it. Mr. Hullah wished to draw especial attention to this and other similar instruments, because it is very commonly thought that evidence about pitches in different countries and times rested altogether on tuning-forks—instruments notoriously liable to injury and change. The fact that elevated sounds result from such prodigious numbers of vibrations is calculated to excite astonishment; not more so than another—that there is no such thing as a simple unmixed sound, or at least that no such sound can be maintained for more than an instant. The lecturer then proceeded to explain the nature of harmonics, and the construction of the harmonic chord, not for its own sake as a natural phenomenon, but on account of its bearing on practical harmony. Harmony is justified (if it require justification) by the harmonic chord, which proves that polyphony has its basis in nature. An elegant passage from Rousseau was quoted on the other side, but, happily, discussion on the comparative merits of harmony and melody is now practically useless. We cannot get rid of harmony if we would, and would not if we could. Mr. Hullah then proceeded to show that the relation of harmonics to their prime—the constitution of the harmonic cord, accounts for much that has long been universally accepted as true among harmonists—that had even been accepted by them, and practised empirically before that construction was understood; science in this, as in other cases, subsequently justifying art. From the harmonic chord we first derive the triad, and ascertain what notes

within the limits of a common cord can be drawn, repeated in the octave,—hence, what is the real importance or effectiveness of those notes. And the harmonic chord furnishes us with a new law for the arrangement of chords—having its lowest intervals lowest, its smallest highest. Moreover, a combination in which the ear will not rest—in musical language, a *discord*; not a discord in the common sense, or poetical sense, but a combination, of itself beautiful, and always suggestive of continuity, sequence, or something to come after it. More than all, the harmonic chord includes always two sounds, the roots of which may be regarded as the first principle of modern harmony, and that which distinguishes true music, more than any mere superficial difference, is the music of the 15th and 16th centuries. These sounds are the 4th and 7th of the natural (or *diatonic*) scale, whose contact or neighbourhood alone reveals the scale, and whose resolution on the 3rd and 6th does not only the scale but the *mode*.

The musical illustrations were exhibited on diagrams as well as played on the pianoforte by the lecturer.

THIRTEENTH ORDINARY MEETING.

Wednesday, March 27th, 1867; Colobed H. SYKES, M.P., F.R.S., in the chair.

The following candidates were proposed for election as members of the Society:—

Beaumont, Somerset, 144, Piccadilly, W.
Dunderdale, James, Tiverton-lodge, Cheshire, Manchester.
Hopkin, W. K., 5, New Cavendish-street, W.
Hutchinson, Robert Hopwood, Tenter-house, Bath.
Karslake, Sir John B., M.P. (Solicitor-General), 2, Pall-mall, S.W.
Nield, Jonathan, Dunster-house, Rochdale.

The following candidates were balloted for and duly elected members of the Society:—

Busbridge, Walter, 4, Chester-place, Plumstead, S.E.
Guise, Francis Edward, 2, Middle Temple-lane, E.C.
Ingall, Charles, Mellish's Wharf, Limehouse-road, E.
wall, E.
Johnson, John Robert, 31, Red Lion-square, W.C.
Keating, Lorenzo, 231, New-cross-road, S.E.
Kernaghan, B., 70, Bishopgate-street Within, E.C.
Oliver, Thomas, 66½, Northumberland-street, Newcastle-on-Tyne.

The subject introduced for discussion was—

STORM SIGNALS AND FORECASTS. THEIR UTILITY AND PUBLIC IMPORTANCE WITH RESPECT TO NAVIGATION AND COMMERCE.

By CHRISTOPHER COOKE, Esq.

The science of meteorology, or of weather knowledge, even when viewed irrespective of prediction, seems to be even yet in its infancy. The Egyptian geographer Ptolemy, in the second century of the Christian era, wrote upon this subject, and he described the particular constituents of the atmosphere, the character of meteors, and what he deemed to be rules for predicting various atmospheric phenomena. Since his day various observers have studied this important subject, and some of them have published, in America as well as in Europe, the results of their labours; yet our present Astronomer Royal is reported to have declared at Aberdeen, so recently as September, 1859, that, "with respect to aqueous vapours and atmospheric waves, inquiries had only served to throw obscurity on the subject, and he regarded the science of meteorology as one of the most desperate with which we have to deal." Not many months have passed since I read a statement that Sir John Herschel disclaimed the unenviable title of

a weather-prophet; and an eminent French astronomer has expressed a similar opinion respecting weather wisdom, whatever may be the progress of science. The late Mr. William C. Burder, of Clifton, would not undertake to predict weather for more than twenty-four hours in advance; and even this mild state of prediction he would not venture to publish, while other meteorologists scout the idea of prediction entirely.

On the other hand we find there are various prophets, each conscious that his system is the best, and that it must prevail. A well-known writer upon predictive meteorology, Mr. W. H. White, the weekly London correspondent of the *Mark Lane Express*, observed, a few years since, with respect to these systems, that "first and foremost on the list stands Admiral Fitzroy, backed up by Government support and high patronage throughout the length and breadth of the land; but his predictions are limited to storm periods from observation alone, and hence his predictions are at short date, sometimes a few hours only, and at most twenty-four to thirty hours. Yet, even these enable him to send telegrams to most of the English ports to warn the sailors that a stormy period is at hand, by which means he has saved the lives of many brave seamen, and prevented the loss of much valuable property. This method, useful as it may be, does not furnish the most remote hint at the cause of the predicted storms thus signaled, and hence, whenever it shall please the God of storms to remove the admiral from among men, the theory of the cause of storms, forecast, will die with him, and man will still be as ignorant as before the admiral commenced his career—a grievous state of things, but true. Storms predicted by him did not come at all, while others came unpredicted, so no theory can be attached to such a course of prediction, notwithstanding that his system produced many important results."

Then there is the plan of comparing one season with another, yearly or by a cycle of years, carried on by the late Mr. Howard, by Mr. George Mackenzie, who paid much attention to the east wind, and by other observers. Mr. Thomas Plant, of Birmingham, makes his predictions by comparing one season with another one, and then he draws his conclusions accordingly; while the equinoctial theory, advocated by Dr. Kirwan during the last century, and recently by Mr. Thomas Du Boulay, has its admirers; and Lieut. Saxby, R.N., is a believer chiefly in the lunar influence. The astro-meteorologists, since the time when Admiral Fitzroy suggested that perhaps the astrologists of old were wiser in their generation, have taken the title of astronomic meteorologists, and they teach that the great changes of pressure, temperature, draught, moisture, electrical displays, heat and cold, are caused by solar, lunar, planetary, and cometary bodies, according to their respective lights and aspects, as they move through space, and form certain angles.

The Report of the Committee "appointed to consider certain questions relating to the meteorological department of the Board of Trade," dated in May, 1866, clearly explains the history and mystery of Admiral Fitzroy's occupation, as well as the results of his ill-understood but partially useful labours with respect to meteorology. Let all persons interested in this subject read and well consider that elaborate statement. I can only refer to it briefly upon this occasion. It appears that so long since as the autumn of the year 1861, Lord Palmerston's Government issued instructions to our British consuls to assist in the collecting of statistical information respecting atmospheric phenomena, in order to assist the investigation of storms, which was carried on by Colonel Reid; and this fact of itself proves that the subject has been deemed important by the British Government.

In 1862, Lieut. Maury, on behalf of the United States Government, collected various marine meteorological observations, and Sir John Bargoyne, British Inspector-General of Fortifications, contemplated some land

observations, and suggested to Lieut. Maury that both schemes should be conducted on one plan. After some correspondence and delay, a conference met at Brussels, in August and September, 1863, which made suggestions respecting various meteorological instruments, and prepared a form of meteorological register, with instructions, to be used for observations at sea. In 1864, the Royal Society, in reply to a communication from the Board of Trade, made suggestions respecting the observations, but there was "no indication that it was a part of the functions of this department to publish undiscussed observations, or to speculate on the theory of meteorology, still less to attempt the prognostications of weather." Ten years since Admiral Fitzroy contemplated his system of forecasting weather, and five years later he reported that "by continued and consecutive series of charts, constructed on the simultaneous principle, an insight into the laws of our atmosphere, into meteorological dynamics, had been gained, which enabled us to know what weather will prevail during the next two or three days, and when a storm will occur."

At the meeting of the British Association, in September, 1859, at Aberdeen, "the Committee of the Section of Mathematical and Physical Science" having represented the probable importance of occasional telegraphic communication between a few widely-separated parts of Great Britain and Ireland, by which warning may be given of storms, the General Committee recommended an application to the Board of Trade for such an arrangement as might further the object authoritatively. Consequently, in the year 1855, Admiral Fitzroy, as an officer of our Government, and on behalf of the Meteorological Department of the Board of Trade—established at £4,200 a year—prepared an experimental plan for the conveyance of intelligence of approaching storms; and on the 25th February, 1860, the Council of the British Association ruled "that storms existing at one place should be telegraphed to other places; but they did not intend the elaborate system of foretelling probable weather that was subsequently adopted."

Admiral Fitzroy deemed his five years' data sufficient for the system of forecasts, and for predicting the weather generally. In 1860, 15 stations in the United Kingdom were appointed for receiving continental telegrams of weather through Paris, and for the daily communication there of our weather. In February, 1861, he first gave his weather warnings and storm signals, which, in August, 1861, were extended to 80 additional places, making 130 altogether; and daily forecasts of weather were gratuitously published in the London newspapers. These soon became popular, although opposed and derided by some persons. Foreign Governments were much interested in the system. The predictions were sent to Paris, and the system was adopted there and at Berlin, as well as in Russia, Holland, and Italy. Occasional warnings were sent to foreign countries by the English Meteorological Office. On the 5th June, 1860, the *Times*, in a leading article, had thus referred to the "shocking character of the wreck register. In 1869, 1,600 persons perished within sight and reach of our own coasts, while coming storms might be accurately predicted by barometers, which, with anchors, cables, and lifeboats, would be the means of saving many lives, provided that a central station, communicating by telegraph with distant parts of Ireland and Cornwall, could convey meteorological information to distant parts of Britain. That Admiral Fitzroy had supplied, for £4 each, a good barometer to thirty-three of the poorest, exposed British fishing villages." On the 26th June, the well-known "J. O." in the *Times*, stated that twenty fishing-boats had been lost recently, with all hands, on the Norfolk and Suffolk coasts, whereby 180 men had perished, leaving widows and children destitute.

On the 6th September, 1860, meteorological reports were published from fourteen places, and by telegraph from twenty-five places, respecting wind and weather. Shortly afterwards, the *Times* reviewed Admiral

Fitzroy's manual called "How to Foretell Weather," and published it in complete form, as a work of public importance. On the 11th February, 1861, the same journal recounted in one column the account of a north-east gale, and stated, "All the much frequented parts might have been warned three days before the storm. The late storm might have been predicted with as much certainty as an eclipse, and could have been announced by signals as conspicuous as fiery beacons, as all points of our coasts are connected by telegraph wires, and there can be no difficulty in showing signals. We think it highly desirable that the system should be established without delay. The destruction of human life and property on these occasions is so appalling that we cannot keep the subject too constantly before the public. Seamen do but share the common failing in neglecting the warnings of the barometer. These warnings have now been so deeply studied, and the information obtained has been reduced to a shape so practical and beneficial, that it would be deplorable if such advantages were thrown away. If some ports can receive timely information of a tempest, all can be similarly warned, and information should be published respecting the attention paid to them." On the 30th June following the *Times* stated that the general opinion was that the weather reports were valuable, and remarkable instances thereof had occurred. The same journal, on the 11th of April, 1862, observed, "The success already attained, and the practical good effected, justified the allowing Admiral Fitzroy to continue his experiments at the moderate cost they occasioned, for the storm drums obtained the faith they deserved, for seamen would no more like to go to sea when they were hoisted than on a Friday. He merely warns of danger—'look out; be on your guard; see to your glasses.' He has saved many fishermen's lives, and disseminated the knowledge of the use of the barometer. Even as a rain-prophet he need not be discouraged." There were some opponents and critics who doubted entirely the utility of the system, and amongst them may be named Mr. A. Smith, of Scilly, late M.P. for Truro; while other persons believed that the new system was partially beneficial at least, and would become more so.

According to the *St. Leonards Gazette* of the 3rd May, 1862, during the preceding months of March and April, out of Admiral Fitzroy's 59 predictions, 23 were successful; his opponents suggested that the law of chances would have used him better, but they should have remembered the assertion of Cicero, that he who has once predicted truly has a legitimate title to be deemed a prophet. Besides opponents, one of whom even in the year 1859, feared he would "not do much for the science of meteorology, being deficient in the elements, and on the subject of vapour in the air entirely befogged,—yet in search of the truth,"—sometimes he had to contend against anonymous triflers, whose false notices he contradicted, as upon one occasion, when official notice had been given from Lisbon of a severe storm to occur between 8th and 18th December, 1864, when the fishing boats returned in such alarm and haste that the nets were left at sea. Irrespective of this testimony to the credit which his system had obtained, I may select the following published verifications, amongst others not enumerated:—

Shields, 23rd February, 1861.—After the telegram of 21st, a storm signal was hoisted, when a very considerable fleet remained in port. About midnight, a hurricane of wind came on with a torrent of rain, and it continued to blow great guns for several hours.

13th March.—The signals at Liverpool arrived almost daily, and many maintained that the warnings of danger were of unquestionable benefit, resulting eventually in the saving of a great amount of life, and valuable property.

Shields, 19th March.—Furious gale followed a warning.

Shields, 11th January, 1862.—To-day we have another

storm signal hoisted, indicating dangerous winds from the north. There is every prospect of a bitter night, as the wind chopped round nearly to the north, a severe gale threatening to increase in violence.

7th August, 1862.—Soon after the storm signals had been hoisted at the harbours and headlands of the British coasts on the 6th instant, the weather became unsettled, and there has been a succession of terrific squalls with torrents of rain.

October 13, 1862.—The storm signal had not been up for many hours before squalls broke over the coasts with much force. The signal to the seamen of the Tyne was "Look out for squalls." On the 17th another signal was followed by a similar storm, with sleet and rain. On the 12th, 13th, 17th, and 20th, signals were shown. On the 22nd, an alarming gale raged over London; and on the 19th of the month also at Yarmouth, rendering the masters of ships cautious in making all snug. Scarcely any part of the coast escaped the fury of the gale.

At Shields, on 23rd October, no sooner had the storm warning appeared, than the wind commenced to blow in heavy squalls. Some colliers would go to sea. Again, on 20th December, a gale burst on the coast immediately after the signal. In January, 1863, at Shields, early in the month the signal was followed by a storm, and at Swansea, on the 24th, another storm followed the signal. The same at Shields, where, on 14th May, a storm followed the signal again.

On 23rd July, 1863, the herring fishing boats took shelter in Whitby, having attended to the warning, which was followed by high wind. On October 1, at Shields, a gale followed with rapidity the storm warning.

On October 16th, along the coast of West Cornwall, the storm of 12th and 13th raged with violence. A few shipping casualties occurred, but, "thanks to Admiral Fitzroy, and to those who have learnt in the school of experience, the smaller craft have found that forewarned is forearmed." Signal was hoisted the day before.

On October 30th, at Cardiff, the signal was followed by gales, continuing all day and night; also at Edinburgh, and elsewhere.

On November 1st, at Portsmouth, and again on the 4th, the signals were followed by dangerous winds. Signals for three days. "Internationally, there was then regular meteorologic correspondence from France, as soon as from Ireland and Scotland, at 10 a.m., when Admiral Fitzroy's notices arrived in Paris. The gale of the 1st and 4th November were signalled on the north and west coasts of France, and the west coast of Europe, in good time," wrote the Admiral on the 7th November.

On December 1st, at Shields, the signal of dangerous winds from opposite quarters, and on the 6th, at Portsmouth, the warning signals, were speedily followed by gales. On the 3rd, Mr. Thomas Plant stated in the *Times*, "the warnings of dangerous winds from opposite directions have been this week truly carried out in the results."

On 8th December, a great gale in the north of England was pointed out by the forecasts, and the director of the Paris Observatory mentioned the services rendered by the meteorological department carried on according to Admiral Fitzroy's principle.

In 1864, at Shields, on 11th January and 22nd January, and in North Lancashire on the 12th and 13th February, gales followed the hoisting of the signals there. In 1865, on the 11th January, at Shields, the storm-warning was followed by a gale, and again on the 22nd a similar result followed. In February, on the 13th, the west coast of North Lancashire was visited by gales, according to Admiral Fitzroy's telegram; and on the 15th a similar result followed at Portsmouth, where it was suggested that the signals should be repeated by means of the coastguard, as they would be of the greatest benefit to our mercantile marine, even at sea.

From Admiral Fitzroy's death, on the 30th April, 1865, until the 7th December, 1866, the signal and forecast system was continued at intervals with great skill by Mr

abington. During the last month of its existence, on the 7th, 12th, 22nd, and 29th of November, the cautionary signals were followed by storms and rough weather at and near the places warned. On the 3rd and 6th December, similar results followed the warnings, when they ceased by order of the Board of Trade.

Mr. A. J. Pearce, author of "Astronomic Meteorology," seemed the Admiral to be successful in forecasting storms: 4, 48, or even 72 hours in advance, but on the approach of a northern gale the mercury does not fall, hence in such cases the warnings were too late, yet frequently useful to fishermen and coasting vessels. The Admiral admitted to this author, in the year 1864, that, believing the moon to be a great disturber by gravitation, while the sun is by heat chiefly, he was so far a lunarian, but he did not believe in astronomic meteorology. He believed a forecast to be the expression of probabilities and an experimental process, not a dogmatic prediction, and that some gales, especially from the north, came on suddenly and without warning, while in other cases the warning would extend over a space of several days. With respect to this remark, it should be remembered that fifty warnings, of 72 hours each, would extend over the whole winter, as the Committee have stated in their Report.

An Edinburgh critic of the forecast system stated that out of nine telegraph warnings sent there in October and November, 1864, only one arrived before the storm began, and one was a mistake. He was of opinion that if our station-masters desired to make genuine forecasts they must have two-hourly telegrams, sent directly from the west coast of Ireland, to be compared with their own barometers, although Iceland or the Isle of St. Kilda would be better, as in Britain we are too close upon the Atlantic to forecast storms for days before they arrive. He adds that Admiral Fitzroy's system, imperfect as it was, well deserved the expense of carrying it out. The fluctuations of the barometer were watched before boats put to sea. The hoisting of the drum had taught our sailors the value of meteorological science, and, so far, the practical fruits of the system were realised, which might be extended by means of the Atlantic telegraph. The *Daily Telegraph* of October 22, 1862, gave Admiral Fitzroy credit for having predicted the storm of 19th October, when the gale raged during the night with the energy of a hurricane:—"Yet, in the face of his 'cone,' hoisted apex downward, the Shields' colliers coolly put out to sea! It is impossible to deny that the Admiral's storm-cone has sometimes been hung peak uppermost when the provoking wind has come from the southward, and *vice versa*. Can nothing be done then—has science nothing to say? Unforeseen disturbances, data not allowed for, may upset his calculations; but, as the field of meteorological inquiry is widened, and its deductions fortified, a very high degree of certainty will be obtained." The report of the committee upon the subject tends to confirm this idea.

In an explanatory note in the *Times*, 20th June, 1864—which journal, on account of the character of the science, if it could be founded, was disposed to make every allowance for the special cause of any occasional failure—which had brought discredit on his prophecies, Admiral Fitzroy disclaimed the title of prophet—"for they are not predictions." Forecast he deemed applicable to such an opinion as is the result of scientific combination and calculation, liable to be marred by an unexpected down-rush of south wind, or by a rapid electrical action, not yet indicated to our limited sight. He explains, further, that inland situations are not affected by winds like the sea-coasts, Liverpool feeling chiefly the north-west and south-east winds; but the valley of the Severn is exposed to south-west and north-east winds. North-east winds are difficult to foretell, as the barometer rises before they blow, even with rain, and at such times the thermometer is a good guide. But in practice, many dynamic chemical and electrical considerations are indis-

pensable, even for 48 hours, and on his barometers supplied to fishermen, these words were endorsed:—

"First rise after very low,
Indicates a stronger blow."

In the Report of the Committee, and in the letter contained therein, dated 15th June, 1866, written by the President of the Royal Society, the great value of the storm signals was recognised, for out of 56 opinions given in 1862 by shipmasters, 46 were favourable, 3 unfavourable, and 7 were neutral. From 1st April, 1863, to 31st March, 1864, 2,288 signals were hoisted, of which at least 1,188 were justified by the state of the weather when the message arrived or within 48 hours afterwards. That is, as to force of the wind, but with respect to its direction, about two were correct to one incorrect. Of the cautionary signals, between 1st April, 1864, and 31st March, 1865, out of 40 cases, 29 were successful, 8 failed with respect to force or direction, and 3 were late, being a decided improvement of the system. The following certificates, given in 1866, likewise testify to the value of the system:—

Aberdeen Marine Board:—"The utility of the signals was acknowledged, and the subject obtained more attention, they having been accurate for a considerable time."

Dundee Local Marine Board:—"Very generally appreciated; the correctness being a matter of common remark."

Shipowners' Society, South Shields:—"Of much practical value."

The Pilots, South Shields:—"Of great importance and practical value."

Mercantile Marine Office, Sunderland:—"Decidedly valuable. More correct than formerly."

Collector of Customs, West Hartlepool:—"More trusted by seafaring men."

Receiver of Wreck, Great Yarmouth:—"They are watched by seafaring men, and have improved in accuracy."

Collector of Customs, Deal:—"They have saved life and property to an immense extent."

Local Marine Board, Plymouth:—"Not in any great degree of value."

Mercantile Marine Association, Liverpool:—"Decidedly in favour of their continuance."

Local Marine Board, Liverpool:—"Very valuable; amount of accuracy has increased."

The committee, in their report, explained the manner adopted for making the forecasts, but the practice did not seem to be carried on according to definite rules, nor did the maxims appear founded on any sufficient induction from facts, the data not being enough for an accurate test; moreover it is difficult to compare the forecasts of one period with those of another. As a rule, they agree neither with each other nor with the storm warnings, and we do not know, the committee states, what weather will prevail during the next two or three days, and when a storm will occur. No good reason appears why a government department should issue them. With respect to the storm signals, the success has been greater, and, so far as they indicate the force of coming gales, they have been of some use, and their utility is widely admitted. They have improved, and probably are capable of greater improvement; but, with respect to the direction and force of coming gales, the warnings were not sufficiently correct to be useful. Ninety-five barometers had been supplied to fishing villages, when the committee issued their report, with instructions respecting their utility. The committee recommended that the system of telegraphing the weather be continued, but that the daily forecasts be discontinued; that the practice of issuing storm warnings be continued, but that no statement be made respecting the probable direction of the wind, nor warning issued unless the gale is expected within 48 hours. They credit the late Admiral Fitzroy with zeal and perseverance in establish-

ing the highly-prized systems of storm-warnings, and it will not be forgotten that he gave the first impulse to this branch of inquiry, and indeed men of science and the public to take part in it, and who sacrificed his life to the cause which others may hope to advance.

In effect, since 7th December, 1866, the system has been postponed indefinitely, until the science of meteorology shall have been sufficiently perfected in the opinion of scientific men to justify its reappearance on the scientific stage, to receive, doubtless, a cordial welcome. Meanwhile, how about the fisherman's boy, and the three,—or it may be thirty,—or three hundred fishers who, in the absence of caution and of knowledge—the staff of mental life—may go out to meet death in the deep, deep sea? Shall the stormy winds “blow, and crack their cheeks”—with Death ready to launch his dart—at the victims, while we have a Greenwich Observatory, and many other observatories, a Royal Society, and other societies—a body of scientific men, and a Government with money—all looking on, and grasping at the shadow, while the substance is perishing for lack of the knowledge which, even now, these “masters in Israel” or guardians of *Salus Populi*, may be expected to supply? To quote the language of the *Daily Telegraph*—“Can nothing be done, then? Has science no good word to say for these gallant men and good ships (half of which are composed of colliers) to be caught in mid-course, and ‘whelmed in the briny ocean?’” The language, also, of the Royal Society's Secretary should be remembered:—“The proper test of the efficiency and usefulness of a system of cautionary signals at the different ports, is to be sought in the measure of utility which it appears to have attained; always remembering that the system can only be regarded as in its infancy; and its improvement, and, consequently, its importance, may be expected to be progressive from year to year.”

The value and practical nature of the storm signals have been shown, and either in their original, or in a modified form, they should not be discontinued for twenty-four hours. But such discontinuance having occurred, it is suggested that, as is now the case at Kingstown Harbour—and perhaps elsewhere—the hoisting of a cautionary signal at each of our chief ports might be undertaken irrespective of the Government, as an affair of local management, temporary, and subject to local superintendence. For instance, when the barometer, which generally indicates the advent of great and dangerous storms, falls below 30in., and at a certain rate, say 3-100th an hour, a cautionary signal might be raised, and one of danger whenever the barometer falls at the rate of 5-100ths of an hour in all cases; the nature of the signals to be a question for future settlement.

Under present circumstances, it is submitted that a plan of the kind just mentioned by me would be respected by nautical people, and tend to preserve life and property, especially if such signals were shown by day and by night, if required, by means of lanterns, for it was Admiral Fitzroy's idea, that, in the case of warnings arriving after 3 p.m., they should be shown until late at night. Explanatory rules, if necessary, should be circulated. A writer in the journal which chiefly advocated the signal system, and which proved its national value, inquired, during a discussion upon its merits, “of what use is it to continue to read the barometer to the one-thousandth of an inch, and the thermometer to one-tenth of a degree, year after year, without the practical result gained by Admiral Fitzroy?” This question may now be fairly repeated; and it is for the Society of Arts, to whom I tender my thanks for allowing this discussion, as well as for those gentlemen present who understand the practical bearings of the subject better than I do, to consider the question herein offered for their earnest consideration, and to give independent opinions without favour and without fear—opinions which shall not be

confined to this room, but shall be read far and wide, so as to show to the nautical classes of Britain that their welfare is not an object of indifference to the Council and members of this Society.

It has been stated recently, in the House of Commons that in consequence of memorials from various seaports, including Liverpool, the Government has offered a supply telegraphic signals upon a request being made for that purpose, the expense to be defrayed equally between the contracting parties; yet, it may be that, bearing in mind the contingencies incidental to a Government, the system for the present at least would thrive better if carried on irrespective of governmental patronage and aid. Probably, with respect to this part of the question, differences of opinion may be expected to prevail.

DISCUSSION.

Admiral OMEARNEY said he had heard the paper read with great interest, and he thought it a most valuable one in every point of view, practical and scientific. He trusted that the system adopted by the late Admiral Fitzroy would be resumed; at the same time he thought the department of the Government under which the system was carried out only went half way in what was required. There was, no doubt, great utility in the telegrams that were sent to the coast as warnings to the fisherman, masters of trading vessels, and others who had not received a scientific naval education; but another department was required, devoted to the physical geography of the sea, like that which was instituted by Lieutenant Maury in the United States. We had at present very little knowledge of the motions of the sea, the temperature of the ocean, the currents, &c. We required a department to give special attention to these subjects, and if the results of the researches were tabulated and published, ships would approach our coast with greater caution. The loss of life and property in vessels coming to our shores was probably not greater than that which occurred in vessels outward bound. He concurred with the opinions set forth in the paper, and he hoped they would have the full consideration of the meeting. He was decidedly favourable to the suggestion that barometers should be more extensively furnished to the places on the coast, inasmuch as during the period in which he acted as deputy-comptroller of the Coast Guard he had frequent opportunities of witnessing their utility, and he considered this one of the most practical measures that could be adopted. He thought it very advisable that a regular system of barometric observations should be carried out by the local authorities on our coasts.

Mr. ROBERT WILSON remarked that the system of storm signalling carried out under Admiral Fitzroy was, he supposed, instituted by the Government for good reasons, and he was at a loss to conceive on what ground they had been induced to discontinue it. If it had been an entire failure, that would, of course, be sufficient ground for its discontinuance; but the Board of Trade, who of course kept records of everything that was done in this matter, had failed to show that the proportion of correct forecasts to those which had failed was such as to justify them in giving up the system. If the Royal Society and the Board of Trade had finally resolved to have nothing more to do with it, he considered it was to the interest of the local authorities in the various seaports to take it up for themselves, in the way which had been suggested in the paper. Various systems had been alluded to on which weather prognostications might be made; but to foretell the state of the weather was one thing; to foretell storms was another. The approach of a great storm was generally indicated by the action of the barometer. He had been in the habit of watching that instrument very closely, and he could say he never knew an instance where the mercury fell half an inch per hour without a great storm following. It might not

appen immediately upon the fall of the barometer, and alternate fall and rise might go on for some time, till some persons might imagine the storm had passed over. But it was sure to come at last. He had noticed that in several instances. He thought the barometric changes were closely studied, every man might be his own weather prophet. He considered these observations might be carried out by local bodies without the necessity of the Board of Trade distributing expensive telegrams. If, however, the feeling was in favour of a central establishment, such an institution as the National Life-boat Association might employ some one conversant with the matter to telegraph to the coast, as the late Admiral Fitzroy did. Mr. Wilson concluded by making some suggestions for what, in his opinion, would be a more perfect system of lettering the barometer scale.

Capt. J. SELWYN, R.N., said that as in many climates with which he was acquainted the barometer did not rise and fall at all, as in others there were a number of different circumstances affecting the heights of the mercury at which the change from "fair" to "foul" took place, all empirical rules must be applied with reference to the special locality alone to which they were adapted. We need go no further than our own Westmoreland to find an abnormal state of things in this respect, and too much attention could not be given to this point. Admiral Fitzroy had done well in changing the marks on the barometer; he had certainly introduced a much better system. Anything which could mitigate the dangers of the sea was worthy of any amount of scientific inquiry. If one single life were saved, he maintained that the whole of the time and money spent would be well employed. At the same time he was not on the whole displeased that the Board of Trade, as a department of the government, and that the Royal Society, as a great scientific body, should have severally declined to continue to deal further with this question of storm signalling, for, in the case of the Royal Society, its funds were not subscribed for such objects, and in the case of the Board of Trade we had daily experience of the inefficiency of Government to deal with such matters. There were large money interests concerned in this question, and there were the association of Lloyds, and the maritime insurance companies, who might co-operate in carrying out such a system more advantageously than could be done by any Government board. It was asserted that, in many cases, the storms predicted by Admiral Fitzroy did not come, while others came unpredicted; therefore, it was argued, that no reliance could be placed upon such a system of prediction. Was there any new science that had sprung up which, within so short a time, had accomplished such important results with so few failures? Amongst the various reports upon this system quoted in the paper was one from Plymouth, which was not favourable, among many that were favourable, to the utility of the system. On that point he would observe that, as many storms touched Plymouth first, owing to its position, it was extremely probable that a signal which might prove of the utmost value on the north and north-east coasts would be of but little value at Plymouth, because it could not be sent in time to be of any avail. He was happy to see that the secretary of the Royal Society had given such admirable testimony to the truth of the principles which the Society declined to follow up—not because it did not take an interest in them, for that could not be supposed for a moment—but because it was not its province to deal with the matter practically. He would conclude by expressing a hope that this subject would not only receive special attention from scientific men, but would also receive money support from the public, who were so largely interested in the question.

Mr. VARLEY considered the great number of valuable lives which the system of storm signalling had been the means of saving was a sufficient justification for its continuance, and this could only be done efficiently by a

complete system of telegraphic communication around the coast.

Mr. MAYER considered the arguments on this subject had not been put upon a fair basis. They were asked to discuss whether or not the system of storm signalling ought to be continued. His own opinion was that the Board of Trade, having organised a system of that importance, would not have given it up without strong reasons for so doing. It occurred to him that one reason why it was given up arose from the apathy with which the signals were regarded by seamen.

Captain TORNBURGH said that although he had accepted the appointment of Marine Superintendent of the Meteorological Department, with the object of obtaining more extended meteorological information from the sea, he had nothing to do with the issue of storm warnings, and wished it to be understood that the views he might express on this subject were those of a private individual, and not put forward in an official capacity. As a sailor he had naturally given a good deal of attention to the forecastings of the weather, and it had always struck him that the air which forms our south-west gales was that air which had come over the north-east trades into our latitudes, so that the weather which was first experienced in the south-west of Ireland would subsequently be the weather on the north-east. Therefore it seemed to him that something in the way of foretelling storms might be arrived at. For instance, supposing they took Valentia, then Greencastle, and Nairne, to the north-east, if telegrams showed that a depression had taken place at Valentia, a short time afterwards at Greencastle, and later still at Nairne, this would tend to show that a gale was travelling from the south-west. He drew a diagram, showing how these curves might be recorded for comparison, so that those for a month could be seen in juxtaposition. If these curves did not run parallel during gales, there would be reason to doubt the theory, and another classification of the ports might be taken—say, from south to north, or from west to east. He explained that the same diagrams might be used for temperature, direction, and force of the wind; but for exactness in this work better records were needed than could be collected from men not used to the work, without anemometers and wind vanes.

Mr. F. GASTER said, in witness of the measure of success which attended the labours of Admiral Fitzroy, he might bring forward the reports given in the paper read by Mr. Cooke; the absence of complaint from the different ports of the United Kingdom of the insufficiency of the signals; and last, though far from being least, he might refer to the very severe test which the system experienced at the hands of the committee of the Royal Society. Under those circumstances he thought the success of the system was undoubted. The Board of Trade requested the Royal Society to give their opinion as to the desirability of continuing the system, and the result was that the meteorological department was handed over to that society, which was the first scientific body in the country; and they were at perfect liberty to decline to carry on a system which they considered to be founded mainly on empirical rules. On this the Board of Trade declined to take the responsibility of continuing the storm signals, but what they proposed was that telegrams from various parts of the country should be collected and sent to the outports. He (Mr. Gaster) thought that method would be more efficacious than storm-signals sent from a central place to the various outports. He thought, if the telegrams were sent as proposed, that diagrams should be exposed to public view, showing the direction and force of the wind, together with the height of the barometer at each place. With such diagrams anyone could form his own judgment from the observations thus put before him. All persons present were aware of the very determined manner in which Admiral Fitzroy laboured to perfect his system of signals, but that there were failures occasionally could not be doubted. Con-

sidering, however, the difficulties that had to be experienced in any attempt of this kind, he thought the success attained was decidedly remarkable.

Mr. R. STRACHAN, as a meteorologist, and having studied the writings of Admiral Fitzroy on this subject, had come to the conclusion that the system was founded upon principles which had been best enunciated by Dr. Buys Ballot. It was impossible, however, under rules so vague and undefined as those which existed, to ask the Royal Society to undertake the task of predicting the weather. If definite rules, like those which guided the periods of eclipses, the rise and fall of tides, &c., were discovered applicable to this branch of meteorology, then he thought the Royal Society might fairly be asked to carry those rules into practice; but not otherwise. That Society having declined to take this task upon itself, a reasonable excuse was given to the Board of Trade for having adopted the same course.

Mr. PEARCE, as one who took great interest in the science of meteorology, was decidedly of opinion that the system of storm signalling should be resumed, although he thought it could not be carried out successfully without a central gathering power. It was no use to have different stations on the coast of England without a central collecting body; and when they saw such large sums contributed to the National Life Boat Association for the saving of human life, he thought the system of signalling to prevent men from imperilling their lives on the sea was a question of equal importance. With regard to the adverse criticisms that had been made by the public press and meteorologists on Admiral Fitzroy's predictions and storm signals, he thought it would be agreed that nothing had been advanced sufficient to deter them from the resumption of a system from which much good had resulted. With respect to the rules of Admiral Fitzroy being vague, that was the chief objection raised by the Committee of the Royal Society; but it was to be remembered that this had been the state of all sciences in their earlier stages. He thought those laws which were now regarded as empirical ought not to be wholly disregarded, seeing that they were applied with so much success by Admiral Fitzroy.

Mr. W. H. BONNEWELL argued, on the question of the utility and public importance of storm signals being continued by the Government, that if they were of the importance and reliability pointed out by the advocates of the system, an organisation like that of Lloyd's underwriters would be the first to adopt it for their own pecuniary interests, without waiting for any movement on the part of the Government. Under the circumstances, he thought the Government were justified in withholding their sanction to the expenditure of the public funds for carrying out these experiments.

Mr. LOCKMART called attention to the fact that from the Imperial Observatory of Paris there was every morning issued, by the head of that institution, the celebrated M. Le Verrier, a sheet map of the whole of Europe, on which the directions and forces of the wind on the previous day were recorded. The temperature and other circumstances of the weather were also given daily in that form. Seeing that these records were sold at a considerable price in this country, the question suggested itself to his mind whether something of the same kind might not proceed from our own Royal Observatory at Greenwich?

The CHAIRMAN, in closing the discussion, said it had been generally admitted that the storm signals of Admiral Fitzroy, communicated to the various outposts, had, to a considerable extent, been successful, and had, most probably, been instrumental in saving a large amount of life and property. With regard to the frequency with which they were correct as storm signals only, he held in his hand an extract from the report of the Committee, which had inquired very carefully into the subject. From this it appeared that of a total number of 405 storm warnings for the three years from 1862 to 1865, in the first year 80 per cent. were correct; in

1862-64, 68 per cent. were correct; and in 1864-65, 75 per cent. were correct. With regard to the direction of the wind, only 38 per cent. were right, and 62 per cent. were wrong. It therefore appeared that in the three years, about 75 per cent. of the storm warnings were correct. Whether scientific—whether empirical or not, was it not, at all events, a matter of prudence—a matter of humanity—not to hesitate about the continuance of such warnings? And yet they had been discontinued—and upon what grounds? There were scientific data—this was to say the results of observation; but it was alleged they were not sufficiently numerous or extended to enable a scientific man to arrive at definite results. But this was surely no reason why they ought not to continue these warnings which had been productive of so much good. After all, it could not be said that the science of meteorology was only just now in its infancy. He recollected Humboldt, who was his (the Chairman's) master, giving meteorological data at the end of the last century, laying down normal conditions which, for the tropics, to a certain extent, were good. The Greenwich Observatory had records for half a century, made by scientific observers, and with the most carefully constructed instruments; and the same had been done by other bodies, such as the Cambridge, Oxford, and Edinburgh Observatories, to say nothing of the meteorological societies that had grown up within the last 20 years. There were as many as 72 regular observers in Scotland alone, and he believed about the same number in England. So far from not having sufficient observations, the difficulty was that they had too many. The truth was, however, that these observations had been made independently: they had not been brought together and compared. There had been no attempt to deduce normal conditions from the multitudinous observations made. It was not that they now wanted new stations to give them observations with self-recording instruments. If fifty years were not sufficient, how long were they to wait till they could use the results of these observations? Would the next six years be sufficient, when the last fifty years had not been so? As he had already said—these observations of Admiral Fitzroy produced a certain amount of good. As to the direction of the wind, no doubt they failed to some extent, but this could be explained on scientific grounds, into which he would not now enter. Capt. Toynbee had stated his views to the meeting, and these were in truth the very principles on which Admiral Fitzroy had acted. He (the Chairman) had always advocated extended observations not confined to localities. The British isles were far too restricted an area in which to obtain definite observations as to the conditions of atmospheric changes. The origin of these changes was far beyond that area. The great wave of pressure last year came from Shanghai, in China, where the barometer was at 31 inches, gradually progressing towards Europe, and travelling to America in a period of about seven weeks, as far as Montreal, when the barometer stood at 30 inches there. These were indications of atmospheric movements not over a space of 600 miles, but over the vast space of 16,000 miles. On the other hand, he had known instances of as great atmospheric disturbances as that he had mentioned occurring within so small a distance as 200 miles, in India. He had known the barometer to stand at 20 inches at Malabar, while at Coimbatore, only about 100 miles distant, it was at 30 inches. As he had said, he had always been an advocate for international observations, and he fully appreciated what was done in that respect in Paris by M. Le Verrier, as mentioned by the last speaker. Those daily bulletins were of the greatest scientific value. But this was not done in France alone, but was carried out throughout the whole of Europe—in Berlin, in Italy, in Holland, and in Russia an organised system of observations prevailed. He had a letter from the Secretary of the Meteorological Society of Scotland, expressing his deep regret and that of the

shermen along the coast at the discontinuance of these storm signals. With regard to the daily meteorological observations published in the *Times*, he would say it required the experience of many years, and a considerable knowledge of meteorology, to be able to turn them to any practical account. With regard to the cost of carrying out the new system proposed, applying it to such a place as Leith, it would amount to about £60 per annum, half of which the Government offered to pay, but the town of Leith refused to pay the other half. It was suggested that an expert might be engaged at each station at £20 per annum, though what kind of expert could be had for that salary he was at a loss to conceive. This would bring the cost of the several stations proposed to about £1,600 per annum for the twenty daily communications, out of the pocket of the country. The establishment had already cost £10,200, in addition to £2,500 at starting. Observers in England would be aware that, circumstanced as we were with regard to the Atlantic, the wind blew from a westerly point 300 days out of the 365 days of the year; therefore, as far as England was concerned, we had the advantage of that normal condition apparently. It was remarkable that with a westerly wind, which came from a dry climate—such a one as we had had during the last week—the barometer stood very high. The wind gradually rose till it amounted to a gale, and there would be no indication of it on the barometer. That was also the case with the wind from the north; but with the winds from the other points of the compass, they had not that difficulty, and there was a greater chance of safety in the predictions. Considering the advantages which had already resulted from the storm signals of Admiral Fitzroy, and the practical inutility of the proposed system of observations confined to a few stations, he could not but hope that the Council of the Society of Arts would take the subject up, and express their opinion on it to the Government. The council of the Meteorological Society of Edinburgh had already done so, and they would see in a few days returns on the subject which would be published as a parliamentary document. Those returns would be made from Liverpool, Dundee, Edinburgh, Manchester, and many other places, and they would find there was an almost universal feeling in favour of the continuance of the system of storm signals. The Chairman concluded by moving a vote of thanks to Mr. Cooke for his paper.

The vote of thanks was then passed and acknowledged.

PARIS UNIVERSAL EXHIBITION.

Scarcely four weeks separate us from the opening of the exhibition, and every day exhibits signs of increased energy and advancement. It will be satisfactory for those at home to know that the British section is not in arrear of its neighbours, in fact, taking everything into account, perhaps the English portion is more advanced than any other, with the single exception of Russia; the slow conveyance of goods from the coast is apparently the only circumstance which prevents still more rapid progress. If this be altered, there is little doubt that the British machinery court will be completely arranged by the opening day; if not, there will probably be large gaps, for which the French railway will be responsible. Unfortunately, this railway difficulty tells specially against England, the channel ports being invariably choked up when there is any important addition to the ordinary work.

The fears and doubts that have been expressed regarding the opening of the exhibition, or the condition in which it will open, never had foundation in fact. It was always intended that it should be opened on the 1st of April, and I do not imagine that it was ever for an instant contemplated to make any change in that respect.

The condition of the building is of course an important element in the case, and it is but fair to the Imperial commission to say that not only the stone and iron work, but also the glazing, painting, and flooring were all completely finished to time, that is to say, the progress of no portion of the exhibition has ever been impeded by the workmen engaged on the building itself; and to this fact may be added another, namely, that the floor is substantial and well laid, thus presenting a striking contrast with former exhibitions.

The grand vestibule is now being paved, and is probably finished at this moment, and before long its clerestory windows will be filled on one side with French, and on the other side with English stained glass; this vestibule forming the demarcation between the two countries.

Thanks to the change in the weather, the grounds are much improved in condition, and the main roads are becoming firm and hard; moreover, as the heaviest traffic is taken by the service railway, the roads have a fair chance of becoming consolidated. The service within as well as without the building is of immense use, and at the present moment there are three steam traversing and other cranes at work in the British department alone.

Even should the dry weather not continue, those who visit the Exhibition may now do so with perfect ease; the roofs forming the carriage entrance on one side of the grounds are completely finished, with the exception of decoration, and the roads beneath laid with asphalt, so that the entrance way is perfectly sheltered. The covered way, on the opposite side of the grounds, for those who arrive by railway, is also nearly completed; but the branch railway is not yet thrown open for passenger traffic, probably for fear of interrupting the goods service.

The further the preparations proceed the greater is the contrast between the British and the other portions, and especially the French section, of the exhibition; in the latter, not only are nearly all the courts covered with awnings, but the whole of the main avenues also, and that at no great height from the floor, so that the French and other industrial courts have the appearance of a series of narrow arcades, with back shops; in the English department, on the contrary, although a considerable number of large cases and stands are erected, they do not hide each other, and each has some distinguishing feature. But the course taken with regard to sun-blinds has produced a still more marked contrast. There will scarcely be any canopies in the whole of the English section, and instead of awnings, the Commission is placing a blind beneath each of the lights in the roof. These blinds have a small diaper pattern, and an ornament in the centre, containing, alternately, the insignia of the three kingdoms, of India, and the colonies, and, being carefully stretched and fixed to the woodwork, have a very neat and finished appearance. The awnings in the other portions of the building are, at present, brilliantly white, with gay coloured borders, while the English blinds seem to be unbleached; but, while the former offend, the latter please the eye. Thus, the whole British department is not only as free and open as possible, or nearly so—for there is one long wooden wall which interferes with the rule—but the ventilation is left without the slightest impediment overhead, an advantage which visitors will certainly appreciate highly four months hence.

Art manufacture promises to be better represented than usual in the British department. Besides the English house in the park, and the reproduction of portions of the South Kensington Museum, the progress of which attracts great attention, the terra-cotta columns of the building which is to surmount the boiler-house are now being erected, and look very graceful; and the art-manufactures court is taking shape under the care of Mr. Wood. There is no doubt that the specimens of ecclesiastical and general decoration will reflect credit on this class of exhibitors, amongst whom are the well-

known names of Blashfield, Pulham, Hart and Son, Harland and Fisher, Hardman, Jones and Willett, the Architectural Pottery Company, of Poole, Clayton and Bell, Maw, Skidmore and Minton.

The preparations in the Indian court are well advanced; the cases are all up and glazed, but they are sadly crowded, and even as they are there is said not to be nearly room enough for the collection.

The British colonies are also beginning to make themselves seen, under the care of Mr. P. L. Simmonds and some local representatives; but here the want of space is as usual the grand difficulty, and Australian natural history has migrated into the machine court. The birds are very beautiful, and would have formed such brilliant decorations elsewhere that it is a great pity to see them placed where they are. There is a want of fitness here which is disagreeable to the senses.

A musical section has been formed, and the art is to be represented from the triple point of view of composition, execution, and history. The following is the list of the committee for composition:—MM. Rossini, honorary president; Auber, president; Berlioz, Carafa, Félicien David, Georges Kastner, General Mellinet, Mermet, Prince Poniatowski, Reber, and Ambroise Thomas; Verdi and Gounod, secretaries; Lépine and Norblin, assistant-secretaries.

The ministers who are vice-presidents of the Imperial Commission, namely, the Ministers of State, of Agriculture and Commerce, and of the Fine Arts, announce officially that they will receive the members of the commission, and committees, jurors, and officials, foreign as well as French, on alternate Saturdays, commencing with the 9th inst.

Foreign functionaries must be presented by the commissioners of their country.

Fine Arts.

COLLECTIVE EXHIBITION OF INGRES' WORKS.—This exhibition is announced to open earlier than was originally intended, namely, on the 1st of April; and it is expected that a large number of the most famous works of the painter, especially those of his latter period, will be collected.

BUST OF THE LATE M. COUSIN.—The Emperor has commissioned Mr. Munro, the Scotch sculptor, to execute a bust of M. Cousin for the French Academy. Mr. Munro commenced the portrait of the deceased at Cannes, and took a cast of the face after death.

Commerce.

IMPORTS OF COTTON.—The imports of cotton last year were very nearly as large as in the great year 1860. Thus the receipts of raw cotton in 1866 amounted to 1,377,129,936lbs., as compared with 977,978,288lbs. in 1865; 893,304,720lbs. in 1864; 669,583,264lbs. in 1863; 523,973,296lbs. in 1862; 1,256,984,736lbs. in 1861; 1,890,938,752lbs. in 1860; 1,225,989,072lbs. in 1859; 1,034,342,176lbs. in 1858; and 969,318,896lbs. in 1857.

Colonies.

LAND TENURE IN NEW SOUTH WALES.—The eminent success (says a Sydney paper) that has attended the practice of free selection by small holders of land whenever the principle has been allowed unrestricted operation, has brought into greater contrast the desolating effects of the pastoral system as at present encouraged. The freehold cultivator converts his land into a productive garden, while the leasehold squatter suffers it to

remain, for all purposes but those of feeding stock upon the natural grasses, a dreary wilderness. The constant answer to reproaches of this kind is that the squatters would improve the land if the legislature would give them secure and perpetual possession; and strangely enough this one-sided mode of reasoning finds supporters in persons who ought to be amongst the first to perceive its hollowness and injustice. There is no reason whatever why the public land should be secured to the present occupants. For twenty or thirty years, in some instances, those lands have been shut up from general competition, and the time is fast approaching when the public will insist upon its termination. When that time arrives, the true wealth of Australia will, for the first time, become generally known to the world, and prosperous farms and a numerous contented yeomanry will occupy the places of desolate sheep walks and scattered and migratory adventurers.

LEASING OF LAND IN QUEENSLAND.—The Queensland Parliament have passed a bill called the Leasing Bill. A great bar against the occupation of land appears to have been the sum demanded by Government as purchase money—£1 per acre. The purchaser was also compelled to fence in all the land within two years from the date of purchase, if taken for agricultural purposes. The new leasing bill enables the man who desires to take up land for any purposes, to do so on easy terms, and the condition of fencing the land is no longer insisted upon. Many persons would have desired the introduction into the bill of a clause making the clearing and cultivation of a certain portion of land one of the conditions of leasehold. This, however, was strenuously opposed by the squatters, who also endeavoured to have fencing made a condition binding on the leaseholder; in this latter point, however, they were defeated. The bill is a compromise, the squatters having yielded to the agriculturists the right to lease land on easy terms, but they have, at the same time, taken care so to frame the Bill that they will themselves be able to make use of this liberality without being obliged to devote any of the land to agricultural purposes.

Correspondence.

THE CAB QUESTION.—SIR,—Referring to the paper read, and the letters that have appeared in the *Journal*, respecting the street cabs of London, will you allow me to offer a few remarks. First, with respect to the cab fare. When the fare was settled at 6d. per mile, the proper method was arranged for settlement of disputed fares by the establishment of a book of fares, published "by authority." Now, there is no doubt that this is the proper way of settling this difficult point; but no sooner was the book of fares published than "cabby" found out the wrong fares in the book, and employed his friends to ride about in his cab and pay him the fares according to the book. Cabby summoned the rider, and had the distance measured, proving the book wrong; and this was repeated in so many instances of mistakes in the book, and at so many different police-courts, that the magistrates said the book could not be depended on, and so it has remained practically useless since. Now, the principle is a sound one, and the best and simplest reference in case of a disputed fare; and, in any fresh legislation on the subject, the book should be made "infallible," in this way: Every care should be taken in its compilation, but a clause should be inserted in the act relating to cabs that, for all the purposes of reference in case of disputes, the book published "by authority," whether right or wrong, should for the time being be held to be "infallible" and past question, and magistrates and police should be bound to enforce its decrees. After six months it should be revised, and a new edition published, with all its errors rectified (if any), and so on as often as required, the latest edition to be binding

on driver and rider for the time being. Secondly, as it is doubtful if the present fare of 6d. per mile will be continued, the book should show the distance in miles and fractions of miles, carrying change of fare. If the legislature fixes the fare (although on this point I am rather diffident), perhaps a fair sum between the cabman and the public would be 1s. for one mile and under, 9d. per mile from one mile to three miles, and 6d. per mile for all distances of three miles and upwards, the extra persons to be paid for and luggage as at present; but decidedly the law should allow a better class of vehicles to be licensed to carry passengers at a higher fare, such fare to be at the option of the owner of the vehicle, who would fix a rate which, while it would pay, would also induce the public to engage and use these conveyances freely. It has always seemed strange to me, seeing the extent of our parks and the beautiful drives we have in the immediate vicinity of the metropolis on all sides, that we have not plenty of open carriages plying for hire, as they do in Paris, to convey people for a moderate sum to the various points of interest or beauty within an easy drive of the bridges or the parks. Thirdly. Now I come to the principal reason that induced me to write this letter. We all of us know what a noble street we have in Holborn above Middle-row and Oxford-street, and how completely it is disfigured, and, for purposes of rapid and continuous traffic, how entirely it is ruined by the string of cab-stands, cutting up a fine wide thoroughfare into two narrow streets, offending the eye with its rickety vehicles, the nose with its animal excretions, and the ear and the moral sense with its foul language. It is a disgrace to London that a cab-rank should be allowed to block up and hinder the traffic in its streets for a single day; and the remedy is so simple and so beneficial for all parties concerned—for the men, for the horses, and the cabs. They should be housed in stables, in the side streets, and kept manned and harnessed, only so many as required. The "waterman" should be stationed in the main street, in a box, with a red lamp lighted after dark, and a large number (the number of his station) printed on it. He should have an alarm communicating with the stables, and when a cab was wanted he should give, say, one pull for a four-wheeler, two for a hansom, and three for a superior vehicle; and, while the cab was coming, he should give a ticket with the number of his station to the hirer, ask him his destination, and, referring to his book, tell him the fare. In case of dispute at the end of the drive, the ticket would show the hiring-station. The whole arrangement should be placed under the care of the Metropolitan Board of Works, and the watermen should be efficient men, sworn in as constables, quite independent of cab-owners and drivers, and have a certain amount of control over them. There is no doubt that at present the cab-driver is dissatisfied, and the public is not well served, and therefore some change would be desirable for all parties.—I am, &c., A MEMBER OF THE SOCIETY OF ARTS.

THE GOVERNMENT AND THE TELEGRAPH.—SIR,—On the subject of telegraphy forming a part of our postal system, I hold nearly the same views as those set forth in the very able paper read last week by Mr. E. Chadwick. But there is one question of great importance, upon which (since it cannot be gathered from his paper) I shall, and probably many others will, be glad if that gentleman will state his opinion. Does he think that, either at the present time or in future years, it will be for the public benefit to prevent the dispatch of telegrams by private enterprise? or, in other words, would he wish the Government to monopolise the use of electricity for the purpose of conveying information of public importance, and of making our business or social arrangements? I cannot but think that any such monopoly ought not to be conceded; nor should we argue that because the post-office has given great satisfaction in its present capacity of administration only, it must be equally successful when it is called upon to

undertake extensive and varied duties of construction. At any rate, the Government telegraph is likely to be more efficiently managed, and the adoption now and hereafter of the quickest and most correct means of telegraphic communication will be best assured by there being no prohibition of wholesome competition on the part of private companies. If it is asked, "What chance will a private company have in competition with the postal telegraph?" the undeniable force of such a question supplies the best argument in favour of there being no monopoly, viz., if the Government telegraph always keeps up with the public requirements, and avails itself of the best systems, it will have nothing to fear from any competition. The commercial success of any private company, its property being subject to local taxation, &c., &c., could be brought about only by want of care and capacity for adaptation on the part of the Government telegraph free from such heavy imposts. The public can gain nothing, but may lose much, by giving to the Government a telegraphic monopoly. Another thing to be considered is, that if the public grants no such monopoly, it follows that existing companies will not be—as they ought not to be—compelled to sell their rights and properties; and, if the shareholders of the different companies are not pleased with the Government offers for their lines, they can, and probably will, amalgamate their interests, thereby greatly diminishing the annual expenses, whilst they augment the efficiency of their working arrangements.—I am, &c., J. HAWKINS SIMPSON.

March 5.

THE POSITION OF INVENTORS AT THE PARIS EXHIBITION.—SIR,—As there existed some doubts as to the position of inventors exhibiting at the forthcoming Paris Exhibition, a letter of inquiry as to certain points was directed to the Minister of Agriculture, Commerce, and Public Works, by my correspondent, Mr. Dufrené, at Paris, to which the following is (the translation of) the reply, which you will no doubt consider of sufficient interest for insertion in your *Journal*.—I am, &c., L. DE FONTAINE MORREAU, Patent Agent.

4, South-street, Finsbury, E.C., 26th Feb., 1867.

(TRANSLATION.)

"Ministry of Agriculture, of Commerce, and Public Works, Paris, 21st February, 1867.

"SIR,—I have received the letter which you addressed me on the subject, first, of the importation, in view of the Universal Exhibition of 1867, of articles manufactured abroad and protected in France by a patent; and, secondly, of the protection concerning the rights in the inventions of exhibitors. On the first point, it is certain that foreign manufacturers with patents in France, who wish to introduce similar articles for exhibition, must first apply for authority from my Ministry, pursuant to the law of the 31st May, 1866, in order not to lose their patent rights. On the second point, there has appeared to be no objection to proceed in a similar manner to that of 1855. In consequence, a Bill has been drawn up to authorize the delivery of Certificates of Protection, and there is ground for hoping that its adoption will not meet with any difficulty.—Receive, sir, the assurance of my consideration.—The Minister of Agriculture, of Commerce, and Public Works (signed), FORCADE."

MEETINGS FOR THE ENSUING WEEK.

Announcements by the Council.

ORDINARY MEETINGS.

Wednesday Evenings at Eight o'Clock:—

MARCH 20.—"On Successful Oyster Culture." By ARY LOBB, Esq.

MARCH 27.—"On Flax, and Improved Machinery for Preparation." By CHAS. F. T. YOUNG, Esq., C.E., Lab. Soc. Engineers, Assoc. Inst. N.A.

CANTOR LECTURES.

A Course of Lectures "On Music and Musical Instruments," by JOHN HULLAH, Esq., now being delivered as follows:—

LECTURE III.—MONDAY, MARCH 18.

MUSICAL EXPRESSION.—Definition—Difficulties of Musical Composition—Realization of Unheard Effects—The Perfect Cadence—The Renaissance—Imitation—Expression, False and True.

LECTURE IV.—MONDAY, MARCH 25.

MUSICAL NOTATION.—Different Systems, Alphabetical and Special—Neumas—Accents—Lines and Spaces—The Time Table—Modern Notation; its Origin and Growth, Simplicity and Fitness.

LECTURE V.—MONDAY, APRIL 1.

MUSICAL INSTRUMENTS.—Classification—Wind Instruments—Stringed Instruments—The Plectrum, Hammer, and Bow—Instruments of the Ancients—Medieval Instruments; their Introduction into the Church.

LECTURE VI.—MONDAY, APRIL 8.

MUSICAL INSTRUMENTS (continued).—Modern Instruments—Chamber and Orchestral—Combination—The Modern Orchestra—Conclusion.

The lectures commence each evening at eight o'clock, and are open to members, each of whom has the privilege of introducing one friend to each lecture.

EXAMINATIONS, 1867.

In addition to the prizes announced in the Programme of Examinations, the following are offered:—

The Worshipful Company of Coach and Coach Harness Makers offer a prize of £3 in Freehand Drawing, and a prize of £2 in Practical Mechanics, to the candidates who, being employed in the coachmaking trade, obtain the highest number of marks, with a certificate, in those subjects respectively.

The Worshipful Company of Goldsmiths offer three prizes—of £5, £3, and £2 respectively—to the three candidates who, being employed on works in the precious metals in any part of the United Kingdom, shall obtain from the examiners

the first, second, and next highest number of marks, such prizes to be distinguished as the "Goldsmiths' Company's Prizes."

SUBSCRIPTIONS.

The Christmas subscriptions are due, and should be forwarded by cheque or Post-office order, crossed "Countts and Co.," and made payable to Mr. Samuel Thomas Davenport, Financial Officer.

Proceedings of the Society.

FOOD COMMITTEE.

The Sub-Committee on Milk met on the 6th inst., at 10.30. There were present—Lord de l'Isle, in the Chair; Mr. Caird, Mr. Harry Chester, Mr. Clare S. Read, M.P., and Mr. Ludford White. The Committee settled the particulars of letters to be written to the following railway companies requesting information respecting the supply and transit of milk:—The Great Eastern, the Great Western, the South Eastern, the South Western, the London and North Western, the London, Chatham, and Dover, the London, Brighton and South Coast, and the Great Northern. Lord de l'Isle read a memorandum, drawn up by Mr. Sturgess, on the subject of cowkeeping for the working classes in the north of England; and communications on that subject were read from Mr. J. C. Morton, who was unable to attend the Committee, and others.

The Baroness Leisner-Ebersberg had sent a sample of "Liebig's Concentrated Milk for Infants," prepared for the "Infant Food Company" by Mr. Mullen. This preparation, she said, was stated by Professor Liebig to be a perfect chemical equivalent for woman's milk.

Various other matters were discussed, and the Committee adjourned to Wednesday next, at 10.30.

The Sub-Committee on Meat met on Wednesday, the 13th instant. Present—Mr. Harry Chester, in the Chair; Messrs. C. S. Read, M.P., E. Wilson, F. Parish, C. Wren Hoskyns, James Ware, and J. Ludford White.

Samples of a large quantity of Australian beef, preserved by Mr. Tindal, were laid before the Committee. It was stated that this was now on regular sale, at 7d. or 6d. a lb., according to quality.

The following memorandum, by Dr. Thudichum, on the use of "Liebig's Extract of Meat," was read:—

Liebig's extract of meat may be substituted for, or used in conjunction with, beef tea in the following manner:—A quantity of the extract, containing the soluble constituents of 2lbs. of fresh meat, when dissolved in three pints of boiling water, makes good strong beef tea. Salt has to be added to taste. Flavouring ingredients and

spices may also be added with advantage. Beef tea is ordinarily made thus: A quantity of meat (mostly from the leg of the ox), say 2lbs., is chopped or cut small, and put on with five pints of cold water. It is then heated to boiling, and the scum which rises taken off. It is further boiled down* to three pints, and the liquid strained from the meat residues. The latter are now in such a condition that human beings refuse to eat them, and cats and dogs will eat them only under the compulsion of great hunger, or with the addition of a little salt.

If 2lbs. of beef, or their soluble constituents in the shape of Liebig's extract, are used to make three pints of broth, a beef tea results, which is as strong as ought ever to be used. For some persons and some purposes the three pints may, with advantage, be diluted to four.

Liebig's extract is free from fat and gelatine; the beef tea made in our kitchens contains both. Careful cookery prescribes the removal of the fat from beef tea or gravy soup, but the gelatine is not by any means excluded. On the contrary, much of our gravy soup, or light thin soup so-called, consists of "stock," which is mainly a decoction of all kinds of bones resulting from culinary operations.

This gelatine adds a trifle to the nutritive value of the gravy, but injures its taste; it hangs gluey or sticky about the lips. It is the less objectionable the larger the proportion of actual extract of meat, or decoction of meat (real beef tea) that is mixed with it. It is by no means a necessary ingredient of good beef tea or gravy soup.

There is one clear gravy soup, containing gelatine only, known in the art of cooking, namely, the "soupe maigre," from the drum-sticks or tarsal bones of fowls, so pathetically described by Beauvilliers, in "L'Art du Cuisinier;" but this is actually only a curiosity.

If Liebig's extract contained fat it would not keep, but become rancid; if it contained gelatine, it would be impossible to estimate its value as compared to the best beef tea; for the best dry gelatine being only half the price of extract of beef, its admixture would depreciate the extract; and as the amount of gelatine in the extract would, or might be, variable, and could in no case be determined, the value of the extract would be uncertain, and it could not be bought or sold as it can now, by the standard of the meat-weight, which a given quantity of it represents.

In my opinion Liebig's extract will be more generally useful in the following cases:—

1. As an aid to cookery in houses of the middle classes, managed with intelligence.

2. As an aid to cookery in hotels and eating-houses of all descriptions.

3. As a ready means for producing quickly a nutritive, easily digestible, and tasty soup for great numbers of persons, under circumstances where elaborate cooking is impossible. Thus, for soldiers on the march, in camp, or even in barracks, for mariners on board ship, for patients in hospitals, for the recipients of charity in soup-kitchens, for the poor in workhouses and asylums, for prisoners in jails, and for children in schools, orphanages, refuges, &c., good soup can be prepared quickly by dissolving the necessary quantity of the extract in boiling water, and pouring this over bread, or toasted bread.

Any ordinary soup, made with water and with ingredients such as peas, rice, potatoes, &c., and even with lumps of meat, may be greatly improved by the addition of a suitable quantity of the extract. One teaspoonful of the extract dissolved in a quart of the ready-made soup, would make it of the same beef-tea strength as is ordinarily used in good household soups of the middle classes.

But the extract will probably remain inaccessible to the poorer classes in general, for the following reasons:—

(a.) Because the extract cannot be retailed con-

veniently in quantities adapted to daily wants, and because its viscid nature makes its sub-division and distribution, without material loss, very difficult.

(b.) Because in warm weather it has to be stored in a cool larder or cellar, to prevent it from becoming putrid.

(c.) Because its use presupposes a certain knowledge and intelligence on the part of the person charged with its preparation, without which great waste would be certain to result.

NOTE BY MR. HARRY CHESTER ON THE FOREGOING MEMORANDUM.

The extended use of *Extractum carnis*, as the beefy element of soup, may have an important bearing on the general question of supplying meat for the masses of the people; because the *Extractum* thus used is for the most part brought from South America and Australia, and is substituted for the British beef which would otherwise be consumed in the making of stock.

DEPUTATION TO THE ROYAL AGRICULTURAL SOCIETY.

A deputation from the Council of the Society of Arts, consisting of Mr. Harry Chester, Vice-President, Mr. D. Robertson Blaine, Mr. G. F. Wilson, F.R.S., and the Secretary, met a deputation from the Council of the Royal Agricultural Society, consisting of Mr. Thompson, the President, Mr. Dent, M.P., Mr. C. B. Read, M.P., Mr. S. B. L. Druce, with the Secretary, on Thursday, the 7th inst, in order to seek the co-operation of that Society in promoting the education of the working classes engaged in the cultivation of the soil.

Mr. Chester explained the system of examinations instituted by the Society of Arts, and said that the object the deputation had in view was to ask the Royal Agricultural Society to exert its influence for the improvement of primary education among agricultural labourers, and to induce the higher class of such labourers and mechanics to avail themselves of the advantages offered by these examinations.

After a conversation, Mr. Thompson expressed, on the part of the Council of the Royal Agricultural Society, their willingness to consider what could be done to aid the Society of Arts in this matter, and promised that the subject should receive their most favourable consideration.

Sir Thomas Phillips, Chairman of the Council of the Society of Arts, was prevented from attending by indisposition.

CANTOR LECTURES.

"ON MUSIC AND MUSICAL INSTRUMENTS." By JOHN HULLAH, Esq.

LECTURE II.—MONDAY, MARCH 11th.

MELODY, &c.

Mr. Hullah began his second lecture by referring to a statement he had made in the first—that music and noise, however different practically, were but degrees of the same thing. Something of the same kind is true of melody and harmony, seeing that no close consideration

* This boiling down is not necessary when Papin's digester is used. In that case the exact amount of water is added, and the pot closed.

f the nature and properties of the one is possible without continual reference to the other. No doubt it is convenient to distinguish them, but not to say that pure melody is impossible, seeing (as was shown in the first lecture) that a single sound can only exist for an instant, every melodious progression is good or bad in so far as it conforms to some principle of harmony, and every harmonious progression is good or bad in so far as the individual sounds of which it is composed move with freedom and propriety. A single chord is an example of harmony only, but when we follow it by another chord we introduce melody. He had often been asked, "Does a musician, in composing a song, for example, make the tune first and the bass and other parts afterwards, or how?" The process of musical, like every other kind of composition, is difficult to analyse or describe, but probably, whatever may be the practice with others, educated musicians always simultaneously conceive whatever is to be simultaneously executed; and some plan and finish large sections, and even whole movements, by a single effort. Mr. Hullah alluded to another statement he had made in his first lecture—that the presence of two notes of the natural scale was the characteristic of modern music; and that unless these two notes were found in occasional juxtaposition, no idea of a key or scale, in the modern sense of those words, was possible. Also, that music deficient in the juxtaposition of these two notes, whatever might be its other merits, was, in comparison with the music of our own times, of necessity indistinct in outline and pale in colour; and that the same thing was true, in some degree, of national melody, whether of ancient peoples, who had cultivated music scientifically, or of modern peoples, who had not. The idea of a scale or a key, is represented sufficiently for practical purposes by the word *tonality*. The music of the old masters differs from ours in many things, but more than all in tonality. But there is music differing from ours, not only in tonality but in system; the word "system" technically expresses the number and relation of the sounds between any given sound and its octave. In the modern European system the extreme number of these is thirteen, but other peoples have made a different division. In stating this, the lecturer did not take into account the savages concerning whose music some travellers have given us such exact information. When one of these tells us that the inhabitants of some island in the Indian Ocean habitually sing the third of a scale a quarter of a tone sharper than Europeans, we may reasonably demand evidence of his right to dogmatise on such a nice point. Musicians, highly gifted and highly practised, occasionally fail in their own intonation, and are mistaken concerning that of others. But, without reference to barbarians, it is certain that systems different from ours have been employed by nations sufficiently cultivated to expound them; their instruments would, in many cases, prove this. Mr. Hullah here compared (by the aid of diagrams) two or three oriental systems with our own. Melody, constructed on some of the former, certainly might give pleasure, after a time, even to us. But harmony, save within the narrowest limits, was, on any system but our own, inconceivable. Further demonstration (accompanied by illustration) of the nature of a scale, and its variety of modes, led to the conclusion that two conditions were essential to a melody, in order that its tonality might be unequivocal. (1.) That it include the fourth and seventh of a scale, and (2) that it end on the key-note, or on a note of the triad of the key-note; i.e., if a melody were in the key of C, it must include B or F, or both, and end in C, E, or G. Even these two last endings were of doubtful legality. Perhaps tonality depends more on ending on the key-note than on anything else; for there are many tunes the tonality of which, but for so ending, would be uncertain. The well-known tune, "Ye banks and braes of Bonnie Doon" (whether English or Scottish it is needless to inquire), is a case in point. The first section of another Scottish tune, "Could hail

in Aberdeen," presents another example. The fine air, "Roy's wife of Aldavalloch," is not only wanting in a fourth and seventh, but ends on a note not decisive of its tonality. It may be the third of a modern scale, or the final of an ancient one. "Hey tuttie tattie" ends on the fifth of the original key; one very obvious mode of harmonization would make it end in the key of the dominant of the original. Another tune, "Shame fa' the gear," ends on the sixth of the key in which it begins—its relative minor; thus, as was common in old tonality, beginning in one mode and ending in another. An instance of the exact converse of this is found in the Irish melody, "Arrah, my dear Eveleen," which began in A minor and ended in its relative major. Another characteristic of Irish, Scottish, and Oriental melody is the frequent introduction of the minor or flattened 7th of the tonic; as of B flat, supposing the tonic to be C. Two instances were given of this, the Scotch tune, "Baloo, loo, Lammy," and the Irish, "The old Lang o' lee." Mr. Hullah then called attention to a popular error, which had probably grown out of this omission of the 4th and 7th—that most national melodies are in a minor key. He had long believed that this was not the case, and had been gratified to find his opinion confirmed by Mr. Carl Engel, of whose "Introduction to the Study of National Music" he spoke in very high terms. Mr. Engel believed that the proportion of major to minor national tunes is at least as high as eight to one. The misconception arose from the frequent occurrence of the minor 3rd in what Mr. Engel called the "pentatonic" scale—that in which the 4th and 7th were wanting. To what causes could the anomalies that have been alluded to be ascribed? Mr. Hullah had expressed elsewhere considerable doubts as to the genuineness of many so-called ancient melodies—transmitted, as many of them had been, through long ages, from voice to voice, and from instrument to instrument, without the conservative influence of musical notation. He gave an instance, in which he was personally concerned, of very considerable alteration made in a song, sung from memory, during only a very few years. But, whether genuine or not, a vast body of melody exists which presents very peculiar, not to say anomalous, features. On the supposition that the melodies were originally vocal, many of these anomalies are unaccountable. There is nothing in the nature of the larynx which would suggest or necessitate imperfect scales; but with instruments the case is altogether different. Vocal music is always supposed to be anterior to instrumental. But is this supposition justifiable by reason or probability? History would seem to point to a different conclusion, seeing that the earliest mention of music is not in connexion with a singer, but with him who was "the father of all such as handled the harp and the organ." Few sounds in nature, perhaps none, are isochronous. No untaught bird maintains the same pitch in singing for more than an instant. Neither the wail of the wind nor the roar of the sea are isochronous. Who will undertake to express thunder in musical notation? But the simplest reed or cane is easily convertible into a musical instrument—if it be not one already, and almost any stretched string will give a musical sound. If instrumental be anterior to vocal music, many imperfect melodies may be of prodigious antiquity. But whichever of the two be the senior, both are pre-historic,—as are, possibly, the germs, at least, of many national melodies.

FOURTEENTH ORDINARY MEETING.

Wednesday, March 13th, 1867; GEORGE FERGUSSON WILSON, Esq., F.R.S., Member of Council, in the chair.

The following candidates were proposed for election as members of the Society:—

De Vere, Albert, 86, St. James's-street, S.W.
 Ellis, E. S., The Newark, Leicester.
 Elwes, V. Cary, Billing-hall, Northampton.
 Kirkbank, John, 10, Gray's-inn-square, W.C.
 Knowles, John, 42, Moorgate-street, E.C.
 Pearce, Joseph Salter, 18, Barnsbury-street, N.
 Potter, Edward, Marine-house, Tynemouth.
 White, Henry Hopley, Q.C., the Firs, Rectory-grove,
 Clapham, S.

The following candidates were balloted for,
 and duly elected members of the Society :—

Alsop, John Alfred, 22, Brunswick-square, W.C.
 De Salis, Colonel Rudolphe, C.B., 123, Pall-mall, S.W.
 Freeland, Humphry William, Chichester.
 James, W. H., 78, High-street, Camden-town, N.W.
 Kime, William Thomas, Louth, Lincolnshire.
 Leslie, Thomas Edward Cliffe, Union Club, S.W., and
 22, Old-square, Lincoln's-inn, W.C.
 Marsh, William Robert, The Rice Mills, Bromley, E.
 Morgan, Fortescue J., Stamford.

The Paper read was—

THE TINNEVELLY PEARL FISHERY.

By CLEMENTS R. MARKHAM, Esq.

In bringing before a meeting of the Society of Arts the subject of the pearl fishery on the southern coast of India, I desire in the first place to disclaim all pretence to scientific knowledge, and to make it clearly understood that any special knowledge I may possess is merely derived from a careful attention to the subject during the last few years, and from a personal inspection of the Tinnevelly fishery grounds in the early part of 1866.

From time immemorial the pearl fishery in the narrow sea which separates Ceylon from India, has been famous in all the marts of the Old World, and has rivalled the renowned fishery of Bahrein, in the Persian Gulf. Opinions have always varied respecting the value of the pearls from these fisheries. Tavernier, the travelling jeweller, whose account of Persia is so well known to readers of old voyages and travels, said, in 1651, that the pearls from the sea that washes the walls of Manaar, in Ceylon, are, for their roundness and water, the fairest that are found, but rarely weighing more than three or four carats. Master Ralph Fitch, a London merchant, who made a voyage to the Indies in 1583, asserts, on the other hand, that though the pearls of Cape Comorin are very plentiful, they have not the right orient lustre that those of Bahrein have. Whatever the truth may be, touching the pearls of these rival fisheries, there can be no doubt that a vast concourse of merchants has been attracted to the Gulf of Manaar from the most ancient times, which is sufficient evidence of the value of the pearls. In later times the banks off Rio de la Hacha, Margarita, Cubagua, and Panama, in South America, have yielded large harvests of pearls; but the banks in the Persian Gulf and the Gulf of Manaar have been and still are the main sources of supply in the Old World.

The Ceylon fisheries have retained their reputation; but it is to the banks on the opposite side of the gulf of Manaar, off the shores of the collectorate of Tinnevelly, that I desire now to draw attention.

In the golden age of the Tamil people of southern India, the Tinnevelly pearl fishery paid tribute to the Pandyan kings of Madura. Its head-quarters, we are told by Ptolemy, were then at Koru, the modern Coilpatam. Marco Polo, in the end of the 13th century, mentions the land of Maabar, where many beautiful and great pearls are found off the coast. The merchants and divers, he says, congregated at Betalar in April and May; and he relates how the divers performed incantations to preserve them from the attacks of great fish in the depths of the sea. The shark charmer is still paid by the Ceylon Government for his attendance at the

fisheries. In those days the sovereign received a tenth, and the divers a twentieth of the proceeds of the fishery. The great abundance of pearls from the Tinnevelly fishery, and from that of the Ceylon coast, excited the wonder of all the bold wanderers from Europe who completed the perilous voyage to India in early times. Friar Jordanus, a quaint old missionary bishop, who was in India about 1330, says that 8,000 boats were then engaged in this fishery and in that of Ceylon, and that the quantity of pearls was astounding and almost incredible. Friar Odoric, who travelled at about the same time, says that in this land are found as great store of good pearls as in any part of the world. Old Ludovico di Varthema, the garrulous wanderer from Bologna, mentions having seen the pearls fished for in the sea near the city of Choyl, in 1500, or thereabouts; and his Portuguese contemporary, Duarte Barbosa, gives a more detailed account of the fishery. He says that "close to this island of Coulam, in the sea, there is a sand bank covered with 10 or 15 fathoms of water, in which a very great quantity of fine seed pearls are found, small and great, and a few pearls; and the Moors and Gentiles go there from a city which is called Saal, belonging to the King of Coulam, to fish for this seed pearl, twice a year by custom, and they find them in some small oysters, smoother than those of our parts."

The head-quarters of the fishery were then, and indeed from the days of Ptolemy to the 17th century continued to be, at Choyl, or Coyl, or Saal as Barbosa has it, literally "the temple." This place is, according to Dr. Vincent, the Kora of Ptolemy, the Kholi of the author of the Periplus, the Koil or Choyl of the travellers of the middle ages, and the Ramana Koil ("Temple of Rama") of the natives. This would place it on the sacred promontory of Ramnad, or the island of Rameswarum. But it is more probable that the true locality which was the head-quarters of the Indian pearl fishery from time immemorial, is to be found at or near the modern salt station of Coilnapatam, on the coast between Tuticorin and Trichendoor.

Tuticorin, the present head-quarters of the fishery, has supplanted the ancient Coil for the last two centuries; and since the middle of the seventeenth century the agents of the powers that have successively directed the fishery, whether Portuguese, Dutch, or English, have uniformly taken their station at this little port. It is about 90 miles N.E. of Cape Comorin, on the Tinnevelly coast. The Naiks of Madura, the Telugu sovereigns whose family had succeeded the ancient Pandyan dynasty, were at the height of their power in the middle of the seventeenth century, and were lords of the Tinnevelly coast. These Naiks were the builders of all the magnificent edifices which now beautify the city of Madura, and their dues from the fishery were probably used as offerings to Minakahi, the fish-eyed goddess of the vast Madura pagoda, who now possesses amongst her jewellery a numerous collection of pearl ornaments. The Naik sovereigns had the proceeds of one day during the fishery, and when the Portuguese were powerful along the coast the Jesuits enjoyed those of another, whilst the owners of boats were entitled to one haul every fishing day. In those times there were 400 or 500 vessels at the annual fishery, and at the subsequent fair held at Tuticorin there was an assembly of from 50,000 to 60,000 persons. Captain Hamilton, who was travelling in the East from 1686 to 1723, described Tuticorin, when the Dutch were masters of the port, as well as of Ceylon. He says that a Dutch colony at Tuticorin superintended a pearl fishery a little to the northward of that port, which yielded to the Dutch East India Company a yearly tribute of £20,000.

The Dutch appear to have fished too recklessly and too often. On the Ceylon side, off Arrippe, they fished from 1667 to 1768, with short intervals, their last fishery having been in 1768, after which year the banks had complete rest until the first English fishery in 1794. On

on Tinnevely side the Dutch fisheries were also incessant, almost annual. After the English occupation of Tuticorin there was a fishery in 1622, which yielded a profit of £13,000 to the Indian revenue. Another in 1830 yielded £19,000. Between 1830 and 1856 there were 13 examinations of the banks, and on each occasion it was found that there was not a sufficient number of grown oysters to yield a profitable fishery, and none was attempted. Meanwhile the state of affairs on the Ceylon side was far more satisfactory. From 1796, the date of the first English fishery at Arripo, to 1809, the yield was £517,842; from 1828 to 1837 it was £227,131; and from 1856 to 1860, £117,163. In 1859-60, of the two principal Ceylon banks, the Modragan yielded £2,000,000 and the Cheval-paar 60,000,000 shells.

The unsatisfactory condition of the Tinnevely banks, from the year 1830 to 1856, has been attributed to various causes. Captain Robertson, the late master-attendant at Tuticorin, thought that the widening of the Paumben channel, which has caused a strong current to flow over the banks, prevented the molluscs from adhering to the rocks; and that the boats employed in fishing for large shells, called *chanks*, killed the pearl oysters by anchoring on the banks; while the native divers attributed the state of the banks to the pernicious influence of two other bivalves, called *soorum* and *kullikoz*.

In 1856, however, an examination made by Captain Robertson proved very satisfactory, and four banks off Tuticorin, called the Cruxian-paar, the Nagara-paar, the Oodoroo-vee-paar, and the Klatee-paar were found to be well covered with young oysters, which would be old enough to be fished in 1860-61. The Madras Government, therefore, determined that every precaution should be taken, in order that the banks might receive no damage in the interval. Vessels were provided to protect the banks from poachers, and the chank fishery was ordered to be put a stop to at the termination of the contract. Captain Robertson was, unfortunately, lost in an unseaworthy *patamar*, which had been obtained from the Bombay Government in March, 1859. He was succeeded as master-attendant and superintendent of the Tinnevely pearl banks by Captain Phipps, to whose zeal and intelligence the fishery owes its present hopeful condition, and under whose auspices the fishery of March, 1860, the first that had been attempted since 1830, was opened.

The fishery of 1860 commenced on March 7th, and the sale of the Government share of oysters was conducted by public auction, which began at 15 rupees, and gradually rose to 40 rupees per 1,000. As many as 15,874,600 shells were sold, realising upwards of £20,000 as the net result to Government, exclusive of all expenses and of the shares allowed to the divers. In 1861 the results of the fishery were equally satisfactory, but in 1862 the banks were found to be in a most unpromising state, and no fishery was attempted. Out of 72 banks that were examined, only fourteen had oysters on them, and 57 were blank. The subsequent examinations were still more unsatisfactory, until the beginning of the present year, when Captain Phipps reports having found an immense quantity of pearl oyster fry on four of the banks off Tuticorin, namely, the Cruxian-paar, the Nagara-paar, the Klatee-paar, and the Atawae Arupam-paar.

I will now proceed to give some account of the pearl oyster, and of the establishment forming the Tinnevely Fishery.

It is, perhaps, unnecessary to observe that the pearl oyster is not in reality an oyster at all, being more allied to a mussel. It has, like the latter animal, a *byssus*, or cable, by which it secures itself to the rocks, one of the most important points in its organization. When the animal desires to attach itself to a rock, its foot is protruded, and, after seeking out a suitable spot with the tip for some minutes, is again retracted into the shell. A strong fibre, of the form of the groove in the foot, is left attached to the base of the foot at one end and to

the rock at the other. The process is again and again repeated until a strong cable is formed; and the animal is able to throw out a fresh *byssus* whenever it is broken by removal or other accident. The formation of pearls is a point which has long puzzled scientific men, and the subject received very minute attention from Dr. Kelaart in the course of his investigations at Trincomalee. Pliny and Dioscorides believed that pearls were the productions of dew; but that observant old Elizabethan navigator, Sir Richard Hawkins, shrewdly remarked that "this must be some old philosopher's conceit, for it cannot be made probable how the dew should come into the oyster." Modern research has suggested various causes for the intrusion of the nucleus round which the pearl is formed. Dr. Kelaart has suggested that the ova which escape through the distended coat of an overgrown *ovarium* may become imbedded in the interstices of the mantle and form nuclei of pearls; or that the siliceous internal skeletons of the diatomaceæ which form the food of the pearl oysters may serve a similar purpose. But Mr. Gwyn Jeffreys, in his report to the Secretary of State for India, informs us that "pearls are produced in consequence of the irritating tenacity of minute parasitic crustacea that adhere closely to the outside of the mantle of the pearl oyster. In order to get rid of these troublesome intruders the pearl oyster smothered them with a coating of nacreous matter, of the same description as that which lines the inside of its shell; and the gradual superposition of layer upon layer in concentric order results in the formation of the much-prized ornament. Its shape depends upon that of the nucleus. The parasites are of different kinds, some being spherical, others oval, and occasionally lying so close together as to make the pearl double or irregular. That the nucleus of the pearl ever consists of a grain of sand, or of the food of the pearl oyster, seems to me physically improbable. Any loose adventitious matter, such as sand, would be immediately removed by the continued action of the mantle, which is thickly covered with *cilia*. The food cannot find its way to the outer coat of the mantle through the wall of the stomach, as Dr. Kelaart imagined; and even if it got there it would not remain. Pearls are invariably found between the mantle and the inside of the shell."

The pearl oyster banks, which are very numerous, lie off Tuticorin and Trichendoor, and are about six to eight miles from the shore, and from five-and-half to eight-and-half fathoms from the surface. Each bank has a name, by which it is known to the divers. They consist of masses of rocky ground, rising in patches from the sandy bottom, and are probably exposed to ocean currents, which, by washing sand into the interstices of the rocks, often destroy the young oysters over a considerable area. The dead fish soon contaminate their neighbours; and, in addition to this danger, the pearl oysters share the banks with other inhabitants, some of which are undoubtedly pernicious to their well-being. Amongst bivalves, the most common are a large *pinna* (called by the natives *arkoe*), a *modiola* (called by the natives *soorum*), which is a sort of mussel with a swelled face, and an *avicula* or swallow-tail (called *kullikoz*). The divers believe that the two latter are very injurious to the pearl oysters, but Mr. Gwyn Jeffreys does not think that this can be the case. "They may," he says, "by congregating in too large numbers, choke the pearl oysters, like weeds in a garden; but the food of all is the same, namely microscopic animalculæ, and there is plenty of it." The pearl oysters, however, have a really formidable enemy in the great chanks, a sort of whelks (*Turbinella rapa*), which are used as horns in the worship of idols, and cut into segments of circles as bracelets for women's wrists. The chanks, when they get a chance, drill small holes, by means of their proboscis or tongue, in the shell of the pearl oyster, and then feed upon the mollusc; but it is asserted at Tuticorin that, while the pearl oysters live on the rocks, the chanks are generally found on the sand. The chank

fishery at Tuticorin was, at the time of my visit, leased to a Mr. Barter, at the rate of £25 a canoe for the season, of which he employed nine. They started at early dawn from the chank godown, about half a mile north of the town, and sailed out in a line, for a distance of some three or four miles, returning at dusk. The trade in chanks is almost entirely with Calcutta, and their price, formerly twelve rupees, was then only six rupees per hundred. There are also large starfish on the banks, of a white colour, picked out and fringed with bright crimson. Mr. Gwyn Jeffreys recommends the destruction of chanks and starfish whenever they are found on the banks, just as vermin are destroyed in a game preserve.

The pearl fishery has been conducted, from time immemorial, by a caste called Parawas, who are met with along the Tinnevely coast, from Cape Comorin to the Paumben channel. They were all converted and baptised wholesale by St. Francis Xavier, and are now Roman Catholics, the ancient church at Tuticorin being the freehold of the caste. The headman of the caste, an hereditary office, is called the Jati Talaven; he has a good house, built in the Dutch times, with portraits of former Jati Talavens; but the present man spent £1,000 on his daughter's marriage, and is now heavily in debt. The Parawas drink very hard, but there is no thieving or other crime among them, and they are capital boatmen as well as divers. The divers age very fast, and all look old and withered men, from exposure and drink. They cross themselves before plunging into the water; and I was told that the longest time that any of them has been known to keep under is one minute and eight seconds. They get a rupee a day in ordinary times.

When a fishery is announced to take place, one thousand pearl oysters are got up, opened, and put into a canoe, where the whole product of pearls is collected. This is considered as a sample of the fishery, and the pearls are submitted to the inspection of the most experienced pearl merchants, who class them on a fixed principle. The classification is as follows:—

1. *Anie*, pearls of perfect sphericity and lustre.
2. *Anathorie*, failing in one of the above two points.
3. *Masengoe*, failing slightly in both points.
4. *Kalippo*, failing still more.
5. *Korowet*, or double pearls.
6. *Peesal*, or misshapen pearls.
7. *Oodwoos*, beauty.
8. *Mandangoe*, bent or folded.
9. *Kural*, very small and misshapen.
10. *Thool*, seed pearls.

The number of each class found in the sample is then published, on the authority of the experts, and this establishes the price of the shells at the outset, but the price fluctuates afterwards, according to the frequency of the prizes that are subsequently drawn. Tavernier mentions the same practice in 1651. He says that "in the eastern seas, before they fish, they try whether it will turn to any account, by sending seven or eight boats to bring 1,000 oysters each, which they open, and if the oysters per thousand yield five *fancos*, or above, then they know the fishing will turn to account." In 1861, the price began at 70 to 80 rupees per 1,000 shells, and afterwards sank to 40, 20, and 17 rupees. The fishery was held on the beach, about two miles north of the town of Tuticorin, at a place called the "Silawatooree," a Tamil word, meaning a fish-market. The shells were sold on large chunamed platforms, called *kottos*, and hundreds of huts, with a few bungalows, surrounded the market, and formed a busy and very exciting scene.

Since 1861 there has been no fishery, and the attention of Captain Phippe has been unremittingly turned to the improvement of this interesting source of revenue. He is allowed a small establishment to guard and examine the banks. Two small schooners, the *Emily* and the *Edith*, were sent to Tuticorin in 1860, but the latter is now stationed at Paumben. The *Emily* was built at

Cochin, of teak, with copper fastenings, 54 feet long, 35 tons burden. There is also a little teak-built canoe of 19 tons, called the *Pearl*. In 1865, a steamer called the *Godavery*, built for the navigation of that river, was sent to Tuticorin. She is of iron, of 80 tons burden, with an engine of 25 horse-power, and draws 3 feet; she is flat-bottomed, and quite unfitted for sea service. The establishment costs 300 rupees a month for the months during which the season lasts, and the vessels are daily out on the banks; and for the rest of the year the skippers of the *Emily* and *Pearl* get 12 and 15 rupees a month respectively. This very trifling outlay has hitherto sufficed for the examination and guarding of the pearl banks.

A Government pearl fishery is a most legitimate source of revenue, and forms an exception to other monopolies. Pearls are simply articles of luxury, in the strict meaning of the word. The seas in which they grow cannot well become private property, and, if a profit can be derived from their sale, it is certainly a source of revenue which can give just cause of complaint to no man, while it benefits the community at large. In India, too, the Government are possessed of advantages which enable them to get the work of superintending and managing done with far greater economy and efficiency than could be secured by any private individual or company. So high an authority as Mr. McCulloch has taken an opposite view, and says that the Government monopoly ought to be abolished, because the expense of guarding and managing the banks exceeds the sum for which the fishery is let, and because anyone who likes should be allowed to fish on paying a moderate license duty. The edition of the "Commercial Dictionary" from which I quote was published in 1864, and during the two following years the Tinnevely Pearl Fishery yielded a large net revenue to the state. This is a sufficient answer to Mr. McCulloch's argument. It is true that there has been disappointment; but the way to secure regular annual returns is to adopt a carefully considered system of conservancy, and not to throw the fishery open to the depredations of all comers.

The precarious and uncertain condition of the Tinnevely Pearl Fishery may be attributed, as it seems to me, to the reckless and improvident fishing of former times, and to the absence of a scientifically organised system. It is a very old story. A valuable product is discovered to be a source of considerable wealth, and forthwith a system of reckless destruction for the sake of immediate gain is inaugurated. Then the supply begins to fail, a panic ensues, and, when science and forethought are called in, it is discovered that ordinary prudence and a judicious system of conservancy would have ensured a regular and unfailing yield from the first. Such has been the history of the chinchona bark in South America, of the teak timber in the Malabar forests, and, such I suspect, is the secret of the unsatisfactory condition of the Tinnevely Pearl Fishery since the Dutch times.

Indeed the same general principles will probably be found to be applicable to forest conservancy, and to the management of a pearl fishery. As a nursery of young trees forms an essential feature of most forest systems, so, as it seemed to Captain Phippe, a nursery of young pearl oysters would serve to replenish the pearl banks; and this idea was confirmed by a study of the method adopted with regard to edible oysters on the English and French coasts. The chief external difference between the pearl and edible oysters, is that the former secures itself to rocks and stones by means of a *byssus*, while the latter merely lies flat on the ground on its convex side, but there does not seem to be any ground for doubting that the pearl oyster might also thrive on artificial banks. In the Colne oyster fishery, the brood (i.e., oysters two years old) is dredged up out at sea, and placed on *layings* within the River Colne. These layings are generally dry at low water, and they are paved with stones, old shells, and any other hard substances, to the depth of a few inches, so as to form a bed for the oysters, which would

otherwise be choked in the soft mud. This material is called *culch*. The culch must be kept perfectly clean and clear of mud, and every mussel-shell must be weeded out, because they have a tendency, from their shape, to cause accumulations of mud. The oysters remain on the sayings for two years, when they are fit for eating; and during this time there are constant examinations, in order that all dead fish and mussels may be removed, and the culch kept clean. In places where the sayings are never laid bare by the tide, this is done by means of dredge. All live oysters and culch are carefully thrown back, while dead fish, mud, star fish, mussels, and whelks are removed.

It seemed to Captain Phipps (a view in which I entirely concurred) that some such system might advantageously be tried at the pearl fishery; especially as Dr. Kelaert had previously ascertained that the pearl oyster is more tenacious of life than any other bivalve with which he was acquainted, and that they can live in places so shallow as to be exposed, for two or three hours daily, to the sun, and other atmospheric influences.

The following measure has, therefore, been sanctioned, for the formation of a pearl oyster nursery:—

The harbour of Tuticorin is formed by the Devil's Point, to the southward, and a reef, with two small islands, called Punnayudee-teevo and Paundian-teevo, to the east. Lat. $8^{\circ} 47' 17''$ N.; long. $71^{\circ} 14' 19''$ E. To seaward, in strong breezes, the surf breaks along this reef, in 12 ft. of water, but between the islands and the mainland there is good shelter. Large vessels, coming for cotton, coffee, and senna, are obliged to anchor outside the Paundian-teevo, at the north end of which there is a lighthouse; but there is snug anchorage for small craft inside, and close to the town of Tuticorin. Between the Paundian-teevo and the mainland there is a bank, with a depth of from 3 to 7 feet, entirely free from surf, currents, and influxes of fresh water. Captain Phipps has selected this bank for the site of a pearl oyster nursery. A parallelogram has been enclosed with walls 450 ft. long, 8 ft. wide at the bottom, decreasing to 5 ft., and 10 ft. high. These walls are composed of blocks of coral, and strengthened by rows of palmyra piles. There is to be a small bungalow at the western corner. At the centre of the eastern wall an opening 8 ft. wide is left, to be closed by wooden gates. The intention is to have the floor lined with blocks of coral or of rock, as culch; and to stock the laying thus formed with pearl oysters about two years old. The nursery was commenced in November, 1864, and completed in the end of 1866. When the act of spawning takes place, the fry will be caught on culch, prepared for the purpose, and allowed to grow until the young oysters are large enough to be removed to the deep-sea banks. The same plan will be followed in each succeeding year. The removal is necessary, because it would be impossible to enclose an artificial space large enough to hold as many grown shells as are required for a remunerative fishery, and because it is believed that the quality of the pearl depends on the depth and clearness of the sea in which it is found. This, however, requires proof. A single pearl oyster, 5 or 6 years old, often contains no less than 12,000,000 eggs, and in the fishery of 1861 the total number of shells taken only amounted to 15,847,500, so that the number of young molluscs annually obtained from the nursery will, no doubt, be abundantly sufficient to stock one or more of the banks. In the fishery of 1861, the two best banks, namely, the Patta-marikan-paar, and the Nagara-pear, yielded 5,882,000 and 4,798,000 shells respectively, producing 128,666 and 52,771 rupees. It is during the period of early growth that the pearl oysters are most exposed to danger on their native banks; and, at all events, the nursery system will ensure to them a much briefer exposure to such dangers, while it will provide against such complete denudation of the banks as has been so frequent of late years.

Of course the nursery is an experiment, but it appears to be one which is well worth a trial. Two objections have been raised to its success by men who are personally acquainted with the locality. It has been urged—first, that the sun will kill the molluscs in only five feet of water; and, secondly, that instead of one opening there ought to be several, allowing a free flow of water. With regard to the first objection, Mr. Gwyn Jeffreys says that “the pearl oyster thrives best in clear water, the depth being immaterial.” “I am not aware,” he adds, “how far the influence of the sun's rays can penetrate the water in tropical seas; but I do not believe it would prejudicially affect molluscan life.” To the second objection it may be replied that the ebb and flow of the tide through the single opening, which is about 16 inches, will cause a sufficient movement of water, and that if not, other openings can easily be made.

After the nursery was completed Captain Phipps was met by the very serious difficulty of a total absence of pearl oysters for stocking it. The Tuticorin and Trichendoor banks were found to be quite blank. On the 25th of November, 1865, I spent the day on board the *Emily* over the Cruxian-pear, which is about four miles outside the Paundian-teevo light-house, and used to be considered one of the best banks. Divers went down several times, and there was a dredge overboard, but not a single live pearl oyster was brought up. There were several dead ones, together with pinnae, aviculae, purple sea-urchins, starfish, chanks, and pectens. The same result attended the examination of all the other Tinnevely banks, and an equally unpromising state of things existed on the Ceylon side during the season of 1865-66.

Under these circumstances I strongly recommended that a supply of pearl oysters for stocking the Tuticorin nursery should be obtained from the Persian Gulf. Both Professor Huxley and M. de Broca (who has conveyed live molluscs from the United States to France in large quantities) consider that it would be quite feasible to convey pearl oysters from Bahrein to Tuticorin; and Mr. Gwyn Jeffreys has recommended that a supply of brood pearl oysters be procured from the Persian Gulf, and says that they could easily be transported alive in wells, such as are constructed for bringing cod-fish and lobsters to Billingsgate.

Soon after I made this recommendation, Colonel Pelly, the political resident in the Persian Gulf, sent me his interesting report, dated December 16th, 1865, on the Bahrein pearl fishery, which enables me to give a few particulars respecting it; premising that it has been previously described by several old writers, and in 1863 by Colonel Wilson. Colonel Pelly's is, however, the most recent account.

He says that the pearl banks along the Arabian coast of the Persian Gulf are the property of the Arabs in common, but no foreigner is allowed to fish them. The richest are those of the island of Bahrein, which are found at all depths, from a little below high-water mark to eighteen fathoms. It is believed by the Arabs that the lustre of the pearl depends on the depth of the water, and the best oyster beds are said to be level, and formed of fine whitish sand overlaying the coral, in clear water. The fisheries have taken place annually from the most remote times, without any sign of diminution in the supply; and about 1,500 boats are employed in them, which belong to Bahrein alone. The profit is about £400,000 a year, and the bulk of the pearl harvest is sent to the Bombay market, the rest to Bagdad. Colonel Pelly concludes his report by suggesting that a few hundred pearl oysters from Bahrein might be sent to the Gulf of Mamar, as an experiment.

While my proposal, that the Tuticorin nursery should be stocked by pearl oysters from the Persian Gulf, was under consideration, it became known that Mr. Holdsworth, the naturalist employed by the Ceylon Government, had found 36,000 pearl oysters on a bank near Mundi-teevo, on the Ceylon coast, and permission was given to take up 10,000 for the Tuticorin nursery.

Afterwards some more were found near Paumben, and on the banks off the Madura coast; and last January Captain Phipps made the welcome discovery already mentioned, that four of the banks off Tuticorin were well stocked with young oysters. The sea-weed that was brought up was found to be covered with fry, and Mr. Gwyn Jeffreys, to whom I forwarded a small parcel of it for inspection, has pronounced it to be fry of the pearl oyster.

Thus, the difficulty of stocking the banks and the nursery is, for the present, at an end, but it will probably be five or six years before the oysters will be sufficiently matured to allow of a profitable fishery. Meanwhile, the experiment will proceed in the nursery, and six large aquaria, with the necessary apparatus, microscope, and instruments, have been sent to Tuticorin, to furnish Captain Phipps with the means of watching the habits of the pearl oyster. A suitable room is now in process of erection for their reception.

Such are the measures that have been adopted with reference to securing an unfailing stock of pearl oysters for the fishery. The next point of importance is to attend to those rules of conservancy which are, as it seems to me, applicable alike to forests which clothe the mountains and to pearl banks which line the bottom of the sea. In the cork woods of Catalonia, for instance, the cork is taken from the same tree every eighth year. The plantations are, therefore, divided into eight sections, and one of these forms the harvest for each successive year. The same system will yield a highly remunerative return to the Government and other owners of chinchona plantations in India. In like manner, if the pearl oyster reaches maturity in six years, the banks might be divided into six sections, one of which would form an annual source of supply for a profitable fishery, and the stock might be kept up, with the assistance of the nursery. It would appear, from recent experience, that there are about two fisheries, yielding a net profit to Government of £40,000 every ten years, equivalent to a return of £4,000 a year, but coming in at very uncertain intervals. There seems to be no reason why this state of things should not be so far improved, by a system of scientific and carefully matured conservancy, as that the pearl fishery should be made to yield a regular annual return of £10,000 a year, at least, to the Indian revenue, so long as a demand for pearls continues to exist.

A very essential part of the duties of the superintendent will be to watch the banks every year, and carefully to examine their condition as often as possible. Mr. Gwyn Jeffreys has recommended that the banks should be dredged frequently, for the purpose of destroying the chanks and other noxious shell-fish, with their spawn, as well as the star-fish, the pearl oysters being carefully replaced; that systematic dredging should be carried on in the deeper water, for purposes of exploration, and to discover new pearl banks; that a steamer should be used for dredging and guarding the banks; and that a supply of pearl oysters should be obtained from Bahrein.

The provision of a steamer is a recommendation of the greatest importance. As diving operations must necessarily be conducted during calm weather, sailing vessels are of very little use for examining the banks, and the river steamer *Godavery*, already mentioned, is equally unsuited for such service. She is flat-bottomed, burns a ton of coal per hour, goes about four knots an hour, rolls tremendously, and, when there is any sea on, is positively dangerous. One superintendent has already been lost by providing him with an unseaworthy craft, and such a calamity must not be allowed to recur. The proper kind of vessel for service on the pearl banks would be an iron screw steamer of 40 tons burden, sixty feet long, by 15 broad, drawing five feet, and fitted with a screw propeller and engine of 10-horse power. Such a vessel could be provided for the comparatively insignificant cost of £1,700; and it is to be hoped that, before long, the Government will decide upon furnishing

the superintendent with this very essential means of performing his duties on the pearl banks.

It will have been seen, by a consideration of the points which I have endeavoured to explain, that the possibility of so far improving the Tinnevely Pearl Fishery as to ensure an annual supply of oysters, yielding a net profit to the State, depends upon the success that may attend our measures, first, for furnishing adequate supplies for stocking the banks; secondly, for husbanding that stock; and, thirdly, for the conservancy of the banks.

The measure which I have advocated for securing supplies for stocking the banks is that originated by Captain Phipps, namely, the rearing of pearl oysters in an artificial nursery. It is true that the success of this experiment is considered doubtful by Mr. Gwyn Jeffreys, Professor Huxley, and other very high authorities, but, at the same time, there do not appear to be stronger reasons to expect disappointment than are attendant on every new experiment, and this one is certainly worth a trial. Under any circumstances, when the natural supply fails, the banks can be stocked from other localities. The husbanding of the stock will be attained by a careful attention to the rule that the pearl oysters are never to be fished until they have reached full maturity; and if they are of different ages on different banks, an annual fishery will be insured. Lastly, the measures of conservancy embrace a frequent examination of the banks, and the destruction or weeding out of everything that is detrimental to the growth and well-being of the pearl oysters.

In conclusion, I cannot refrain from an expression of my conviction that if success is possible, it will be attained by the present superintendent, Captain Phipps, whose zeal, energy, and fertility of resource have already been so beneficially exerted. The Tinnevely Pearl Fishery could not, I am well assured, be in better hands.

It is with much diffidence that I have ventured to address this Society on so interesting and important a subject, because my want of accurate scientific knowledge renders it impossible that I should have done it justice. I trust, therefore, that it has been fully understood that I only profess to have given the results of a personal inspection of the fishery ground, and of some previous and subsequent study of the subject.

DISCUSSION.

The CHAIRMAN, in inviting discussion on the paper, mentioned that there was one enemy of the pearl oyster which Mr. Markham had not alluded to, and which he was informed was considered in Ceylon to be a very formidable one—that was a large fish of the skate species, which was supposed to eat the oysters, shell and all.

Mr. WRIGHT inquired whether he had rightly understood Mr. Markham to say that, as far as Ceylon oysters were concerned, the pearls were found in the body of the oyster, and not in the shell.

Mr. MARKHAM replied—Always between the mantle and the shell.

Mr. WRIGHT remarked that in the shells from the Persian Gulf, and those from the Arru Islands, south of New Guinea, the pearls were found occasionally in the nacreous part of the oyster, or what was commercially known as mother-of-pearl. The natives, when the oysters were collected, generally drilled a hole in the mother-of-pearl or shell, or broke it up to get out any real pearls there might be in it, but occasionally they missed one, and he recollected, about ten years ago, a workman in Birmingham found, in one of the shells he was employed upon, a very large and perfectly-formed pearl, which he disposed of for £40, and it was afterwards resold for £200. Small pearls were frequently found in this way, some perfect, and others only of partial formation. In the instance he referred to, the pearl was perfect in form, and of the shape and size of a small damson.

Mr. FRANK BUCKLAND had listened with great interest to Mr. Markham's able paper on a subject on which, comparatively, little was known in this country. During the last seven years there had been a similar failure of the oyster crops in England to that which had been mentioned with regard to the pearl oyster banks; indeed, there had hardly been any crop at all in England. He thought they ought to consider very seriously the cause of this failure. The reasons given by Mr. Markham were, that the oysters were either destroyed by the chanks or the star-fish, but he (Mr. Buckland) was of opinion that the failure of the crop of pearl oysters, as also of the English oyster fisheries, was due to larger causes than those mentioned by Mr. Markham. They had been told that as many as 12 millions of eggs were found in a single pearl oyster. The English oyster had as many as 800,000 eggs. Yet where were all the young oysters? There must be some greater causes of destruction of the young brood than those mentioned in the paper. He believed it was because there had been no "fall of spat," and that remark applied, particularly during the last three or four years, to the whole of the oyster fisheries of the British Isles, extending to Ireland. He was delighted to hear that a project for the artificial cultivation of the pearl oyster had been taken up. The success of that undertaking would depend very much upon supplying to the young oysters the conditions which they required. The young oyster brood required, in the first place, to be kept in a state of tranquillity, and to be protected from currents of water, as a very slight current was sufficient to waft them to a distance from the parent bed. That, he thought, to some extent accounted for the new beds discovered by Captain Phipps. He (Mr. Buckland), therefore, highly approved of the proposed plan of impounding the young brood in the situations in which they were found. The heat of the sun, where the beds were in shallow water, would, he thought, occasion no difficulty; for, if the pearl oyster was anything like the English species, the young brood were best developed under a considerable amount of solar heat; it was only the older fish which required to be shifted into deeper water. The tanks on which the oysters for breeding were deposited should, in his opinion, be protected as much as possible from the action of the tide. If that were not done there was danger of the young spat being carried away. He entirely approved of the system of dredging referred to in the paper. He would ask what was the depth of water over the bank. [Mr. MARKHAM replied about seven fathoms.] That, Mr. Buckland said, might be a practicable depth for efficient operations with the dredge. He also agreed with the system of "culling" the crop, and distributing the oysters, according to their growth. That was the plan adopted in England; and thus each year in turn produced its matured crop of oysters. The dredging would do no harm to the young pearl oysters, because they would soon form a new byssus. He did not very well see how dredging could be carried on by means of a steamer, especially one with a screw, as there would be a difficulty in using more than one dredge at a time, whereas four or more were sometimes put out together. As all the dredges would drift in the same direction, there was danger of the drag ropes getting foul of the screw. He very much preferred dredging with a sailing vessel. He quite agreed with the admirable remarks in the paper with respect to the reckless destruction of the oysters. It almost made him weep to hear of it. He called it murder to take little oysters not bigger than half-a-crown, which in a few years would have come to maturity, and have fetched a large price in the market. Reverting to the many destructive influences to which the young brood of pearl oysters were exposed, it occurred to him that a sandstorm might cover them over and destroy them; a sudden irruption of cold water from the bottom, or an influx of snow water from the land, might have the same effect; and, moreover, in tropical climates an oyster bank might be destroyed by submarine volcanic action. He did not think so much of the

ravages of the skates mentioned by the chairman, as they must have a very voracious appetite to eat up a bank of oysters seven miles in extent. When one bank was exhausted, the managers should look out for another, and by means of the dredge follow up the young broods, who, in some degree, resembled swarms of bees, who did not usually travel very far before they alighted in search of fresh quarters. The dredging was also beneficial in preventing the oysters from being killed by the superposed weight of too large an accumulation at one spot, and in killing the star-fish, or "five fingers," the greatest vermin on an oyster farm.

Mr. GWYN JEFFREYS (responding to the invitation of the chairman) said, with reference to what Mr. Buckland had stated on the subject of dredging from steamers, he doubted whether that gentleman had had much experience in that operation; he (Mr. Jeffreys) had dredged for six weeks together with a steamer in the Shetland Isles, and constantly kept two dredges at work at a depth of from 80 to 100 fathoms. He found that method of dredging was by far the best for scientific exploration, and it would be equally so for such valuable products as pearls and oysters. In his opinion there was nothing like a steamer for dredging. They could regulate the speed as they pleased, and the results were far more satisfactory than with sailing vessels. The steamer he used had paddles, but it made very little difference whether a paddle or screw was used. The observations of the first speaker as to the formation of pearls in the nacreous or inner layer of the pearl oyster were quite correct; imperfect pearls were often found in that position. He did not think they would be of much commercial value, because they were not spherical, but contrivances were adopted for cutting off the irregularities, so as to improve the appearance of the pearl. The observation of the chairman, with respect to the destruction of the pearl oysters by a fish of the skate species, was important, and he was himself inclined to rank this fish with the tribe of star-fish and whelks and other natural enemies of the pearl oyster; but, by dredging and carefully watching the banks, he thought this skate might be destroyed, as well as, to a great extent, all the other vermin, so to speak, which had been mentioned. He had brought, for the inspection of the meeting, some specimens of young pearl oysters, some of which were brought over by Sir Emerson Tennant, and others were sent to Mr. Markham by Captain Phipps. He had also brought a section of a pearl, which he had prepared in order to ascertain what the real cause of the pearl formation was; and he found, by microscopic observation, there was an animal organism, and he should say—though it was difficult to make out these minute things, in consequence of some of the parts having been destroyed or lost—that the formation was of the nature described in his report, quoted by Mr. Markham, and which he thought would receive the general assent of zoologists. As a visitor this evening, he would express his thanks to Mr. Markham for the interesting account, historical, practical, and scientific, which he had given of this subject. He was quite satisfied, from what he knew of Mr. Markham, it was his modesty only which prompted his disclaimer of scientific knowledge, which he (Mr. Jeffreys) so well knew he possessed.

Mr. TRACY mentioned that, being engaged in the working of mother-of-pearl shells some years ago, he obtained two or three real pearls from a shell, in which they were imbedded just below the inner surface. These had been found in a China shell, which yielded mother-of-pearl of purer quality than the Bombay shells, the latter being generally dark about the edges. The pearls which he found in the way he mentioned were perfectly formed, about the size of tare seed, and of an oval shape.

Mr. WRIGHT said, although he was not able to give any information on the subject of pearls proper, he would, with the permission of the meeting, offer one or

two remarks upon a product which was of greater commercial importance in this country, viz., the mother-of-pearl. The greatly increased use of that article in various branches of manufacture—more particularly of an ornamental character—had doubled the price of it during the last twelve months. The quantity of pearl shells imported into this country varied in value from £40,000 to £100,000 per annum. The most valuable shells for manufacturing purposes were found at the Arru Islands, which he had before referred to. According to the growth they varied in size, from as large as the palm of the hand to the crown of a hat. Last year there were fished 130 tons of shells from that locality. The value had now risen from about £7 per cwt. to £13 or £15 per cwt., in consequence of the great demand for mother-of-pearl articles in France and America, as well as in England. The fishery next in importance was that on the Sooloo Islands; the shells being distinguished by the yellow colour of the border and back, which rendered them unfit for ornamental manufactures, but they were principally used in Sheffield for knife handles and other purposes of cutlery. The shells which ranked next in commercial value were those known as the Bombay shells, which in reality came from the Persian Gulf fisheries; large quantities of them had lately been transported to this country by the overland route. The next important fishery was that in the Red Sea. The shells were sent to Alexandria; and since the railway had been opened from Trieste to Vienna nearly the whole of the produce of that fishery had gone to the latter city, affording employment to a large number of Viennese artisans, who manufactured for the American market, and had displaced the manufacturers of this country in that market to the extent of 50 per cent. Some years ago, between 4,000 and 5,000 persons in Birmingham found employment in the mother-of-pearl manufacture, but not half that number were now engaged in it. Since the great rise in the price of the shells had taken place, a very large proportion of the Red Sea produce was sent direct to London, and at the present moment there was probably a larger stock of Red Sea pearl shells in London and Liverpool than had been known for the last eight or ten years. The two other fisheries of note were that in the Gulf of Panama, called the Pearl Islands, and that in the Gulf of Mexico, from both of which large quantities of shells were annually obtained. It would seem that the temptation of the present high prices had led to these fisheries being worked to a greater extent than a due regard to future supplies warranted. The Americans had gone so far as to announce the formation of a mother-of-pearl fishery company, the operations of which were to be carried on by means of submerged vessels, but whether or not these would answer was still to be ascertained. Some years ago there was a pearl fishery in the Low Archipelago. The shells differed from all others in having a deep dark tone, iridescent, but not what was commercially known as black pearl, which was in fashion eight or ten years ago, but had now gone entirely out of demand. The price of these shells thirty years ago was only nominal, and large quantities of them were disposed of in Birmingham by burying them in the earth; but, upon the demand for them arising, many instances occurred in which they were dug up again and used. He hoped that these observations would be of some interest to the meeting, as the mother-of-pearl afforded employment to a large number of persons in this and other countries. He should be glad if Mr. Markham and other gentlemen would turn their attention to the obtaining of larger supplies for this country of the valuable shells from New Guinea and the Sooloo Archipelago. He stated, in conclusion, that the mother-of-pearl obtained from Ceylon was entirely useless for commercial purposes in this country.

Mr. J. H. MACKENZIE would be glad to hear from Mr. Markham whether there was any good reason why the production of the pearl oyster should not be more developed on our own coasts. He had been informed by

a friend that in some of the deeper lakes in Scotland, very profitable trade in pearl oysters had been carried on for several years. He believed that the cultivation of the pearl oyster could, with skill and care, be successfully carried on in our own latitude. The pearl was so beautiful a gem, that although the interest of a few dealers might be affected by a larger supply being obtained, it was desirable it should be placed, if possible, more within the reach of the community generally. He thought the development of the culture of the pearl oyster on our coasts was a subject worthy of the attention of this Society.

The CHAIRMAN, in closing the discussion, said he had seen a good deal at different times of the pearl mussel from which the Scotch pearl was obtained. He had seen instances of what were termed the false pearls: the shells of those mussels, but they were never of great beauty. He had no doubt some gentlemen present had seen or heard of the pearls which were brought by Mr. Fortune, from China, where they got a large pearl mussel, and put into it several little brass images of Bhudda, which became coated over with the pearly excretion, although they did not partake of the character of true pearls. Mr. Mackenzie spoke of the Scotch pearls as an industry worth being cultivated, with a view to increasing the production of that gem in Great Britain. When fishing in the Highlands last year, he (Mr. Wilson) met with an individual who styled himself the Prince of Wales's pearl fisher, and who wore a silver badge in his bonnet, which he had presented to him by the Prince. Whether his claims might be to that distinction, he was not himself to be a well-informed and intelligent man, on the subject of pearl fishery displayed an amount of knowledge which would have been interesting in a lecture-room. He (the Chairman) had brought with him a pair of Scotch pearl shells, which were given to him by the person to whom he alluded, and which had, externally, every indication of containing valuable pearls; indeed, that pearl fisher informed him that he would have given £2 for the shells when first taken out of the water on the chance of the pearls they might contain. Some of the Scotch pearls he thought possessed greater beauty than many people supposed; and he would be for the inspection of the meeting some fine specimens which he had himself procured in that country. With regard to what had fallen from Mr. Mackenzie, he was bound to say his friend the Highland pearl fisher took an opposite view as to the probable remunerative character of the Scotch pearl fishery. He stated that he had exercised his vocation in his boat for many years, but, unfortunately for him, the people on the banks of the rivers, who constructed a cheap description of boat for themselves, over-dredged the rivers, and rendered his occupation a very unremunerative one. The chairman concluded by moving a vote of thanks to Mr. Markham for his very interesting and able paper.

The vote of thanks was passed, and briefly acknowledged by Mr. Markham.

Proceedings of Institutions.

BANK OF ENGLAND LIBRARY AND LITERARY ASSOCIATION.—In the seventeenth annual report, just issued by the Committee, though rejoicing in its continued prosperity, regret that they cannot offer to the members such unmixed congratulations as they have been enabled to on former occasions, but have the painful duty of referring to the loss the Association has sustained in the death of its President, William Miller, Esq., who, though the term of his presidency was but short, yet gave proofs of his interest in the association, and his desire to promote its welfare. The association has also lost another well-known member, the death of Mrs. Thwaites, who

have liberal donations to the funds. The number of members now on the roll, including 9 life members, is 107, being an increase of 12 over the number reported last year; and the library now contains 11,206 vols.; 356 of which have been added during the year. Several donations have been received, especially one of £25 from Mrs. Thwaytes, and a large number of books from various donors. The Committee, in compliance with the very generally expressed wishes of the members, have abolished library fines except those levied on engaged books. The financial statement shows that the receipts have been £305 12s. 3d., and that there is a balance in hand of £17 15s.

WESTMINSTER WORKING MEN'S CLUB.—The sixth annual meeting of this club took place on Thursday, the 13th December last. Sir R. W. Carden presided, and was supported by Judge Payne, the Revs. Canon Conway, J. Wright, and Samuel Minton; W. Delpratt, Esq., Mr. G. Blaby, &c., with the working men's committee, and the members of the singing class. There were also present Lady Filmer, Mrs. Cooper, Miss Adeline Cooper, and other friends. It appeared by the report that in December, 1860, the first club-room was opened in Duck-lane; it was enlarged by the addition of another room in December, 1861, was again enlarged and remodelled in November, 1863, and the premises being required for the Westminster Improvements, the club and its various societies were transferred to the present locality in April last, this being the sixth anniversary meeting. The Penny Bank is open three times a week, secretary, Mr. Thomas Griffith—deposits during the year, £89 2s. 4d.; withdrawn, £99 12s.; balance in hands of treasurer, £10 2s. The Labour Loan Society, enrolled according to Act of Parliament, meets every Wednesday evening; secretary, Mr. Andrew Glynn. There are 39 members; capital, £155 19s. 11½.; amount of loans, £224; balance in hand, £20 11s. 9½d. The Temperance Committee meet every Monday evening; secretary, Mr. John Byland. The public temperance meetings are held on alternate Tuesdays; a sick fund is connected with the society, formed by a subscription of 1d. per week, which entitles a member of thirteen weeks' standing to 5s. a week for a month, in case of sickness. 368 pledges have been taken during the year; income of the society, £8 16s. 6d.; expenditure, £10 12s. 10d.; balance in hand, £5 16s. 1d. The barrow club is conducted on Monday evenings. A barrow, price 55s., is furnished to a member who pays 1s. a week for the hire of it, and at the end of fifty-five weeks it becomes his own property. Five barrows were supplied last year, and twenty-five barrows since the formation of the society. The co-operative society committee also meet on Monday evenings; secretary, Mr. James Peachey. The members first assembled to form the society on the 1st of December, 1865, when sixty-seven shares were taken up. The shop was opened on the 6th of July, and business was commenced with a capital of £30; the takings of the store during the first three months were £322; total income to the present time, £563; expenditure, £556; present capital, £40. Number of shareholders, thirty-two; number of paid up shares at 5s. each, 160; donations, £13 19s. 2d. The Bible-class continues to be conducted by W. Delpratt, Esq., but the educational classes could not be continued for want of some voluntary aid. Through the kindness of W. H. Allan, Esq., a chess club has been formed; it numbers thirty-two members, and is in a very efficient state. A donation of £2 had been received from the Earl of Shaftesbury, for books for the library, also gifts of books and three pictures from J. B. Harrison, Esq. Thirteen lectures, illustrated with diagrams, models, and experiments had been delivered and much appreciated, and three special meetings held. Admirable addresses were then delivered by the chairman, by the Rev. Canon Conway, the Rev. J. Wright, and Joseph Payne, Esq. A feature of the evening was the unveiling of a portrait of the Earl of

Shaftesbury, painted expressly for the club, to which it is presented by J. B. Harrison, Esq., as a mark of his interest in the progress of the club, and a tribute of esteem for the noble Earl. A vote of thanks to the chairman was passed, and the meeting concluded with "God Save the Queen" and the Benediction.

PARIS UNIVERSAL EXHIBITION.

The Imperial commission has apparently decided on a complete change in the exterior decoration of the building. The colouring in panels in dark reds and bronzes seems to have been given up, and a uniform metallic painting adopted; it has rather too much the appearance of being black-leaded, but perhaps the effect is better than that of any of the previous attempts at decoration. The iron walls are being enlivened by the erection of large flag-staffs on the great pillars, the staff being several feet down on the face of the pillar, which is capped with a voluted ornament in zinc gilt; on the shaft of the staff is a decorated shield. The experiments with these staves afford another valuable lesson in decoration. The first staff put up was of plain wood, or painted the colour of yellow pine, varnished, and at the lower end was a gilt knob; this, being placed against the face of one of the square wrought pillars, had an admirable effect, while the floating pennant drew off the observer as it were from the iron ship-like sides of the building. The flag-staves have since been painted in bright colours, spirally, and instead of harmonising with or decorating the building, they stand out like barbers' poles, and challenge criticism. The word staff hardly represents the thing itself, which is more like a small mast; the knob is certainly nearly two feet in diameter, and the ornamental cap placed on the top of the pillar is at least four feet wide, but then, it must be remembered that the pillars are about a hundred feet high.

Great activity is displayed in the unloading of goods, and the great machine gallery no longer presents the empty appearance that it did a month ago. The three steam cranes are doing excellent service in this section, and it is to be regretted that permission was not given by the French authorities for the working of Messrs. Aveling and Porter's traction engine, which was brought over for the purpose of conveying the heavy machinery into the building. There are now in place Messrs. R. Stephenson and Co.'s inside-cylinder passenger engine, a small tank engine by Hughes and Co., a goods engine by Kitson and Co., of Leeds, and a passenger engine by the Lilleshall Company, of Shifnal, Shropshire.

The heavy machine tools by De Bergue and Co.; Whitworth; Sharp, Stewart and Co., who, among other things, exhibit a lathe for turning railway wheels; Shepherd, Hill and Co.; and Worssam's wood-working machines are now in place.

Shand and Mason's steam fire engines, "La Seine," and "La Rhône," have also arrived.

Some fine specimens of iron are being unpacked in Class 40, sent in by the Earl of Dudley and the Bowling Iron Company.

The English agricultural implements are being placed in a well-lighted shed, situated near the railway station at the north-western corner of the park. Amongst the machinery that has been unpacked and in place, may be noticed a "Royal Patent Harvester," by Hornsby and Sons, Grantham; Fowler's steam plough; some ploughs by Ransomes and Sims, of Ipswich; and Richmond and Chandler's chaff-cutters. In the park the English are making great progress with their buildings. The trussed wooden girders to carry the roof of the boiler-house are now being raised into place, on the top of 56 ornamental terra-cotta columns. The boilers have been tested by the French engineers. They consist of three forty-horse Galloway boilers; a thirty-horse water-tube boiler, by Howard, of Bedford; a water-tube boiler by Hayward

and Tyler, of London; an arrangement for heating the feed water is also in place.

The English cottage is also well advanced, and promises to be an important addition to the park. Experiments in heating, lighting, and ventilation will constantly be carried on in it during the exhibition. Upwards of 140 manufacturers have contributed towards its construction with material and fittings. The roof is covered with a great variety of different kinds of slate and tiles.

The shed for the exhibition of the government war material is about 80 feet in length by 65 feet in breadth, and the guns, &c., are now being unloaded by some non-commissioned officers of the Royal Artillery, assisted by a working party of French artillerymen. A coil, weighing 18 tons 12 cwt. 3 qrs. has already been placed. A gun, weighing 24 tons, is also being unloaded.

Another shed, covering about the same area, for the exhibition of war material by private exhibitors, amongst whom Whitworth and Armstrong, and John Brown, who exhibit some heavy armour plates that have just arrived, occupy the principal space, is not quite finished, but judging from the activity displayed by every one connected with the exhibition, it will no doubt be ready to receive the guns, &c., in three or four days.

A timber lighthouse, upwards of 150 feet in height, is now well advanced, and will soon form a prominent feature in the ground, rivalling in height that constructed by the French lighthouse board, of wrought and plate iron. The French lighthouse is 177 feet in height, and weighs upwards of 380 tons; it was designed by M. Rigolet.

The barrack hut is now ready to receive the various fittings and furniture.

In the French department a great deal of machinery is being fixed. A 4-ton steam crane, by J. Chretien, of Paris, is working most satisfactorily. A cylinder, of great length of stroke, is placed in the jib of the crane, and the chain is connected directly with the piston-rod, and passes over pulleys, arranged in such a manner that the weight is lifted to a height of four times the stroke. Four locomotive engines are already in place, the first that arrived was one constructed by the well-known firm of Parent, Schaken, Cail and Co., of Fidas-Lille, for the heavy goods traffic on the Northern of France Railway, and as to quality of workmanship, it will bear comparison with any of our English makers. It is an eight-wheeled, coupled, outside-cylinder goods engine; and weighs, when in working order, upwards of 44 tons. The next are a ten-wheeled, coupled, outside-cylinder goods engine, for the Orleans Railway, weighing, when loaded, about 55 tons; a six-wheeled engine, by the same company, and a four-wheeled, coupled, outside cylinder engine, that has been constructed by the firm De Grafenstaden. The engines for the Mont Cenis Railway, constructing by M. Gonin, of Paris, together with the railway carriages, being made by Messrs. Chevalier, Cheilus and Co., of Paris, are also to be exhibited, but have not yet arrived. Several railway carriages and waggons, for the Eastern Railway, with a brake-van, fitted with Achard's electric brake, are also in place. The horizontal engines, by Duvergier, of Lyons; Boyer, of Lille, &c., are ready for working. Mazeline, of Havre, is fixing a good many machine tools.

The "Steyerdorf," the ten-wheeled articulated tank engine, designed by M. Haswell for the Austrian State Railway, that was exhibited in 1862 in London, has arrived, and will be exhibited here. M. Hartmann, of Chemnitz, is fixing several lathes, drilling, and slotting machines of excellent workmanship.

Cail, Halot, and Co., of Brussels, are exhibiting a good deal of machinery in the Belgian section, amongst which may be mentioned some sugar mill apparatus. Two cast-steel guns, from Krupp, of Essen, are being placed in the Prussian section of the great machinery gallery.

Some of the Saxon printing machines may be mentioned for their excellent workmanship and finish.

Three railway carriages, exhibited by the Berlin Joint Stock Company, are also in place.

The Imperial commission has decided on the exclusion of the public from the present moment, and has thus given satisfaction to an almost universal demand. Now that the time is so short, it is quite clear that no one but those engaged in, or otherwise connected with, the preparations should be admitted.

The yacht and pleasure boat department has grown to so much importance, that the nautical class has been sub-divided, and we have now Class 66 bis, or 66a, as we should say, *navigation de plaisance*. The sheds for the yachts, boats, and models, by the side of the Seine, are ready, and will soon contain an interesting collection. Twenty-seven officers and sailors, from Brest, will be attached to the station, the detachment to consist of a master gunner, a second sailing master, two quarter-masters, four carpenters, and ten picked able seamen. An officer and six sailors will attend to the management of the salt-water aquarium, and two non-commissioned officers and a sailor to the exhibition of a life-boat. The Empress, Prince Napoleon, and Mustapha Pacha are contributors to the collection of yachts and pleasure boats.

The weather has undergone another change which is not favourable to the progress of works out of doors, but the various operations in the park are being pushed on with all possible dispatch.

The horticultural garden may almost be said to be complete, that is to say, nearly all the iron and other heavy work is done; the glazing of the conservatories will not occupy very long, and the filling of the houses with plants is only the work of a few days, as those that are to be shown are carefully kept elsewhere till wanted. The same may also be said of the shrubberies and flower-beds, and M. Barillet Deschamps, the gardener of the city of Paris, and his five hundred men will soon make the parterres brilliant with flowers and foliage. They are now busy planting the shrubs.

The French fine art admission juries have done their work, and the result is the admission of 550 oil-paintings, 102 statues, 40 busts in marble, or terra-cotta, 83 frames of engraving, 23 of lithography, and 28 of architecture.

The jury for the admission of objects of art for the retrospective gallery is now appointed; it is divided into five sections. The first, which includes works of the ante-historic period, consists of M. Larbet, of the Saint Germain Museum Commission, president, and MM. Bertrand, Colomb, Desnoyers, Vachere de Reffy, the Marquis de Vibraye, and G. de Mortillet, secretary. The second section, that of sculpture, consists of M. Longperier, president, MM. Barbet de Jouy, Barthélemy, Chabouillet, E. Fould, B. de Monville, C. Oppermann, De Saucy, and Henri de Longperier, secretary. The third section, painting, Baron Alphonse de Rothschild, president, MM. Ph. Burty, L. Delisle, A. Firmin Didot, E. Galichon, F. Reiset, Baron James Ed. Rothschild, and J. de Laborde, secretary. Section the fourth, goldsmiths and jewellers' work, arms, locks, metal utensils, &c., the Marquis Leon de Laborde, president, Count d'Armaillé, E. de Beaumont, Prince Czartoryski, E. Dutuit, Jules Labarte, Col. Pinguilly l'Haridon, Baron Jerome Pichon, Baron Gustave de Rothschild, Count de Saint Seine, and F. Seillière, secretary. The fifth section, furniture, glass, china, &c., consists of M. du Sommerard (of Cluny museum), president, G. Aigoin, A. de Basilewski, Ch. Davillier, Leopold Double, Dreyfus, E. Guichard, the Marquis of Hertford, L. Leroux, Maillet-Duboullay, Count de Nohovis, d'Yvon, and Albert Jacquemart, secretary. M. Alfred Darcel, of the museum of the Louvre, secretary of the special commission for this branch of the exhibition, acts as general secretary for the jury.

The accounts from foreign countries promise well for the prospects of the exhibition. The Commercial Council of Brussels has just voted a sum of 5,000 francs in aid of a fund for enabling Belgian workmen to visit the exhibition.

The *Gard* steamer has brought 60 cases containing a *tion* of the objects to be exhibited by the Pacha of *ypt*; on its last voyage the *Gard* brought 43 immense cases of wood-work for the Egyptian buildings in *park*.

The new Taikoun of Japan has decided, it is said, to *ad* his brother to represent him at the exhibition.

AGRA EXHIBITION.

The Exhibition of Works of Art and Industry made *a* committee representing the North-West Provinces *India*, has recently taken place at Agra with great *access* (a notice of the objects likely to be exhibited, *as* lately given in the *Journal*, see p. 181). It seems to *have* excited much interest among both the natives and *the* British. It remained open from Monday, the 4th *February*, to the Saturday following. Prizes were *awarded* by jurors, but the list was not dispatched by *the* last Indian mail. It was opened, in state, by *the* Lieutenant-Governor, Mr. Drummond.

The following was the speech of the President of the *Central* Committee, Mr. Thornhill:—

“HONORABLE SIR.—The Central Committee, to whom *you* entrusted the arrangements for carrying into effect *your* desire that a general exhibition of the Agricultural and Industrial products of the North-West Provinces *should* be held at this place, beg now to lay before you a *brief* report of their proceedings, by which they trust *that* your wishes will have been realized.

“2. Your Committee's first attention was directed to the adoption of measures for the adequate representation of the existing condition and resources of every district under your Honour's government, but they felt that the advantage afforded to producers, by the present opportunity, of comparing themselves with their fellow-countrymen in these provinces, would be greatly enhanced if the production of this part of the country could be shown in juxtaposition with those not only of other Provinces of Hindoostan and of the more distant Indian possessions of the British Government, but also with those of other Eastern countries, whose arts and manufactures have, until recently, been little known, and which will probably be seen for the first time by the majority of those who will visit this building.

“3. That your Committee have been able to bring together so varied, so interesting, and so valuable a collection of the products of the industry of China, of Japan, of Java, of Burmah, and of Singapore, and exhibit them with those of our Indian empire, is due entirely to the hearty and ready co-operation of all those whose aid they solicited.

“4. It is not less a duty than a gratification to acknowledge thus publicly their obligations, and the Committee desire to take this opportunity of bringing prominently to your Honour's notice the names of those to whom this Exhibition is more especially indebted for whatever measure of success it may be held to have achieved.

“5. For the spacious building in which we now are assembled, and in which so much that is rare and costly is displayed, we are indebted to the fertility of resource and ingenuity of one of our members, Mr. George Sibley, the chief engineer of the East Indian Railway, and to the courtesy and liberality of the Board of Agency of the Company, who placed the materials of which the structure is composed temporarily at our disposal.

“6. The exterior architectural embellishments, and the internal decorations, are the work of Lieutenant Cole, of the Royal Engineers, to whose artistic skill and cultivated taste the building is indebted for whatever ornamental character it possesses.

“7. It would be superfluous to praise that which must commend itself to all, but the Committee cannot refrain from congratulating themselves upon having been enabled to entrust this important department to an officer so eminently qualified to introduce into this coun-

try a decorative art, which as yet is so little known amongst us.

“8. Skilful ornamentation has not, however, been confined to the buildings alone—the garden, which is now blooming in what was a barren and apparently hopeless waste but a few weeks ago, and the ornamental band stand, attest the skill and energy of Colonel Rowlatt, to whom the sole credit of this metamorphosis, as well as of the orchestral arrangements, is due.

“9. To the Government of Bombay, the Committee are indebted for their large and valuable collection of the interesting objects exhibited from that Presidency, which was presented to this Exhibition at a cost of 10,000 rupees.

“10. This liberal gift was enhanced by the nomination of Dr. Birdwood to superintend the selection; and the care and judgment shown by that officer, not less than the great personal interest he has evinced, has rendered the Bombay contribution one of the most attractive in the building.

“11. The Committee are under a great obligation to the Honourable Mr. Justice Phear, who, during a visit to China, selected and brought to Calcutta the many specimens of the arts and manufactures of that country which are now exhibited.

“12. Mr. Temple, the Chief Commissioner of the Central Provinces, has not only forwarded a rich and most interesting collection of the products of his territory, but has also permitted his own series of water-colour drawings, illustrative of the physical aspect of the country, to be exhibited in the building appropriated to the Fine Arts.

“13. The Committee have also to acknowledge Mr. Temple's courtesy in deputing Lieutenant Trevor, the secretary of the recent Jubbulpore Exhibition, to convey his contributions to Agra.

“14. The Committee are under very great obligations to Mr. Dowleas.

“15. This gentleman has not only obtained for them many contributions from Ceylon, Japan, and Singapore, and rendered every assistance in receiving and transmitting consignments intended for the Exhibition, but he has also afforded the Committee the benefit of his large and varied experience.

“16. His suggestions and advice have, on many points, been invaluable, and the Committee have to regret that his important duties, in connexion with the Paris Exhibition, prevent Mr. Dowleas from being here to-day to witness the close of the labours which he has done so much to lighten.

“17. The Committee has also to tender their acknowledgment of the assistance they have received from

“The Hon. Colonel Macpherson, of Singapore.

“Mr. W. Morgan, to whom they are indebted for the Javanese collection.

“Captain J. O. Mayne, of the Royal Engineers, by whom the specimens were selected from.

“Captain Prothers, Secretary to the Government of the Straits' Settlement.

“Dr. Hunter, of Madras; Colonel Barrow, Lucknow; Major Paske, Goozerat; Major Lewin, Umritsur; Captains Beynon and Walter, of the Rajpootana Agency.

“18. The services of residents of these provinces and of the Local Committees will be duly acknowledged in the detailed report which the Central Committee will hereafter submit.

“19. The Committee would, however, except Rajah Sir Dinker Rao, whose liberal expenditure from his own resources, and great personal efforts to contribute to the class of the exhibitors, deserve special notice.

“20. But whatever assistance has been rendered in enabling the Committee to bring together such large contributions from every quarter, would have failed to enable them to carry out the chief end and aim of the Exhibition had it not been for the ceaseless labours of

the curators, by whom all the arrangements have been made for the suitable reception, classification, and exhibition of all the many objects which are here displayed.

"21. Without such arrangement and classification, the Exhibition might have afforded some amusement, but would have failed to accomplish its higher object of instruction and improvement.

"22. Those who see only the results which have been attained may find it difficult to realise the great, and latterly the almost incessant, exertions which were necessary to accomplish all that has been done.

"23. How great and incessant these labours have been, is best attested by the facts that, for the past few days, they have been continued night and day.

"24. The Central Committee desire therefore to bring the services of the Curators, Colonel Rowlatt, Dr. Playfair, Mr. James Simson, Dr. Moir, Lieutenant Cole, and Mr. Webb and Mr. Adam, most emphatically to your Honour's notice, and would direct special attention to the production of the printed catalogue almost simultaneous with the opening of the Exhibition, as a proof of the excellent system and organization which has characterised their proceedings.

"25. Lastly, the Committee commend to your Honour's notice the Secretaries, Messrs. Pollock and Plowden.

"26. Upon Mr. Pollock, as the Local Executive Officer, the main burden and responsibility of this undertaking has fallen; and the Committee feel that they do not exaggerate the value of his services when they attribute to him the chief merit of whatever success has been achieved.

"27. Mr. Pollock, however, on his own part, and on that of the Curators, desires to acknowledge the great indefatigable exertions of Mr. Robinson, who has been their Executive Officer from the commencement, and to whose energy and unremitting labour they attribute in a great measure the rapid progress which has been effected.

"28. I have now, on behalf of the Central Committee, to request that your Honour will announce that this Exhibition is opened to the public."

The Lieutenant-Governor replied in the following terms:—

"Mr. President and Gentlemen of the Committee.—It is with no ordinary feelings of pleasure and satisfaction that I receive the Address you have now presented to me.

"I heartily thank you, Sir, and all those associated with you, for the very able manner in which you have so far carried out the wishes of the Government.

"I shall avail myself of a future opportunity to express my sense of the obligation under which the gentlemen whose names you have just read have laid the government of these provinces. It will suffice to say now, that I cannot too highly commend the public-spirited exertions of those to whom we are indebted for a display of taste, energy, and skill, such as Northern India has rarely, if ever, seen equalled, even in the most brilliant periods of the past.

"Agra, indeed, in the present season, may be said to have resuscitated her ancient glories. The pomp and pageant of the Great Durbar are still fresh in the memory of many of us, but we have here a more interesting, if not so imposing a demonstration, for here, instead of the pomp of courts and the impressive display of military power, we have the most effective evidence of the benefits of civilisation, and of the triumphs of industry, of science, and of art, placed side by side with the raw material from which those wonders are produced, and to which courts owe their magnificence, and for which armies are maintained.

"And here I may say a few words as to what are the objects of these exhibitions:—

"They are intended to be mere ephemeral shows, to amuse and gratify the eye. Broadly, I may say, they

are meant to stir up the community, and to teach it: there may be something in heaven and earth beyond the narrow limits of their present philosophy.

"Their usefulness is freely admitted in England as in Europe; and Mr. Laing, when administering the finances of this country, laid much stress upon the importance of forming Agricultural Associations in the country also, as a valuable aid to social progress. For concurring in that opinion, it has ever been an object with me to promote them, though I wished, as far as possible, rather to foster independent action, irrespective of the government, persuaded as I am that it is only when taken up by the people themselves that such things can prove really and permanently useful.

"In the fulfilment of this wish, however, I have been disappointed, and eventually I determined upon the present exhibition as promising to afford a useful stimulus and guide to those local efforts, which have already been made in several directions, notably in Rohilcond, under the judicious guidance of my friend Mr. Inglis, with very fair measure of success, and to which we must chiefly look for practical improvement of the country. Another special object which I have more immediately in view in selecting Agra as the seat of this exhibition was that of interesting the chiefs of Central India, Rajpootana, and Bundelcond, in connection with the chiefs and gentry of our own territories in the general progress of improvement and the development of the resources of their own states, and I am very grateful for the ready response which our invitations have received from many influential quarters.

"Last, but not least, among the objects of the exhibition is that of promoting cordiality of feeling and friendly association with one another of all the numerous classes—European and Native, whom I hoped to attract and whom I am delighted to see so well represented around me this day.

"I trust these objects will be borne in mind by whom I address to-day, and that they will endeavour, by courtesy and consideration, and free intercommunication, to assist and assure the success of this undertaking, upon which so much care and thought and labour have been expended, so that it may prove, however humble, yet no ineffective effort towards the improvement of the people and the promotion of good-will, and of the amenities of life among all classes. I now declare this Exhibition open."

THE BUDGET OF THE CITY OF PARIS.

The annual financial statement of the Prefect of the Seine is certainly a wonderful document. This year it occupies about thirty columns of the official *Moniteur*, and its totals exceed the revenues of many small states; but it must not be forgotten that the population of the department, which includes, besides Paris, the arrondissements of St. Denis and Sceaux, now exceeds two millions of souls; besides, the document deals with the accounts of three years, from 1865 to 1867, both inclusive, the first of which is not yet finally closed, and the last recently opened.

The following is the estimate for the year 1867, as given in the document in question, omitting centimes:—

Receipts.	Francs.
Ordinary	143,131,124
Extraordinary	12,394,488
Supplementary	25,000,000
Special	61,128,000
Total	241,653,612
Expenses.	Francs.
Ordinary	96,825,791
Extraordinary	59,199,821
Supplementary	25,000,000
Special	61,128,000
Total	241,653,612

dividing this amount by the number of the population, 150,916, we obtain 112 fr. 30 c., or nearly £4 10s. per head.

The estimate for 1868 should also be published at this time, but the Prefect says that it has been delayed by circumstances, and adds:—"In your next session you will be called upon to decide on a financial situation of complete equilibrium, and you will no longer have to accept a budget, of which, in spite of all endeavours, a balance could only be established at the expense of the future."

The increase in the number of apartments is said to be in exact proportion with that of the population, the former amounting, during the last five years, to 55,127, and the latter to 132,139. Since 1852 the demolitions are given as 19,030, and the constructions as 80,055.

The following are principal items of expenditure as estimated for 1867:—

	Francs.
Annual charge on the municipal debt	18,658,696
Administration of the Prefecture of the Seine	63,709,481
Prefecture of Police	13,957,614

The above charge on the debt is upwards of two millions more than in 1866, and more than three millions in excess of that of 1865.

The sum set down for the administration of the Seine includes the following items:—

	Francs.
Public roads and paths	17,100,409
Of which the maintenance alone absorbs	8,352,500
Lighting	4,298,709
Cleansing	3,733,500
Waterworks and sewers	3,152,560
Promenades and plantations	3,247,995

The number of lights are to be increased by 1,000, making in all 31,400, of which 1,400 are oil lamps.

Amongst the items of extraordinary expenses for the coming year are:—

	Francs.
Public Charity	1,016,000
Architecture and Fine Arts	836,667
Bridges and Roads	5,165,000
Continuance of the improvement of the City	25,000,000
Improvement of Public Ways	12,000,000

The special expenditure amounts, in addition, to 61,028,000 francs, and includes, amongst other undertakings, the completion of about twenty-three miles of new roads, ordered in 1858, and of which nearly twenty miles are now open; the formation of conduits for the conveyance of 80,000 tons more water into the canal of the Oureq, and to supply the deficiency of the canals of Saint Denis and Saint Martin in summer; the bringing of the waters of the valley of the Vauve to the new reservoir at Montsouris, eight mètres above the level of the sea, for the supply of the whole of the ancient portions of the city; the completion of two new artesian wells now under hand; the finishing of two large new churches, and the repairs of three others; the commencement of two more ecclesiastical edifices, and the alteration of several others in consequence of improvements made in their vicinity; the completion of one synagogue and the commencement of another; the finishing of the rebuilding of two mairies, the reconstruction of five others, and the enlargement of a sixth; the rebuilding of the Collège Rollin and the Collège Chaptal; the enlargement of the Ecole Turgot, and the construction of a new professional school; the finishing of ten or more other schools, which are either being rebuilt or enlarged, and of the great new barracks in the old city; the construction of a second and the enlargement of a third barrack; the erection of nine large buildings near the fortifications, for lodging the employés,

in addition to five built during the previous year; the completion of the Halles Centrales, or grand central market of Paris, and its connection with the old rotunda, in which the corn market is held; the completion of three local markets and of the great cattle market, and of the new general abattoirs in connection with it at La Villette, and of the new abattoirs for pigs; the completion of the new *parc* of the Buttes Chaumont, and the commencement of two other public gardens, one on the plateau of Montsouris, and the other on the hill of Montmartre; the completion of the immense works of the Trocadero, opposite the Champ de Mars, and of the boulevards, avenues, and plantations forming part of the plan, and of those just commenced for the transformation of the gardens of the Luxembourg, and the avenue of the Observatory. A *résumé* of the public works executed in Paris during the past year was given in the *Journal* of the 21st December last; the above extracts will show the work cut out for execution during the present twelvemonth.

The year 1867 (says the report) was that one which gave rise to the most serious considerations, first, because it formed the central year of the period of five during which the great transformations now under hand were arranged to be effected; and, secondly, because the coming of the Universal Exhibition caused many works to be hurried forward which otherwise might have been left for the years 1868 and 1869, and entailed additional expenses. The Prefect, nevertheless, expresses his conviction that the financial resources of the city will be all-sufficient, and that in 1869 the entire plan will have been carried out, and that the municipality will then be relieved from the burden which now weighs upon it.

When this time arrives (says the report) it will be necessary to consider whether the transformation of Paris shall be proceeded with—whether the surplus means of the municipality shall be applied to the reduction of taxation, or whether it would not be the wiser course to divide the funds at the disposal of the council between the two objects. For the present, or rather for the coming two years, it is the advice of the Prefect that no new works shall be undertaken, and no diminution made in the taxation of the city, in order that the municipal council may be free to take the course which may seem best at the completion of the period in question.

By way of completing the review of the resources and expenditure of the city of Paris, it may be added that the *octroi*, or city dues, amounted last year to more than ninety-two million of francs (£3,687,000), and the population within the walls being rather less than two millions, the average contribution of the whole population was nearly two pounds per head, independently of other local taxes and of those of the State. Of the above sum, all but two millions of francs consisted of *octroi* duty proper, the remainder being made up of a composition paid by the gas company, charges on transit of goods, and sundry small items. The gas company pays two centimes per cubic metre of gas consumed in the city, and the annual consumption exceeds a hundred millions of cubic metres. Of the *octroi* dues, wine, spirits, and other liquids pay nearly two millions sterling; fuel and oil, rather less than half a million; and building and other materials nearly a quarter of a million per annum. The growth of the *octroi* account is extraordinary; in 1855 it amounted to forty-two millions of francs only, so that it has more than doubled in ten years.

Fine Arts.

NEW NATIONAL GALLERY. — The judges are unanimously of opinion that not one of the ten designs can be recommended for adoption. At the same time they

think it is due to the competitors to point to the design for a new Gallery, by Mr. Edward Barry, and that for the adaptation of the old Gallery, by Mr. Murray, as exhibiting the greatest amount of architectural merit. The report then lays down general principles that should be observed in the construction of the National Gallery, which the judges believe compatible with the architectural effect required in a great national building. A correspondence has taken place in consequence of the non-adoption of any one design. The Rt. Hon. W. Cowper, late First Commissioner of Public Works, writes that this course is unfair towards the competitors, and will establish a precedent injurious to the success of future competitions for public buildings. The ten architects have also presented a memorial, in which they state that they agreed to enter the competition on the distinct understanding that one of the competing architects would be selected for employment, and they represent that a contrary course would be a breach of faith and a lasting injury upon every one of the competitors. It appears however that the present Ministry found no written or printed record of the assumed understanding, and Lord John Manners is prepared to abide by the literal letter of the original "Instructions." Furthermore, it would seem that a distinction may be drawn between "competing designs" and "competing architects;" and the terms of the instructions, it is thought, may yet be complied with by giving to some one of the "competing architects" the actual building of the Gallery. All the ten designs, on payment of the stipulated sum of £200 a piece, become the property of the State, and may be appropriated in the preparation of the amended design which shall be finally carried out.

NATIONAL GALLERY.—The annual report of Mr. Boxall, the director, contains interesting items. No less than ten pictures have been repaired, or cleaned and varnished, of which we gave early intimation. During the year 1866 five purchases were made, at the cost of £8,160; of these the most important was the Rembrandt, on which was expended £7,000. Mr. Boxall adds valuable historic notes in elucidation of these recently-acquired works. Among donations are "The Remorse of Judas," painted and presented by Mr. Armitage, A.R.A., and a marble bust of the late William Mulready, R.A., executed by a brother academican, Mr. Weeks. Both these works were exhibited in last academy. It is recorded that the bust of Mulready was "executed at the request of a number of his friends—artists and lovers of art—in admiration of his genius as a painter, and by them presented to the nation." The pictures by the old masters, in Trafalgar-square, have been visited by 775,901 persons, and the British school at South Kensington by 756,075. It is stated that "curtains have been placed before the Turner drawings now on the walls at South Kensington, to protect them from the action of light during the time they are not publicly exhibited." The average daily attendance of students for copying has been in Trafalgar-square, 28, at South Kensington, 25. In the former gallery were made 97 copies in oil, at the latter 121. It appears that Raphael's "Garvagh Madonna," which cost £9,000, has been in greatest request; the picture has been copied nine times. The most popular pictures at Kensington are Reynolds's "Heads of Angels" and "The Age of Innocence;" the one has been copied nine times, the other seven. Dyckman's "Blind Beggar" also still continues a prime favourite; it too has been copied seven times.

Manufactures.

COAL-CUTTING BY MACHINERY.—It has been already announced in the *Journal* that the members of the South Lancashire and Cheshire Coal Association have determined on inviting competition for the best coal-cutting machine, and the committee of referees appointed by

the Association have issued the following regulations in the guidance of competitors:—1. That compressed air is the proper motive power for working coal-cutting machinery. Machinery for compressing air is already erected at several collieries in the neighbourhood of Wigan, and will be placed at the service of competitors. 2. Inventors taking a prize must be bound by the condition that no annual payment, or tonnage royalty, or patent right, shall be charged to any present or future member of the above Association, but that such member shall pay a patent right on the purchase of such machine, to include the working thereof, which patent right shall in no case exceed 50 per cent. of the cost of the machine. 3. The committee reserve power not to award any premium unless they are satisfied with the performance and capabilities of the machine or machines submitted for trial. 4. Machines furnished for trial on November 1, 1867, will be tried by the committee, and will make their award thereupon in or before the end of May, 1868. 5. The committee direct the attention of competitors to the following requirements to which machines must be adapted:—Thickness of seams from 2ft. to 9ft.; dip, or inclination, from horizontal to an angle of 20 degrees; as to weight of machine, lightness and easiness of movement desirable; maximum size of tub or waggon used in the mines, 3ft. 6in. by 3ft. 3ft. in height; gauge of road, from 1ft. 6in. to 2ft. 6in.

WATCHMAKING AT BESANCON.—The *Annuaire du Jura* gives the following account of the watch trade of Besancon. During the year 1865 there were submitted to the local stamp-office 296,012 watches, of which 95,594 were in gold cases, and the rest in silver; of the total number 3,192 only were marked for exportation. The trade of Besancon was founded in 1792, and it is practically the only watch-making district in France, for during the whole of the year 1865 there were only 31 gold and 6,495 silver watches made elsewhere in France, and these 28 gold, and 6,340 silver were made in Paris. The total number of watches submitted to the stamp-office in 1865, including foreign as well as French, was 373,196, and of this number Besancon supplied more than 90 per cent.

Commerce.

FISH AND OYSTERS IN FRANCE.—In the exposure of the situation of the Empire, appears the following account of the supply of fish and mollusks:—In 1865 the quantity of fish sold amounted to more than £1,640,000, and the fisheries employed 15,898 boats, and 57,961 men. Comparing that year with the preceding, we find an increase of £214,493 in the value of the fish, 470 boats, and 1,660 men. There were 1,340 beds, or parks of oysters formed in 1866, and 1,966 in 1865. At the present moment there exist 37,000 parks for the deposit or rearing of oysters, independent of 18,000 oyster beds, constructed on the banks of the Soudre, covering an extent of 15,000 acres.

FLAX IN ALGERIA.—France imports, at present, a large quantity of flax seed from Riga; but the Governor-General of Algeria conceived the idea that it might be produced advantageously in that country, and commissioned M. Farnèze Favarcy, of Lille, to make trial of the matter. The first attempts, in 1865, were not successful. The wrong kind of seed seems to have been selected, and, moreover, the season was exceptionally bad. Last year the experiment was renewed at thirty different localities, in France, Belgium, Holland, and Germany, with seed grown in Algeria, and, without question, of the true Riga variety, with blue flowers, and the success is reported to have been complete. The plants have universally grown more rapidly than those produced from seed coming direct from Riga, and attained greater development, having a single stalk, good tap roots, and abundance of seed, large and shining.

the results obtained from seed sown in May, in places where late flax is cultivated, are said to have been equally satisfactory. In all instances the retting is said to have taken place in the best possible conditions by the various processes adopted in the north of France, that is to say by dew, stagnant water, running water, and the ergues method. The average yield of fibre was 25 per cent., which is the maximum of the best French flax; and the quality is reported to be superior to that obtained from Riga seed. The inference drawn is that Riga flax, which degenerates in France very rapidly, acquires unusual vigour in Algeria, and that when sown in the north of France as summer flax, it loses none of its primitive qualities, and that therefore the production of the seed in Algeria ought to be a profitable undertaking. But there is another and very important element to be taken into consideration, namely, price. The true Riga seed is at present cheaper than usual, but it costs, at Dunkirk, freight and insurance included, 45 to 50 francs the quintal; the Flemish seed generally fetches about 5 francs less than the Russian, and it appears that the Algerian seed may be produced at a price not exceeding that of the Flemish.

Colonies.

THE PASTORAL INTEREST IN NEW SOUTH WALES.—A Sydney paper says that the hopes of the squatters are at their highest, and that they were never in a better position than they now are. Their flocks and herds are in first-rate condition—their runs are clad in verdure, plentifully supplied with water, and they are able to get high prices for their beeves and muttons. The shearing had been concluded, though the difficulty of obtaining shearers and washers had in some parts of the country retarded operations a great deal. The yield of wool this year is very large, and the average weight of fleece a good.

STATS OF QUEENSLAND.—In the pastoral district the production of wool and the average increase in the quantity of stock exceed former years. The gold-fields are finding remunerative employment for a large number of men; copper-mining and the coal-fields are becoming more productive; and agriculture is extending, and the results obtained in the last year or two have established it in the public opinion as a profitable occupation. The imports of farm produce are being fast shut out of the market, with the exception of flour, for which the colony is still dependent upon other colonies. The growth of wheat is, however, rapidly extending. The experience of the past year has established cotton in the neighbourhood of Ipswich and in some other districts—another successful year will have the same effect all over this portion of the colony. A large amount of capital has been invested in sugar-growing, with every prospect of success, for that the cane thrives well has already been proved, and the machinery is in course of erection. The small quantities of sugar already manufactured show that experience only is required to ensure that end. On the other hand, however, in all the towns of this colony complaints are rife of the bad state of trade, and money is not to be had anywhere. The fact seems to be that the colonists have been over trading, the extent of the business operations having been out of all proportion to the population, and still more in excess of the income of the colony, annually produced from its own resources. It is unreasonable to expect that the large number of people who have landed there within the last three or four years should be able to settle down permanently in their places at once. Those who have been accustomed to the life of a farmer at home, and who, having brought with them some little means, have gone into the country and settled on their own land, are almost invariably doing well. But the majority of

those arriving in the colony have preferred a town life, and the extensive building operations, and other improvements going on, have enabled them to find employment without going into the country. Immigration has ceased for a time, financial difficulties have stopped improvements to a great extent, and everything connected with the building trade is in a state of stagnation, numbers of tradesmen and labourers being thrown out of work.

WHEAT FROM VICTORIA.—A Melbourne paper says that although experimental shipments of wheat have been made to London from the colony of South Australia, this is the first season in which the business has been entered into upon a large scale, either from this colony or from the one before mentioned. One ship in Hobson's Bay had 600 tons of wheat on board for Great Britain, and other considerable parcels have been bought for that market. As high as 5s. 6d. per bushel has been paid for wheat for export, and the success of these shipments will be watched with much interest. Heretofore, the neighbouring colony has found a ready market for its surplus produce in Victoria, but in future the latter is likely to grow enough for itself.

Obituary.

THE DEAN OF HEREFORD.—The Very Rev. Richard Dawes, Dean of Hereford, died at the deanery, on Sunday, the 10th inst., after a long illness. The late Dean was born in the North Riding of Yorkshire, in 1797, and educated at the school of Mr. Rolfe, near Kendal. It was here that Mr. Dawes first met Whewell, who was three years his senior—a difference of age which permitted the former companions at school to stand in the relations of tutor and pupil at Trinity College, Cambridge. Mr. Dawes was fourth wrangler of his year (B.A., 1817; M.A., 1820), and was shortly afterwards elected fellow and mathematical tutor of Downing College. In 1838 he accepted the living of King's Somborne, in Hants, which he found one of the worst, and which his conscientious diligence made one of the best parishes in the county. When he went, there was no school there, no squire to help to found one, no farmer who was not opposed to the work of popular education; but Mr. Dawes' zeal and industry supplied every want, and in a few years the King's Somborne school was pointed to far and wide as a model, and eulogised by school inspectors. An account of this school was given by the Dean in a paper read before the Society of Arts, in April, 1853, entitled, "Remarks on the importance of giving a self-supporting character, as far as possible, to Schools for the Labouring Classes, and the means of doing so." When he accepted the deanery of Hereford, in 1850, the bishop and clergy of the diocese united to present him with a testimonial; but what pleased him even more than this mark of kindness was that the very farmers, who, in the first instance, strenuously opposed him, came to thank him for the good he had done. His exertions in the same cause were not slackened by his new position. He acted for several years as the Society's Examiner in "Domestic Economy," and always evinced the greatest interest in its proceedings, especially those having reference to education.

Publications Issued.

NATURE AND ART. (Day and Son).—The first volume of this periodical, which comes out monthly, is just completed. The object and scope of the periodical are very wide; they may be said to be to draw attention to all

that is interesting in nature and art. The illustrations are numerous. Wood engraving, chromo-lithography, and photo-lithography are pressed into the service.

Notes.

THE MANURE OF CITIES.—The city of Bordeaux is in a difficulty about its refuse; contractors complain of the trouble they find in getting rid of some forty thousand tons a year. The authorities, after having received considerable sums of money for the manure of the town, are at present obliged to pay about £20 a day to get rid of the mere refuse and sweepings of the streets, not including road sweepings and sewage. It seems scarcely credible, but is positively asserted, that the refuse of Bordeaux is used by the cultivators of Isle and Dordogne, at a distance of fifty or sixty miles from Bordeaux, while in the neighbourhood of the last-named place not a ton is employed. The last contractor, thinking that the proprietors of the lands would be glad to take advantage of the facilities offered by the Bayonne Railway and the rival roads for procuring manure, hired the ground belonging to the station of the Southern Railway, and there collected a mountain of refuse; nobody would have it, and it is gradually rotting away where it stands. It would naturally be supposed that the manure was not worth having, but the contrary is proved by long experience; the very same refuse is advantageously used in the neighbourhood of Perigord, although the purchasers have to pay the expense of river conveyance, which occupies fifteen days, and some other expenses. Scientific and practical men are now making great efforts to waken the agriculturists of the neighbourhood of Bordeaux to the fact that they are allowing this source of prosperity to lie unheeded at their doors.

Correspondence.

THE WATER SUPPLY OF LONDON.—SIR,—The paper upon this subject read by Mr. Beggs on the evening of the 20th Feb., shows that the views of that gentleman are perfectly correct, and is of the greater value on account of the discussion, carried on by eminent men, which followed the reading of the paper. That the supply of water to the inhabitants of the metropolis should be constant, with the mains always charged, is a question that admits of no doubt, and the various objections regarding waste and bursting are wholly untemple—that is to say, provided the supply taps be invariably fixed within the dwelling house, and not in the yard, unless under special circumstances and paid for accordingly, as the dripping or running of water taps in kitchen, chamber, or passage, would not be allowed one moment longer than necessary for the drawing of the water. In regard to the taps themselves, the high pressure stop-cocks, now in universal use, are tight and easy to turn, while the old conical plug tap is always either leaky, or too tight to turn with moderate force. The modern stop-cock can also be taken out and repaired without the assistance of the plumber. The fear of bursting has no foundation in fact, excepting in the case of severe frost, which must be provided against by never exposing either pipe or tap to the open air. It is also objected that much time will be lost when large quantities of water may be required quickly, but such is not the case, for, by turning the modern tap more or less, a tumbler or a bucketful may be drawn in the same time. In this town of Reading we have a constant supply, at high pressure, and I have frequently attached a hose and branch pipe to the tap we have in the garden, when the water has played over the roof of the house. I may also state that we have here

two separate water-works, but both belong to one company. The old works supply unfiltered water to the streets and other purposes, while the new supply to the town with filtered water, also at high pressure, and payment or rating is per tap, with unlimited supply, and with the recommendation to allow of no unnecessary waste, except watering the garden in summer. The payment by meter, often out of order, is radically bad, because by that mode we endeavour to measure large volumes of water by means of infinitesimal measurements, always a source of considerable error. The rating must, therefore, be for each tap of a certain size; and where dwelling is let to several distinct families, then a family must be provided with its own stop-cock, to be placed, as usually the case, over a sink or waste pipe, so that the users should be compelled to keep a pail to catch the drippings, or waste, which, under such circumstances, will be little or nothing to speak of. It is objected that the change from intermittent to a constant supply will cause great expenditure and inconvenience, but such will not be found to be the fact, for the expense will be the cost of a few yards of service pipe and a tap, when in nine cases out of ten the sale of the old and complicated traps will more than compensate for the trifling outlay. Some difficulty might, perhaps, be anticipated in dealing with the dwellings in the poorer districts, where each house is let in many different tenements. But here again there is ample remedy at hand—viz., those persons who let such tenements must be made responsible for any breach of the laws of health, of cleanliness, and of morality, and should not be allowed to let their tenements to many distinct families without providing water supply to each floor or flat. If, as in many cases, the real landlord cannot be discovered, there is always a ground landlord, and he can be found, fined, and imprisoned for the misconduct that he has allowed to be carried on upon his property. I cannot agree with the storage plan, for the flood waters ought to be confined by permanent embankments, and forced to scour out the beds of our rivers, instead of devastating the country, and causing so much destruction of life and property. The flood waters, loaded with impurities, would have to be rendered clear by deposit and filtration, which latter process will never be carried out in a natural and philosophical manner, until filtration is made to take place upwards instead of downwards, the latter causing the water to be filtered constantly through its own filthy deposit. With regard to the question of supply, it is only by a perversion of nature, the ignorance and misdeeds of man, that towns are prevented from making use of the rivers that flow so abundantly at their feet. Again, I assert that if all dams, weirs, and other impediments were entirely cleared away, and our rivers permanently embanked; if all ordure, noxious impurities, and contaminations, were prevented from passing into the stream, there would be no difficulty in obtaining a supply of good water, to any required amount, within half a mile of any town, and at a very small comparative cost. Rivers form the natural drain of the country through which they flow, and it is flying in the face of an all-bountiful Providence to place any check or impediment in the free course of our rivers and their tributaries, from their spring head to their outlet into the sea. The two towns which I have found to be best supplied with soft pure water, and in which no machinery whatever is used, are Cape Town (Table Bay) and the city of Rome. In both the supply is constant and unlimited. The former is supplied by a spring at the foot of Table Mountain, in quantity sufficient to turn several mills. The city of Rome, although every house and garden has a well of good water, is furnished in addition with a superabundance of fine water by means of the aqueducts still remaining. All the fountains in Rome, both public and private, play night and day all the year round; and all water not used runs away into the Tiber. The Acqua Paulina enters Rome at such a

height as to drive several flour mills in succession before it reaches the fountains. The Aqqua del Ape is in the Vatican, and forms a small fountain, which supplies the Pope's palace with the purest water imaginable, and is therefore called the "Fountain of the Bee." When Queen Christina, of Sweden, was shown the well-known great fountains in the Piazza di San Pietro, she said they were very grand, but she had seen them enough, and they might be stopped now. "Please your Majesty," was the reply, "they have played for more than a hundred years, night and day continually."—I am, &c., HENRY W. REVELLEY.

Reading, 27th Feb.

STORM SIGNALS.—SIR,—As your reporter appears to have misunderstood several of the observations I made on Wednesday evening, the 6th inst., I shall be obliged by your inserting the following corrections:—In the first place, the wave of barometric pressure which seemed to have travelled from Shanghai over Europe, to Montreal, in Canada, indicated a pressure at Shanghai of nearly 31 inches at Montreal, instead of 20 inches, as printed. In the next place, in illustration of great differences of pressure taking place within limited distances, I stated that on board a ship, in a cyclone, off the Malabar coast, the barometer stood at 28 inches (not 20 inches, which I suppose is a misprint), while a barometer at Ootacamund, within 100 miles, reduced to the level of the sea, stood at 30 inches, so that within 100 miles there was a difference of atmospheric pressure of two inches of mercury. In the next place, I did not say that a similar bulletin to Mons. Le Verrier's daily weather bulletin from Paris was issued in other capitals in Europe, but that storm signals, or warnings, had been practised by the celebrated Kupfer, of St. Petersburg, and by Mons. Bellot, of Utrecht, the latter of whom was so jealous of Admiral Fitzroy's reputation of being the first proposer of storm signals that he has made a claim to having preceded Admiral Fitzroy in the matter. The next correction is that I did not say that the Meteorological Committee of the Royal Society had already cost £10,200, but that the proposed cost was to be £10,200, with an outfit of £500. Finally, I did not say that a westerly wind came from a dry climate (a misprint, probably, for northerly and easterly), for westerly winds, particularly those with points of southing in them, bring aqueous vapour with them from the Atlantic, and the barometer falls as the dew point rises; but with winds from the north and east the barometer may be high in England with stormy winds, as I see was the case at Shanghai, in China, on the 15th January, 1867; with a strong north-east wind the barometer stood at 30·77 inches and the thermometer at 46 deg. N.B.—There is a misprint of 72 meteorological stations in Scotland for 55.—I am, &c., W. H. SYKES.

7, Abchurch-lane, Hyde-park, 9th March, 1867.

MEETINGS FOR THE ENSUING WEEK.

- WED ...** Society of Arts, 8. Cantor Lecture. Mr. John Hullah, "On Musical and Musical Instruments." London Inst., 7. Mr. G. A. Macfarren, "On the Lyrical Drama." Society of Engineers, 7½. Mr. H. K. Bamber, "On Water and its effects on Steam Boilers." R. United Service Inst., 8½. Major William Palliser, "The Conversion and Rifling of Cast Iron Ordnance." Entomological, 7. Victoria Inst., 8. Discussion on Mr. Warington's paper, "On the Credibility of Darwinism." **THUR ...** Civil Engineers, 8. Discussion upon Captain Tyler's paper, "On Steep Gradients and Sharp Curves on Railways; and (time permitting) Mr. W. A. Brooks, "Memoir on the River Tyne." Statistical, 8. Mr. W. L. Sargent, "On the Progress of Elementary Education." Pathological, 8. Antropological, 8. Royal Inst., 3. Rev. G. Henslow, "On the Practical Study of Botany."

Patents.

From Commissioners of Patents Journal, March 8th.

GRANTS OF PROVISIONAL PROTECTION.

- Armour plates—308—J. Benson.
Atmospheric plates of artificial teeth—306—N. T. Folsom.
Barrels, tilting—411—J. Walton and R. Harlow.
Bench and desk, combined—370—T. R. Jones.
Bobbins—336—W. E. Newton.
Boxes, fastening—282—F. Ashford.
Brace fabrics—286—S. H. Foster.
Breech-loading fire-arms and cartridges—463—M. Walker, G. H. Money, and F. Little.
Breech-loading needle fire-arms and cartridges—445—G. F. Redfern.
Buildings, floors for—460—R. Moreland, jun.
Cans, &c.—437—E. Stevens.
Charcoal box smoothing irons—348—E. Siddaway.
Chimney tops—423—J. Capper.
Cinder shovels, &c.—419—R. George.
Coal, cutting, &c.—457—J. S. Walker.
Corsets—443—W. E. Newton.
Cruet frames, &c.—415—G. Ireland.
Designs in wool, producing—481—L. H. Mahon.
Drilling machines—338—A. B. Brown.
Electro-magnetic engraving machines—364—P. E. Galfie and A. A. Lalance.
Engines—296—E. S. Crease.
Engines—300—D. Greig, R. Burton, and F. Parker.
Fabrics—356—E. Firth.
Fastenings—256—S. Macarthur.
Fibrous materials, spinning, &c.—431—J. Shaw.
Fibrous substances, disintegrating—477—W. Riddell.
Fire-grates and furnaces—370—A. Craig.
Fires, lighting—258—J. F. D. Donnelly.
Food for infants—250—E. V. L. Ebersburg.
Furnaces—210—J. A. Jones and R. Howson.
Furnaces—268—J. Lockwood and H. Shaw.
Gas meters—449—H. Alder.
Gas pressure governors—495—W. E. Hoath.
Glass-blowing—143—W. Bull.
Gun and pistol locks—332—T. Rigby.
Hoists, &c.—310—W. J., and T. Dewhurst.
Horse shoes—318—S. L. Lucena.
Horticultural buildings—294—W. Richardson.
Hurdles, &c.—475—J. Sainy.
Infants' feeding-bottles, &c.—207—J. Nodder.
Iron and steel, uniting—469—W. B. Adams.
Iron, &c., vitrifying—322—J. Hallouhey.
Kilns and ovens—290—J. G. Robinson.
Limestone and cement, calculating—471—H. Wadkin and C. Shapard.
Liquids, filtering—330—G. A. Waller.
Lock spindles, adjustable—455—M. Cavanagh.
Locks—306—M. Cockerell.
Lubricating apparatus—467—W. S. Gamble.
Mathematical instruments—433—G. White.
Mechanical movements—352—W. Clark.
Metal, moving, &c.—342—G. Ramsbottom.
Mines, &c., lighting—262—H. R. Fanshawe.
Needles—302—C. P. S. Wardwell.

- Oakum—451—E. Brasier.
Oils, preparing—344—G. E. Fain and C. Corroy.
Paper—294—B. Hunt.
Pearls or beads, artificial—331—C. E. Brooman.
Penholders, reservoir—288—J. Darling.
Pipes, junctions of—365—W. Jones.
Power loom lathes—437—W. W. Urquhart and J. Lindsay.
Power, transmitting—248—T. C. Eastwistle.
Printing machines, cylinders—427—T. W. Nicholson.

Journal of the Society of Arts.

FRIDAY, MARCH 22, 1867.

Announcements by the Council.

ORDINARY MEETINGS.

Wednesday Evenings at Eight o'Clock:—

MARCH 27.—“On Flax, and Improved Machinery for Preparation.” By CHAS. F. T. YOUNG, Esq., C.E., Camb. Soc. Engineers, Assoc. Inst. N.A.

CANTOR LECTURES.

A Course of Lectures “On Music and Musical Instruments,” by JOHN HULLAH, Esq., now being delivered as follows:—

LECTURE IV.—MONDAY, MARCH 25.

MUSICAL NOTATION.—Different Systems, Alphabetical and Special—Neumas—Accents—Lines and Spaces—The Time Table—Modern Notation; its Origin and Growth, Simplicity and Fitness.

LECTURE V.—MONDAY, APRIL 1.

MUSICAL INSTRUMENTS.—Classification—Wind Instruments—Stringed Instruments—The Plectrum, Hammer, and Bow—Instruments of the Ancients—Medieval Instruments; their Introduction into the Church.

LECTURE VI.—MONDAY, APRIL 8.

MUSICAL INSTRUMENTS (continued).—Modern Instruments—Chamber and Orchestral—Combination—The Modern Orchestra—Conclusion.

The lectures commence each evening at eight o'clock, and are open to members, each of whom has the privilege of introducing one friend to each lecture.

EXAMINATIONS, 1867.

In addition to the prizes announced in the Programme of Examinations, the following are offered:—

The Worshipful Company of Coach and Coach Harness Makers offer a prize of £3 in Freehand Drawing, and a prize of £2 in Practical Mechanic, to the candidates who, being employed in the coachmaking trade, obtain the highest number of marks, with a certificate, in those subjects respectively.

The Worshipful Company of Goldsmiths offer three prizes—of £5, £3, and £2 respectively—to the three candidates who, being employed on works in the precious metals in any part of the United Kingdom, shall obtain from the examiners the first, second, and next highest number of marks, such prizes to be distinguished as the “Goldsmiths’ Company’s Prizes.”

SUBSCRIPTIONS.

The Christmas subscriptions are due, and should be forwarded by cheque or Post-office

order, crossed “Coutts and Co.,” and made payable to Mr. Samuel Thomas Davenport, Financial Officer.

Proceedings of the Society.

FOOD COMMITTEE.

A meeting of the General Committee on the Food of the People was held on the 20th inst., at twelve o'clock. Present—The Right Hon. Henry Austin Bruce, M.P., in the chair; Mr. Harry Chester, Mr. C. Wren Hoskyns, Mr. Clare S. Read, M.P., Mr. McLagan, M.P., Mr. B. Shaw, Mr. F. Parish, Mr. Edward Wilson, Mr. James Ware, Mr. Slater-Booth, M.P., and Mr. Ludford White.

The CHAIRMAN said, as business compelling him to leave London had prevented his attendance at some of the meetings of the Sub-Committees, he would ask Mr. Chester, who had been present at all of them, to report what had been done.
